public health during his stay, and spent some time in the office of the American Public Health Association.

LEO KAPRIO, M.D., M.P.H., who has recently completed his course at the Johns Hopkins School of Hygiene and Public Health, Baltimore, Md., will return to Helsinki, Finland, to become Secretary of the Finnish Public Health Association, succeeding ERKKI LEPPÖ, M.D.

ERKKI LEPPÖ, M.D., of Helsinki, Finland, who has been Secretary of the Finnish Public Health Association, which has just completed its 10th year, has been appointed to a medical post in the World Health Organization staff in Geneva, Switzerland, in connection with the maternal and child health program.

MARION YANG, M.D.,* of the staff of the Chinese Ministry of Health, Nanking, has been elected a member of the Legislative Yuan and has left the United States, where she was traveling in a study of maternal and child health services, to attend the first sessions in Nanking.

Deaths

PHILIP E. BLACKERBY, M.D.,* Kentucky State Health Commissioner since 1943, died at his home in Louisville of a cerebral hemorrhage on June 24, at the age of 66. Dr. Blackerby was elected a member of the Association in 1933 and a Fellow in 1945. He was also a Fellow of the American Medical Association and Secretary of the Kentucky State Medical Society.

JAMES H. HEALD,† Laboratory Director, Southern Dairies, Winston-Salem, N. C., Elected Member of Engineering Section in 1919.

JULIUS A. HENE, M.D.,† New York, N.Y., was killed while a prisoner of war. He was elected as an unaffiliated member of the Association in 1940.

LESLIE A. SANDHOLZER, Ph.D.,* Bacteriologist in Charge, Fishery Technological Laboratory, U. S. Fish and Wildlife Service, College Park, Md. He was elected a member in 1940 and a Fellow in 1944 (Laboratory Section).

WILLIAM M. SMITH, M.D., M.P.H.,* Olean, N. Y., recently Acting State Health Officer of North Dakota. Elected a member in 1938 and a Fellow in 1943 (Health Officers Section).

GEORGE A. SOPER, Ph.D.,* 78, sanitation engineer responsible for the discovery of the famous "Typhoid Mary," died in Southampton Hospital, New York, on June 18. Dr. Soper became a member of the Association in 1895 and a Charter Fellow of the Engineering Section in 1922.

Developments in Child Psychiatry in the United States*

FREDERICK H. ALLEN, M.D.

Director, Philadelphia Child Guidance Clinic; President, American Association of Psychiatric Clinics for Children

CHILD psychiatry is a development within the field of general psychiatry that has taken place in the last quarter century. As the science of understanding human behavior shifted from the laboratory to a study of, and interest in, the living person, it was inevitable that interest should focus on the childhood period and the influences shaping the early personality of the child. Out of this growing need to understand the child from his own experiences, rather than from the retrospective accounts of adults, emerged a clinical field patterned to deal with the unique characteristics of the period in question.

Early emphasis in the clinical programs established to give reality to this new field was on the prevention of adult maladjustments. The objective of the first clinics established in the history-making program sponsored by the Commonwealth Fund, was described as a program for the prevention of delinquency. Dynamic psychiatry pointed to the importance of the childhood

period, and adult disorders were traced back to traumatic influences operating in family and community which warped the child's early life. The earliest clinical efforts had a strong educational flavor and were aimed at educating parents to prevent disturbing influences affecting the lives of their children.

These were important objectives, and from this early period emerged a better understanding of the laws of psychological growth. Equally important was the emergence of a better understanding of how parents and children changed and how professional services could be developed to accelerate this process. It became clear that parents and children sought and needed help, not to prevent some later difficulty, but because of current anxieties and problems. These were the problems that were brought to the clinics and they required special therapeutic effort. While prevention remained as a general objective, it receded as one immediately attainable. The problems of children required skillful attention for what they were—then and there. New professional skills were called for, to help the parents and chil-

* Special Review Article prepared at the request of the Editorial Board.

dren who sought the services of psychiatric clinics. They needed more than good advice and well intentioned prescriptions which pointed out their weaknesses and the way to correct them. It became increasingly clear that they needed help to attain a better understanding of themselves and to arrive at a healthier set of values about themselves and their capacity for responsible living.

The clinical methods that have emerged in the quarter-century in which child psychiatry has flourished have been fashioned by the parents and children who have used the professional services of the psychiatrists, psychiatric social workers, and psychologists who have staffed these clinics. This is too important ever to be forgotten. Professional method has been carved by understanding how parents and children have effected changes in their relationship together, through and with the skillful direction provided by trained professional staffs. By seeking and using such services, parents and children have contributed vital quality both in theory and in clinical practice—child psychiatry has not developed in a vacuum of applied theory.

Another highly important aspect of this professional field concerns our changed conception of the child himself. In early clinical efforts, the child was examined and tested mainly to gain information about him, rather than to help him directly with his own emotional problems. The child was seen as a victim of conditions and not as a participant in them. He was studied more as a product than a dynamic factor in his own growth. There have been great changes in our conception of the child, and these changes have had a profound influence on clinical methods. He is an active participant in the helping process designed to bring about a better adjustment. Even quite young children are included in the thera-

peutic services available in our present-day clinics. No longer are they regarded just as automatons, reflecting unhealthy attitudes of others and incapable of change except as conditions under which they live are changed.

The inclusion of children in the therapeutic program has had profound effects on the nature and quality of the parents' participation in that program. The parents are respected for the part they must take in a clinical service if the child is to be helped. Concurrent interviews with parent and child focus the therapeutic process upon the relationship between parent and child, in which the whole problem is rooted. The characteristics of the childhood period require that this relationship be kept in the foreground in the therapeutic procedures designed to help the child.

Many of our child guidance clinics have learned, out of their experience, the importance of an initial planning period with one or both parents before the child is started on a therapeutic experience. The parent makes the first move to get help and in that first step learns what a clinic service is and how it operates, while sharing with a staff social worker the nature of the problem for which help is sought. In this first move, the parents can bring out the degree of their concern about their child and the part they can take in helping him. Then they have a chance to think it over. If one parent makes this first move, the other parent can be included in the steps they must plan together. The child will need to be told why they are seeking help for him, a step which may be a difficult one for the parents to take, particularly those who are very protective of their child and wish to save him from the anxiety that will be aroused when they tell him they are worried and are taking him to a clinic for help. In some clinics that have given a great deal of thought to this phase of therapy, a second planning

interview is arranged with the social worker who will be the one to go on with the parent. The time given to this has proved of great value for those parents who elect to make the fullest use of the clinic. In the long run, this slower intake process pays rich dividends, not only in helping parents to be together in their common concern, but also in furthering a new sense of value in regard to parental responsibilities. The fact that a clinic recognizes their importance in planning this service for their child, has real significance both for the parents and for the child.

The change toward healthier living needs to come from both child and parent. The burdensome responsibility placed on the parents becomes more realistic when they can be helped to understand that a child has capacity for responsibility, not only as a factor in a problem but as having an important part to play in its solution.

The basic feature of the child guidance clinic is the pooling of the professional skills of the psychiatrist, psychiatric social worker, and psychologist to provide a clinic service in which joint participation of parent and child is made possible. When parents seek the help of this type of clinic, they are helped to realize that it is not just bringing a troubled child to a psychiatrist to be made over and cured. They bring, as well, their own concern and anxiety about their relation to that child who is experiencing difficulties. The problem involves a vital relationship between parent and child. It is neither projected entirely on the child's behavior, nor on what the parents' influence has been in aggravating that problem. Important dynamic forces emerge in the move taken by the parent to seek help—when the clinic service provides both parent and child with the opportunity to participate in finding a healthier balance in their living together.

The collaboration between the pro-

fessional groups needed to build this service for children has been effectively developed in the child guidance clinic. The nature of the childhood period and the problems arising in it have required refinement. Practice varies in different clinics as to the most effective ways of utilizing the different skills of the psychiatrist and the social worker. My own experience has been in a clinic that has developed a clear differentiation between the psychiatrist's therapeutic role with the child and the role of the social case worker in his work with the parent. A parent who seeks the help of a children's clinic, by this choice elects to work on his parental relation to the child rather than on his own adult problems. Many parents who need help with their children do present neurotic problems in themselves. But the child guidance clinic must focus on the parent-child relationship and not get swept into the broader areas of the adult problem. By keeping the child in the central position in the clinic service, the adult as the parent to the child, can also be kept in focus in the help they need and receive. Using the psychiatrist with the central person—the child—and using the social worker's skill in working with the parent, helps to keep the function of the clinic in proper perspective.

Other clinics have developed a different procedure in which the roles of the psychiatrist and social worker vary according to the revealed needs of the parent or of the child. The more disturbed parent may be seen by the psychiatrist and the child by the social worker. It is generally agreed, however, that the social workers who carry such therapeutic responsibility with the child will need special training beyond that received in their basic case work training.

The demand for clinical services for disturbed children is increasing rapidly throughout the United States. The psychiatric clinic for children has become

an established and recognized resource needed by communities, both urban and rural. The structure and setting of these clinics varies and depends upon the relation they bear to other health, social, or educational resources in a community. The most frequent pattern is the child guidance clinic established as an autonomous clinical unit in a community, and having its own staff and administrative structure headed up in a board of directors. The services of such a clinic operate in close relation to schools, courts, health and social agencies, but with an intake policy that allows the clinic freedom in the selection of cases. For example, a court may refer a parent and the clinic would help that parent to assume responsibility for working out a way of using the clinic in accordance with his own need.

Clinics which limit their intake to children up to a certain age, e.g., 16 or 17, usually flourish in our urban communities and, in most instances, in the larger population areas. Other psychiatric clinics for children have developed in different settings to meet a more special need than those established as community clinics. Many public school systems have felt the need of more psychiatric help in strengthening their services relating to the problems of school children. A great many emotional problems grow out of the child's school experience. The schools must deal with these problems, irrespective of the concern a parent may have about the child. Some of our school systems have developed skillful counselling services and could make effective use of trained psychiatrists to strengthen their efforts to effect a better adjustment of the school child.

Some school systems, notably the New York public school system, have developed an extensive child guidance program within the school system. This program more nearly parallels the structure of a community clinic, and provides an extensive therapeutic service for the

referred children. Clinical teams work in different sections of the city and serve the public schools in their particular districts.

The public school psychiatric clinic has a strategic opportunity to help the classroom teachers to gain a broader understanding of their influence on the emotional development of the child. Helping them to become better teachers and to acquire more skill in dealing with the emotionally disturbed child in the classroom, is an important mental hygiene objective. Skillful counselling by trained people who include the teacher in their work, also achieves results in making for a healthier classroom atmosphere for all the children and especially for those having difficulty in adjusting to the school experience.

Development of counselling services in our public schools has been an effective way of strengthening school resources for dealing with a variety of emotional and behavior problems growing out of school life. A good example of this development can be found in the Philadelphia public schools where the personnel of this counselling service have been drawn from qualified teachers who have indicated interest and ability in this school service, and who are then given in-service training. One valuable feature of this program is locating the counsellor right in the school. He is as much a part of the school program as the principal and classroom teacher. These counsellors, in addition to carrying an important service helpful for both the school and the child, provide an important connecting link with essential community resources such as a child guidance clinic. They are in a position to help parents to take their children to the clinic. They provide a necessary channel for effective collaboration between school and clinic in their efforts to help the child to a better adjustment.

There are many who believe that the

child guidance clinic should be developed as an organic part of the school system. One assumption behind this belief is that such a clinic would be more accessible to parents and children and that they would be freer to use such a service than one set up as an independent entity. My own belief, which is shared by many experienced people, is that there is need for both types of service in our large urban centers. The school clinic is needed to strengthen the school in understanding the wide variety of problems growing out of school experience, and operates in close relation to the classroom teacher, the school administrator, and the medical and counselling services. The community clinic, unhampered by the natural authoritative influence of the school, is in position to help parents and children to use the service out of their own concern and need.

One of the most important developments in recent years is growing out of a closer relation between pediatrics and child psychiatry. The pediatrician is in the most strategic position to understand and help the parent and child in the early stages of the child's life. This opportunity grows naturally out of the normal function of the pediatrician who provides a significant psychiatric service without having to be a psychiatrist. His understanding of the fundamentals of the psychological growth process enables him to be extraordinarily helpful in dealing with many of the early anxiety problems of parent and child.

Pediatricians need to have this knowledge incorporated into their training. They need this type of training more than they need special psychiatric clinics in pediatric hospitals. The work being done in the Pediatric Clinic at Cornell is an excellent example of what is needed in every pediatric center, particularly in teaching centers. In this clinic an excellent pediatrician with

sound psychiatric training has woven into the clinic and hospital work and into teaching, his knowledge of what is important for the pediatrician if he is to be a real practitioner in his field.

There is a great need to train more pediatricians in the basic principles and practices of child psychiatry to enable them to assume teaching responsibilities in our medical schools and teaching hospitals. Here is the opportunity for real and positive preventive work. Frequently we hear the demand for more psychiatrists in well baby clinics, but it is my firm belief that a child psychiatrist has no valid place in such a clinic. This is a function belonging to the well trained pediatrician who has a natural opportunity to function effectively in helping parents to achieve a normal relation to their children. Placing psychiatrists in such clinics only serves to relieve the pediatrician of his true responsibility and, in the end, blocks normal progress in such services. Psychiatrists, well trained in child psychiatry, can serve a more important function in helping to train pediatricians to fulfil their natural roles, which require so much more than treating sick children.

Every child guidance clinic deals with some children who are so disturbed that they require special residential care. Providing such facilities with a well trained staff is expensive and can only be done under adequate subsidies. Some progress has been made in developing such facilities and a great deal is being learned about how to make such care effective. A good example of a carefully thought-out program combining good residential care with therapeutic work, is found in the Children's Service Center of Wyoming Valley, at Wilkes-Barre, Pa., which can provide residential care for about sixteen children. One important feature of this program is intake policy which requires a thoughtful planning with the family

for this care. It is important to maintain a working relation with the family in order that the child's gains are not achieved in isolation but in some relation to the family to which he will return. This thoughtful planning becomes a requirement for admission, even when parents live at some distance. This is a feature of residential care that needs to be refined, in all institutions whose primary function is to help the seriously disturbed child.

Other excellent examples of residential care for the disturbed child have developed in the Southard School in Topeka, Kan., at the Orthogenic School in Chicago, and at the Langley-Porter Clinic in San Francisco. The last is located in special quarters in a psychiatric hospital, while the Southard School is a separate part of the Menninger Clinic. All of these clinics provide psychotherapeutic service for the child and are important training centers for professional personnel.

The question frequently arises as to whether such residential facilities should be developed in our adult mental hospitals. My own conviction is that they should not. If they are developed there, it is essential that the quarters should be separate and that specially trained staffs be provided. The latter is difficult to provide because of the lack of opportunity to train adequately those who are charged with the responsibility of operating this service.

A somewhat different clinical service combining skillful therapeutic help with a nursery and kindergarten program is exemplified in The Children's Center of Roxbury, Mass. This clinic provides a group program for disturbed children up to the age of 6 years. The individual therapy is skillfully interwoven into the group program, and enables this clinic to work with many disturbed children who otherwise would require 24 hour care away from home. The parents take an active part in this

service, being a part of the group program and also having the opportunity to participate in the therapy by being helped to work through their own problems as parents. This type of clinic will have an important place in future developments and provides a pattern that could be utilized in our large urban clinics.

Other clinics have been developed to meet the special problems of our juvenile courts. This is a service needed by the court to help toward a better understanding of the problems it must handle. Such clinical services have been mainly diagnostic, and therapeutic only to the extent that the knowledge so gained is used to make disposition and probation more intelligent and effective. Having such a service in our courts does not diminish the need to have good therapeutic services available in the community. In fact, the need for such a clinic usually is increased since the presence of such a clinic enables the court to refer those parents and children who are ready to use services which cannot be provided by a court.

The greatest barrier in expanding psychiatric resources for children is the scarcity of adequately trained personnel. Today a great many communities are ready to develop child guidance clinics and are unable to proceed because of their inability to obtain qualified staff. Significant moves have been made during the past year to correct this serious situation. The most important step to broaden and improve professional training was taken by the federal government when the National Mental Health Act was passed. This Act empowers the U. S. Public Health Service to provide grants-in-aid to recognized and competent training centers to enable them to train more psychiatrists, psychiatric social workers, psychologists, and psychiatric nurses. These are the professional groups needed in developing the country's resources to

deal with mental health problems. In this program, child psychiatry is recognized as one of the important clinical fields to be developed through providing more trained personnel. The three professional groups needed in our psychiatric clinics for children are the psychiatrists, psychiatric social workers, and psychologists.

In addition to the grants-in-aid to qualified training centers, this Act provides for stipends for the students who are qualified to enter a training program in child psychiatry. Psychiatrists are required to have two years in basic psychiatry in a recognized training hospital or clinic before they are eligible to begin this specialized training for child psychiatry. This requirement is a recognition of the fact that child psychiatry is an integral and important part of general psychiatry. But this program also recognizes that training in adult psychiatry does not develop the special professional competence needed in psychotherapeutic work with the emotionally disturbed child.

A third important feature of the National Mental Health Act aims to develop more clinical facilities both for adults and children. To achieve this end, funds are made available to the various states on a matching basis. Each state is required to designate a central state agency administratively responsible for the mental health program, and requires that this agency draw up a program for expanding outpatient clinical facilities. When these programs are approved by the Surgeon General of the U. S. Public Health Service, allocations are made on matching formulae which have been developed.

This program will allow considerable expansion of clinical facilities for children, particularly in communities that have been unable to support a children's clinic. A large proportion of these new clinics will probably provide

a clinical service for both adults and children. The real barrier to the rapid expansion made possible by these federal funds, is the acute shortage of trained personnel in all professional groups, but especially in psychiatry. There is a real danger in this situation because of the temptation to start clinical services for children with personnel who have no qualifications for developing a valid and helpful clinical service for children. On the other hand, there is no prospect in the near future of meeting all these demands with well trained professional people. The present qualified training clinics are few in number and are needed to give the more refined training to meet the need for more teachers capable of assuming training responsibilities.

It is clear that training our professional personnel must be carried on at two levels. Our best training resources, found mainly in the larger communities in the well established psychiatric clinics for children, must be used to train well qualified child psychiatrists. This training program should cover a period of two years. But there is a larger number of psychiatrists who will head up the all-purpose clinics who will need and could effectively use a less intensive type of training. Here again we run into the unanswered question of how and where to provide this training.

The American Board of Psychiatry and Neurology has indicated the desirability of all psychiatrists having 6 months of training in children's work. There is considerable justification for this, but how the end is to be attained is a serious question.

In our efforts to find adequate answers to these problems of personnel, one fact must be kept in the foreground. Standards must be set up and maintained in our training programs, capable of turning out well qualified professional personnel. If these limited re-

for this care. It is important to maintain a working relation with the family in order that the child's gains are not achieved in isolation but in some relation to the family to which he will return. This thoughtful planning becomes a requirement for admission, even when parents live at some distance. Today a great many communities are ready to develop child guidance clinics and are unable to proceed because of their inability to obtain qualified staff. Significant moves have been made during the past year to correct this serious situation. The most important step to broaden and improve professional training was taken by the federal government when the National Mental Health Act was passed. This Act empowers the U. S. Public Health Service to provide grants-in-aid to recognized and competent training centers to enable them to train more psychiatrists, psychiatric social workers, psychologists, and psychiatric nurses. These are the professional groups needed in developing the country's resources to

deal with mental health problems. In this program, child psychiatry is recognized as one of the important clinical fields to be developed through providing more trained personnel. The three professional groups needed in our psychiatric clinics for children are the psychiatrists, psychiatric social workers, and psychologists.

In addition to the grants-in-aid to qualified training centers, this Act provides for stipends for the students who are qualified to enter a training program in child psychiatry. Psychiatrists are required to have two years in basic psychiatry in a recognized training hospital or clinic before they are eligible to begin this specialized training for child psychiatry. This requirement is a recognition of the fact that child psychiatry is an integral and important part of general psychiatry. But this program also recognizes that training in adult psychiatry does not develop the special professional competence needed in psychotherapeutic work with the emotionally disturbed child.

A third important feature of the National Mental Health Act aims to develop more clinical facilities both for adults and children. To achieve this end, funds are made available to the various states on a matching basis. Each state is required to designate a central state agency administratively responsible for the mental health program, and requires that this agency draw up a program for expanding outpatient clinical facilities. When these programs are approved by the Surgeon General of the U. S. Public Health Service, allocations are made on matching formulae which have been developed.

This program will allow considerable expansion of clinical facilities for children, particularly in communities that have been unable to support a children's clinic. A large proportion of these new clinics will probably provide

a clinical service for both adults and children. The real barrier to the rapid expansion made possible by these federal funds, is the acute shortage of trained personnel in all professional groups, but especially in psychiatry. There is a real danger in this situation because of the temptation to start clinical services for children with personnel who have no qualifications for developing a valid and helpful clinical service for children. On the other hand, there is no prospect in the near future of meeting all these demands with well trained professional people. The present qualified training clinics are few in number and are needed to give the more refined training to meet the need for more teachers capable of assuming training responsibilities.

It is clear that training our professional personnel must be carried on at two levels. Our best training resources, found mainly in the larger communities in the well established psychiatric clinics for children, must be used to train well qualified child psychiatrists. This training program should cover a period of two years. But there is a larger number of psychiatrists who will head up the all-purpose clinics who will need and could effectively use a less intensive type of training. Here again we run into the unanswered question of how and where to provide this training.

The American Board of Psychiatry and Neurology has indicated the desirability of all psychiatrists having 6 months of training in children's work. There is considerable justification for this, but how the end is to be attained is a serious question.

In our efforts to find adequate answers to these problems of personnel, one fact must be kept in the foreground. Standards must be set up and maintained in our training programs, capable of turning out well qualified professional personnel. If these limited re-

sources are used for the more expedient type of training, to enable more communities to use federal funds, there would be a real danger of pulling all training down to this level and blocking the essential development of this professional field. Too many clinics have been started to offer help to a troubled parent and child and end up by offering very little real professional help. Parents and children needing skillful help have a right to expect good service, and the professional field suffers when it is not provided. Too many clinics started with a low level of professional competence have remained at the level at which they started, and have the effect of lowering the professional status of this clinical field.

Another important development in this field occurred with the forming of the Association of Psychiatric Clinics for Children. This Association grew out of the clinical field itself and represented a need to establish standards and assist established clinics and those being started, to maintain standards of service which the accumulated experience of our clinics indicates as essential. At the present time this Association has 39 active members and 7 associate members. This is an association of clinics and not of individuals, and membership is limited to those clinics which have trained staffs of psychiatrists, psychiatric social workers, and psychologists. Part-time clinics employing competent staffs have been included as associate members, while the clinics with a full-time staff are eligible for active membership.

This Association will play an influential role in maintaining standards for professional training and has, as one of its important functions, the evaluation of the training programs of clinics which are doing training and of those clinics asking for approval as training centers. The Association is in a strategic position to strengthen the

training resources of the United States and will be in a position to help those administering the National Mental Health program to select clinics that should be subsidized in order to broaden their training programs.

In 1922, when the Commonwealth Fund started its program to develop child guidance clinics, they turned over to the National Committee for Mental Hygiene the responsibility of providing professional leadership to this whole program. The Division of Community Clinics was established with competent leadership. The Association of Psychiatric Clinics for Children was the natural outgrowth of this work, and today the National Committee for Mental Hygiene provides the field work service for the Association. The Executive Assistant for the Association is on the staff of the National Committee.

The selection of qualified candidates for training in approved training centers is an important job. The final selection of the candidates must be left to the training center in which the fellow will receive his training. But the preliminary screening of the considerable number of psychiatrists desiring this training is being carried on by the Association and its Committee on Training. This is a big job that needs to be centralized. Candidates ready for assignment can be informed of available training resources and be given the opportunity to apply to the clinic of their own choice. This clears the way for the clinic and the student to work through a selection process that is satisfactory to both clinic and student. For students receiving National Mental Health Act stipends, the clinic must nominate the candidate and send these nominations to the Surgeon General of the Public Health Service for final action.

The future of this all-important field is one full of promise. The fact that there is a rapidly increasing demand for serv-

ice in every one of the established clinics, is an indication of the growing confidence that is emerging in our communities in their value. They have provided important clinical laboratories for the development and refinement of clinical method by which parents and children have been helped to a healthier way of living together. In these clinics, psychiatrists, social workers, and psychologists have learned how to pool their separate professional skills to build a clinic service that can be effectively used by parents and children. The nature of the childhood period requires this professional collaboration and our clinics for children have made effective use of this opportunity. Today, we find increasing emphasis on the need of the psychiatric team in all phases of a mental health program in our hospitals, adult clinics, and in our military service. The work done in

our child guidance clinics is, in a large measure, responsible for this refinement.

Advances in better understanding and application of psychotherapeutic principles have come from the work of these clinics for children. These principles are based on the respect for what a parent and child can do in effecting the changes necessary for healthier living. Psychotherapy must rest on this positive approach to human behavior which seeks to strengthen capacity for responsibility. Building on what parents and children have, rather than stressing their liabilities and mistakes, has been an approach that has been basic in working with parents and children. By their participation in a clinic service provided by trained clinic staff, they have built a clinical method that, today, is effective in restoring a great many parents and children to a healthier balance in their living together.

Yale Expands Cancer Control Training

A training program for cancer control officers will begin at Yale's Department of Public Health through a grant from the National Cancer Institute.

Developed to meet the needs of administrators of cancer programs, statistical epidemiologists, health educators, and public health nurses, the program will require at least one year. It will include basic courses in the principles of social science, public health, and medical care organizations as well as specialized cancer control instruction. With the rank of Associate Professor, Edward M. Cohart, M.D., Regional Cancer Consultant, U. S. Public

Health Service, will head the program.

Physicians with at least two years' practice or comparable experience, nurses and others with the Bachelor's degree and with three years' experience in medical care, dental care, or public health work are eligible for the training leading to the Master's or Doctor's degree in Public Health. Special students, not candidates for degrees, with appropriate training and experience may also be admitted. Apply Dr. E. M. Cohart, Cancer Control Section, Department of Public Health, Yale University, School of Medicine, 310 Cedar Street, New Haven 11, Conn.

Newly Proposed Staining Formulas for the Direct Microscopic Examination of Milk*

B. S. LEVINE, PH.D., F.A.P.H.A., AND L. A. BLACK, PH.D.,
F.A.P.H.A.

Senior Bacteriologists, U. S. Public Health Service, Cincinnati, Ohio

A PROCEDURE most satisfactory for staining milk films should make possible the counting of a maximal number of bacteria present in a given volume of the milk. In a previous publication reporting comparative studies of well known milk staining procedures, we pointed out that they all failed to yield such maximal bacterial counts consistently,¹ and emphasized the factors responsible for such failures. Based on the studies then reported, we expressed the belief that improved procedures for staining milk films could be developed. It is our further belief that only by following certain known and appropriate physicochemical principles can further progress be attained in the development of a procedure most satisfactory for staining milk films.

ADSORPTION IN STAINING MILK FILMS

In the investigations reported upon in the present paper, we assumed that the process of staining milk films generally follows the principles underlying the phenomenon of adsorption.^{2, 3} For the purpose of our investigations, we define adsorption as the physicochemical phenomenon consisting in the concentration or adhesion of the molecules of

the dissolved methylene blue dye, in their dissociated or undissociated state, at the surfaces of the solid bodies with which they are in contact, that is, at the surfaces of the milk proteins and of the various organized cells which have been fixed to the glass slide. The phenomenon of adsorption is characterized by certain generally accepted manifestations. Those which have a bearing upon our investigation are:

1. The substance adsorbed can be eluted and thereby regained in its original state. It is upon this property of the adsorbed dye that complete destaining of milk films depends. The eluted dye, if allowed to concentrate sufficiently, will stain milk films in the same manner as it did originally, thereby indicating that the dye has been regained in its original state.

2. In solutions of the same substance in different solvents, the greatest adsorption occurs in that solution whose solvent possesses the highest surface tension. Water has a surface tension of 72.75 dynes per centimeter at 20° C., which is the highest tension of all other solvents used in connection with the methylene blue dye as applied to staining milk films. This explains the observation recorded by us in a previous publication,¹ namely, that aqueous solutions of methylene blue readily give up the dye to the milk proteins of the

* From the Milk and Food Sanitation Laboratory, Water and Sanitation Investigations Station, Cincinnati, Ohio.

background, and cause frequent over-staining.

3. The amount of adsorption is conditioned by the extent and the nature of the surface exposed. It is reasonable to assume that with the difference in the size of bacteria, their species and ages, adsorption of the methylene blue dye at their surfaces, that is, the intensity with which they stain, should differ from only slightly darker than the intensity of the background to very dark blue. It is because of this principle of adsorption that we emphasize in the preceding paper¹ that strong staining contrasts are attained at the expense of the delicacy in color shades, which in turn results in the loss of visibility of numerous bacteria whose adsorptive power for the dye is only slightly greater than that of the milk proteins forming the background of the film. To this must be added the fact that the adsorptive power of the surface of many bacteria may be considerably influenced or completely masked by the layer of milk proteins covering them.

4. The adsorption concentration is also conditioned by the pressure or concentration of the adsorbate. Had this not been true in the case of methylene blue dye as a staining medium, that is, had the reaction been a true stoichiometric one, a definite maximum of the reaction would always be obtained, and no overstaining would take place, since the excess of uncombined dye molecules could be easily and completely removed by rinsing and washing, without any destaining effects.

5. At lower temperatures, the speed of migration of the molecules of the material in solution toward the adsorbing surfaces of the suspended solids is slowed up, but the ultimate concentration is higher. We found this to be true of methylene blue solutions in relation to suspended milk smears. Staining procedures were carried out at 20° C. and 4.5° C., and the results com-

pared. We found that in the cold staining, a higher degree of differential staining could be attained. If the slides were removed at just the proper time and rinsed, the milk proteins, not having attained the maximum dye concentration, remained somewhat lighter, while the organized cells stained darker than they did at 20° C. This is a point of interest which presents possibilities for further studies in milk film staining with methylene blue.

6. The ionization or non-ionization, or the degree of ionization of the dissolved dye, depending upon the nature of the adsorbing substance, determines the polarity or non-polarity of the reaction. While it is generally believed that in both polar and non-polar adsorption the exponential law expressed by the adsorption isotherm is valid, the original electrical balance of the dye solution may be affected. Methylene blue hydrochloride is strongly ionized in aqueous solution, and since, in the case of milk films, the insoluble adsorbents, represented by the milk proteins and organized cells fixed to the slide, adsorb only the cations of the dye, the chlorides tend to remain in the solution. The electrical balance of the original dye solution is thereby altered. This poses the question as to how long the same dye solution can be used and still be expected to produce the same results as the original solution. This theoretical consideration also points to the undesirability of mixing used and unused staining solutions. In this connection we found in our investigations that frequent changing to new dye solutions is desirable. This is especially true of dye solutions of comparatively low concentrations.

ACID AND WATER-FREE METHYLENE BLUE SOLUTION

From our previous studies¹ and the theoretical discussion presented in the preceding paragraphs, it appears that

the search for a satisfactory staining solution for milk films should be limited to simple solution systems, that is, solutions containing the minimum of chemical reagents, and that the solvent for the methylene blue dye should have a comparatively low surface tension in order that differential staining effects as regards intensity of staining may be best attained. This would at once exclude aqueous solutions of the dye, and dye solutions which contain high concentrations of acids and other chemicals. Ethyl alcohol as used in laboratories contains only 5 per cent of water, at 20° C., generally regarded as room temperature, its surface tension is only 22.3 dynes per cm., compared with 72.75 dynes for water. It was felt, therefore, that the solution to the problem might be found in the use of ethyl alcohol as the only dye solvent.

Accordingly, concentrations of the dye in alcohol, varying from 1.2 per cent down to 0.1 per cent were used for the staining of milk films. We found that a 0.6 per cent concentration of the dye in alcohol gave the best results. A number of milk films were defatted and stained for one minute. Under the microscope the milk proteins appeared evenly and only moderately intensely stained. The leucocytes stood out clearly and the bacteria adsorbed the blue dye in varying degrees. The tendency to overstaining did not manifest itself, and it seemed that such a dye solution presented a promising basis for the development of a staining process which would make visible and countable a maximal number of bacteria and other cells present in the milk.

The procedure consists of the following simple steps: The milk films were prepared and dried *thoroughly*. Films were next defatted as usual. Again, after *thorough* drying, films were submerged into an alcoholic solution of 0.6 per cent of methylene blue for one minute. They were then lightly rinsed

in tap water, *thoroughly* air-dried, and examined under the microscope. Comparative counts indicated that such a staining procedure yielded counts considerably higher than any of the staining procedures previously investigated.

To meet the need for a single-dip process, we tried to mix the alcohol with equal volumes of different well known defatting agents, such as xylene, ethyl ether, chloroform, and tetrachlorethane. We found xylene unsuitable because of its tendency to precipitate, to some extent, the methylene blue dye. Ether was given serious consideration because its low surface tension of 17.0 dynes per cm. at 20° C. was regarded by us as a desirable physico-chemical property. However, because of its high combustibility and rapid evaporation, it was soon eliminated. Chloroform was eliminated because its surface tension of 27.1 dynes per cm. at 20° C. is higher than that of alcohol, and also because of the rapidity with which it evaporates from its mixture with alcohol, constantly changing both the defatting properties of the original solution and the dye concentration. Tetrachlorethane, as we observed it, volatilizes from its alcohol solution at about the same rate as does the alcohol. It has a decidedly objectionable odor and is considered toxic if its concentration in the air is considerable and exposure to its vapors is prolonged. However, when the staining solution is used in its prepared form in a laboratory properly ventilated, and care is taken to keep the staining jars covered, the objections enumerated can be safely disregarded. Our further experiments, therefore, were limited to the study of a solution of the methylene blue dye in a 50-50 per cent mixture of 95 per cent ethyl alcohol and tetrachlorethane.

After many trials the following formula was adopted as the most suitable for further comparative studies:

EXAMINATION OF MILK

Vol. 38

Certified methylene blue powder.. 0.6 gm.
 Ethyl alcohol, 95%..... 50.0 ml.
 Tetrachlorethane, technical..... 50.0 ml.

This dye solution was shaken vigorously for 5 minutes, then allowed to stand overnight to enable the dye to go into complete solution. The solution was then again vigorously shaken for 5 minutes and filtered through high grade quantitative filter paper. The milk films were then immersed in this staining solution for 1 minute, gently rinsed in tap water and allowed to dry in the air thoroughly. Overstaining did not occur, even if the slides were left in the staining jar for a longer time. In fact, if the slides were left in the solution too long, the films began to lose some of their stain. This should not be allowed to happen, as the procedure of "doctoring" stained films, in our experience, never gave satisfactory results, no matter what staining procedure was applied. A certain amount of reddish iridescence appeared around the lighter stained bacteria upon continuous refocusing of the objective. The addition of 2.5 ml. of C. P. glycerol to 100 ml. of the staining solution eliminated this difficulty.

After this stain had been extensively tested and found capable of producing favorable results, a search of the literature disclosed that a similar type of staining formula was suggested for milk films by Erb, in 1929.⁴ Erb's formula is as follows:

Ether, sulfuric..... 50.0 ml.
 Alcohol, ethyl, absolute..... 50.0 ml.
 Methylene blue..... 0.59 gm.

It may be that if Erb's paper had been published in a journal more widely read by those engaged in milk work, his formula might have been better known. Our objection to the use of ether as the defatting agent has been stated before. The requisite of "Absolute" alcohol in work where 5 per cent of water would be absorbed in a very

short time, appeared to us more as a formality, as did the weighing out of 0.59 gm. of the dye instead of 0.6 gm. For these reasons we did not investigate staining by the formula of Erb.

COMPARATIVE COUNTS OF FILMS STAINED
 WITH CARBOLATED METHYLENE BLUE,
 THE NEWMAN-LAMPERT AND THE
 WATER AND ACID-FREE METHY-
 LENE BLUE STAINING SOLUTIONS

The technic employed in the preparation of the milk films was as follows: Good quality, non-corrosive microscopic slides were used. Triplicate 1 cm. squares were delineated on the slides by means of a diamond point and a specially prepared celluloid or metal gadget developed by one of us.⁵ After the samples were adequately shaken, the milk was measured with 0.01 ml. standardized pipettes. Bent needles were used as spreaders. Care was exercised not to allow the milk to spread outside the scratched delineations. The films were then dried on a covered drying plate, thermostatically controlled, at a temperature of 54° C.

In the 8th edition of *Standard Methods for the Examination of Dairy Products* no definite requisite is described for the selection of microscopic fields representative of the 1 cm. square area. Levowitz⁶ suggested the strip area procedure. Hanks and James⁷ suggested that microsampling be done along two median lines at right angles. With occasional exceptions, we followed the latter procedure. The number of fields counted were those stipulated in the 8th edition of *Standard Methods*.

Two sets of counts were made. In the first set, duplicate films, as previously described, were made of each of ten raw milk samples, stained by the Carbolated Methylene Blue and the water and acid-free procedure studied by us, and counted for the number of bacteria and leucocytes. The results are shown in Table 1. In the

second set triplicate films were made of each of 13 raw milk samples, stained by the Carbolated Methylene Blue, the Newman-Lampert, and the authors' proposed procedures. The results are presented in Table 2.

The data presented in Table 1 indicate that the critical analysis of the difficulties inherent in the Standard Methylene Blue and in the Newman-Lampert stains previously discussed by us¹ appears to be essentially correct, and that the principles upon which the stain proposed by us is based are in accord with the varied affinities for the

blue dye possessed by bacteria of different species and most probably of different ages. The average bacterial count by the water and acid-free stain was 122 per cent greater than the average count by the Carbolated Methylene Blue stain. The leucocyte count showed an average of 15 per cent lower than by the Carbolated Methylene Blue. This reduction in the leucocyte counts by the new stain does not occur as a constant phenomenon, as is shown by the data appearing in Table 2. The data presented in Table 2 again show that remarkably close counts can be

made on duplicate films of raw milk stained by the Carbolated Methylene Blue and the Newman-Lampert techniques. This appears to apply equally to counts of bacteria and leucocytes. The leucocyte counts obtained from milk films stained by the authors' procedure were 15 per cent lower in one set and 8 per cent higher in the other, averaging only 9 per cent below either of the other two stains. The bacterial counts were 122 per cent higher in the first set and 66 per cent higher in the second set, with an average increase of approximately 94 per cent.

In another comparative study of a limited number of stained films, an average increase as high as 700 per cent was obtained for milks containing below 200,000 clumps by the carbolated methylene blue, and an increase of 100 per cent for milks containing over 1,000,000 bacterial clumps by the carbolated methylene blue. Inasmuch as the procedure outlined by us is basically simple and employs reagents easily obtained and well known to laboratory workers, it is believed that it merits serious consideration and further study on a broader basis of application.

The films appear under the microscope sufficiently stained, and the morphology of bacteria and other cells is clear-cut and unmistakable. The stained background shuts off enough of the light to lessen eye fatigue. The leucocytes appear the darkest. The bacteria stain in various degrees of intensity, and are distinguishable at all depths of the milk film, including the bacteria fixed immediately upon the surface of the slide. With this stain, therefore, probably more than with other stains, continuous refocusing of the objective is of utmost importance.

A POLYCHROME METHYLENE BLUE STAIN

At the time the material above reported was being typed in its final form for publication, a manuscript of a

paper by Anderson, Moehring, and Gunderson,⁸ describing the preparation and application of a polychrome methylene blue stain was received. From the viewpoint of adsorption this staining solution presents a complex heterogeneous system, since it contains sulfuric acid, potassium dichromate, disodium acid phosphate, methylene blue hydrochloride, a number of different and possibly variable polychrome methylene blues, plus some unknown intermediate chemical compounds resulting from the process of the polychrome production described. The discussion of the interplay of forces comprising such a system of adsorption would necessitate extensive experimentation and would lead into lengthy considerations. We were not prepared at the moment to devote time to such analysis, and limited our investigation of this staining solution to a study of bacterial counts obtained by this compared with other stains.

In the manuscript the authors stated that better results were secured when a 50-50 per cent mixture of ethyl alcohol and chloroform was used for defatting and fixing of milk films. The value of such a mixture was discussed by us earlier in this report and will be discussed in a later paragraph. The ingredients used in the preparation of the polychrome solution as given in the manuscript of Anderson, Moehring and Gunderson were as follows:

| | |
|---------------------------|-----------|
| Methylene blue..... | 0.5 gm. |
| Potassium dichromate..... | 0.5 gm. |
| Sulfuric acid (1%)..... | 3.0 ml. |
| Water | 500.0 ml. |

We received from Anderson and Gunderson a quantity of this unbuffered staining solution prepared by them and used it in the comparative tests.

Triplicate sets of films of ten raw milk samples were prepared, stained by each of the procedures, and counted. The results are summarized in Table 3. Defatting and fixing with alcohol-

chloroform produced a semi-translucent evenly fixed film. With the unbuffered solution, occasional peeling in spots occurred, but not frequently nor extensively enough to cause any difficulty. However, as previously stated, chloroform is rapidly evaporated from its mixture with alcohol and in a short time its concentration is diminished, reducing the defatting properties of the mixture. To anyone who prefers the use of chloroform as a milk film defattant, it might be recommended that it be used in a separate step, followed by fixing in alcohol alone. By the time the milk film is transferred from the chloroform-containing to the alcohol-containing jar, the chloroform completely evaporates, and no time is lost, and the defatting is more complete. The haziness of the film previously mentioned is not eliminated thereby.

The staining solution, commonly referred to as a "polychrome methylene blue," was first recommended by Singh, Jaswant, and Brattacher in 1944 for staining malarial parasites.⁹ Apparently their method of preparing the dye produced incompletely satisfactory results. Manwell in 1945 described a modification of the original method intended primarily for staining malarial parasites.¹⁰ He referred to it as the J.S.B. staining solution. Later Man-

well and Feigelson¹¹ further modified the procedure. In their last revised manuscript, Anderson, Moehring, and Gunderson¹² give the following ingredients to be used in the preparation of the polychrome methylene blue staining solution:

| | |
|-------------------------------------|-----------|
| Methylene blue..... | 0.5 gm. |
| Potassium dichromate, C.P. 5% | 10.0 ml. |
| Sulfuric acid, C.P. 1%..... | 3.0 ml. |
| Disodium hydrogen phosphate | 1.0 gm. |
| Distilled water..... | 990.0 ml. |

Steps for the preparation of the staining solution are outlined in a mimeographed leaflet issued by the Rockford, Ill., Health Department October 7, 1947. We were rather surprised to find that the authors added disodium hydrogen phosphate to their formula, since in one of their personal communications¹³ Anderson and Gunderson stated: "We have found that buffer salts in the stain cause the film to wrinkle more or less around the edges," and in another personal communication¹⁴ they wrote: "We find they [phosphate salts] cause a marked distortion of the film." Anderson and Gunderson sent us some of the staining solution prepared as described in their mimeographed outline. We tested it on films of raw and pasteurized milk and experienced considerable difficulty with

extensive wrinkling and oftentimes complete washing off of the milk films. It appears reasonable to suppose, therefore, that further modifications may be proposed. At present the dye cannot be purchased commercially as a certified product, hence laboratories wishing to use it must go through the complex process of preparing it. Experience alone can indicate whether or not the procedure for the dye preparation described in the mimeographed outline will consistently produce identical results in various laboratories.

In malarial parasites the J.S.B. polychrome staining solution produces differential polychromic staining. In raw milk smears no polychrome effects are discernible. The milk proteins of the background of the films and the bacteria as well as any adventitious matter thus far observed all stain a bluish somewhat muddy violet. The differential effects are produced by differences in the amount of dye adsorbed by the background proteins, the leucocytes and the bacteria. The milk proteins stain the lightest, the leucocytes the heaviest, and the bacteria in varying degrees in between. The milk film appears evenly stained and no heavy cloud-roll effects, commonly encountered with the carbolated methylene blue staining solution, have been observed. The stained film appears slightly foggy but this does not seem to interfere with the recognition of bacteria. The background, as in the staining procedure discussed just previously, stains intensely enough to shut out excess light, and fatiguing of the eye is considerably lessened. As in slides stained by our water- and acid-free procedure, we found no need for the use of light filters. However, considerable difficulty was experienced when continuous refocusing of the objective was resorted to. The refocusing range with this type of polychrome methylene blue stain is confined to an extremely narrow range, beyond which

the bacteria and some of the leucocytes manifest a reddish iridescence which obscures their morphology.

The average increase in bacterial counts of two groups of five films stained with carbolated methylene blue, as shown in Table 3, was 490 per cent for a group of five films counting 200,000 clumps or less by the carbolated methylene blue, and 52 per cent for the group of five films of 1,000,000 clumps or over. Corresponding increases with the water- and acid-free stain proposed by us were 660 per cent and 92 per cent. Since the latter counts were greater than those yielded by the polychrome methylene blue, they must be considered as the present maximal counts. These increases in counts, in the light of experience accumulated through years of study of the direct microscopic count methods, may appear incredible and confusing. However, if corroborated in future studies, the results would call for an extensive discussion and reconsideration of certain heretofore established notions and practices now prevailing in bacteriological milk analysis.

SUMMARY

1. A theoretical discussion is presented of certain principles of adsorption as they apply to the study of staining procedures for the direct microscopic examination of milk.
2. In concordance with such principles a two-dip staining solution consisting of 0.6 per cent methylene blue dye dissolved in 95 per cent ethyl alcohol and a single-dip staining solution consisting of alcohol, tetrachlorethane and methylene blue hydrochloride have been developed, free from added water and acid.
3. The results presented indicate that such staining solutions are capable of yielding present maximal bacterial counts in milk.
4. A polychrome methylene blue solution similarly yielded materially higher counts than carbolated methylene blue.

"It is scarcely necessary to acknowledge our vast indebtedness to science in giving us the methods and patterns of research in human relationships. Every contribution of science to the problems of society is to be welcomed. But the enlightenment of science is bringing with it a tendency to reject the limitations of science. To expect that exact measurement and exhaustive definition will relieve us of the necessity of ethical inquiry, or that the meaning and values of human life will somehow or other crystallize as physics crystallized around the concepts of mass

and energy, is a form of superstition as deadly as any we have known.

"The issues of our time and of human destiny will be determined, not at the physical, but at the ethical and social level. Material power and dollars and military ascendancy may preserve us temporarily; but the dynamic tensions of our society can be relieved only by moral and social wisdom, and that kind of wisdom cannot be precipitated in a test tube nor can it be won by the brilliant processes of nuclear physics."—Raymond B. Fosdick, *Rockefeller Foundation—A Review for 1947*.

Bacteriological and Epidemiological Data on Typhoid Fever in Amsterdam

A. CHARLOTTE RUYS, M.D.

*Head of the Municipal Public Health Laboratories, Professor at the University
Amsterdam, Holland*

SHORTLY after World War I typhoid fever was one of the major problems in Amsterdam.* Epidemiological analysis showed that milk was one of the main sources of the infection. Many farms in the neighborhood of Amsterdam, which provided the city with milk, lay in a district where typhoid was prevalent and sanitation was poor. An attempt to combat the spread of the disease was made by the public health authorities in the following ways: An intensive search for carriers and a strict survey at the farms were instituted, carriers were forbidden to handle milk, the sale of raw milk from farms or houses with cases of typhoid was legally prohibited, the water supply at the farms was improved, and the public was educated not to use raw milk. These measures were followed by a rapid decrease in the number of typhoid cases and for many years after 1930 milk was seldom the source of typhoid in Amsterdam. There still remained each year several cases of unknown origin. Figure 1 gives the number of typhoid cases divided into groups according to the source of the infection. Figure 2 gives the number of carriers known to the public health authorities in Amsterdam and the number of carriers detected each year.⁴

The bacteriological examinations were made in the Municipal Public Health Laboratories. In earlier days only

Endo's medium was used; in 1927 it was combined with the tetrathionate enrichment broth of L. Muller. Kauffmann's enrichment medium did not appreciably improve the results, but when in 1936 the medium of Wilson and Blair was added, the number of positive findings increased very much. In an article in 1940¹ I could demonstrate that in one series the number of positive results rose from 165 to 222 by the use of Wilson and Blair's medium.

However, the greatest progress made was in the field of the examination of surface water. Before this, we never succeeded in tracing with certainty the source of typhoid infections to water. By means of Wilson and Blair's medium, we could demonstrate in several small epidemics and isolated cases in the surroundings of Amsterdam that contaminated water was the source of the infection. In the small fishing town of Volendam we isolated on 13 different dates typhoid bacilli from various parts of the canals.² In another village, we isolated typhoid bacilli from the ice covering a frozen canal, where three weeks previously a child had infected herself by sucking a piece of ice.³ However, in the city of Amsterdam surface water does not play an important part in the spread of the disease.

In the first years of the war typhoid did not increase very much; until September, 1944, the situation remained reasonable. The number of cases was fairly low, although the search for carriers yielded each year a few hitherto

* Amsterdam is a city with approximately 800,000 inhabitants. It is a large seaport with much traffic.

unknown ones. While the number of patients decreased the number of known carriers increased, as is shown in Figures 1 and 2. Some carriers were removed from the list as they became negative following the extirpation of the gall bladder, others moved to another residence and some died.

The total number of patients considered to be infected in Amsterdam during the last 20 years is given in Table 1.

In the hunger winter (1944-1945) there was a total collapse of preventive measures. All traffic became extremely dangerous, so that control at the farms and food control in the surroundings of Amsterdam was almost impossible. There was no longer any gas, electricity, or fuel to heat the food sufficiently.

In December, 1944, a severe typhoid

epidemic broke out, which could be traced to the consumption of contaminated smoked eels. The fish had been kept alive for several days in the water of the harbor of the small fishing town. There they were contaminated by the sewage which flowed into the harbor. They could not be smoked immediately for lack of wood. Finally they were smoked, but insufficiently. The eel

FIGURE 1

FIGURE 2

meat was officially discarded, but it found its way into the black market and the starving people were ready to eat even spoiled food. From this source 141 patients acquired typhoid and caused another 21 contact cases.⁴

After the liberation in 1945, thousands of prisoners and workmen came home from Germany, many of them in the incubation period of typhoid. Also people returned from various parts of the country where typhoid was prevalent. Many cases were not diagnosed immediately because the patients did not call a doctor for fear of being taken to a hospital after having returned to their homes so recently. Several members of their families were contaminated. There were 197 cases infected outside Amsterdam which are not registered in Figure 1 and Table 1.

In the summer of 1945 another epidemic broke out caused by milk which

had been contaminated in a large plant after pasteurization and before distribution. There were no bottles; there still was no gas, electricity, or fuel to heat the milk, which to a large extent was drunk in raw condition. We found a carrier working at the plant. The number of victims was 175. The absolute lack of soap, textile, toilet paper, hot water, and disinfectants favored the spread of the disease, and a high number of 282 contact cases was noted. Despite the absence of gas and electricity the laboratory kept working and the diagnosis was confirmed in all cases, bacteriologically or serologically.

At the end of the year the situation was in hand again but we were left with a large number of new carriers. The known ones are given in Figure 2, but we are sure there have been many more still unrecognized.

Soon after the liberation, the labo-

ratory received from friends in the United States and from Dutch friends abroad supplies of the various new media for the diagnosis of enteric infections.

We first compared the results of stool specimens on Endo, Leifson's desoxycholate-citrate (D.C.),⁵ Wilson and Blair's, and the selenite enrichment medium of Leifson,⁶ with the following results:

| <i>Positive by means of:</i> | | <i>Exclusively Positive</i> | |
|------------------------------|----|-----------------------------|----|
| Endo | 20 | Endo | 0 |
| Desoxycholate-citrate... | 52 | D C | 6 |
| Wilson-Blair | 48 | Wilson-Blair | 8 |
| Selenite | 66 | Selenite | 19 |
| Total | 82 | | |

These figures show that it is not wise to rely on one or two media. Even the most selective ones sometimes fail to demonstrate the pathogens. In these series the selenite medium was exceptionally good.* A new sample of the same chemical from the same factory, however, was less satisfactory, and several samples from other factories never reached the standard of the first.

In another series we replaced the Endo by the S.S. plate of Difco. In this series the selenite medium fell below the D.C. plate. The S.S. medium gave approximately the same percentage of positive results as Wilson and Blair's.

Again we find that the larger the series of highly selective media, the larger the number of positive specimens.

| <i>Positive by means of</i> | | <i>Exclusively Positive on</i> | |
|-----------------------------|----|--------------------------------|---|
| S.S. | 56 | | 2 |
| D C. | 70 | | 3 |
| Wilson-Blair | 57 | | 3 |
| Selenite . | 67 | | 3 |
| Total | 94 | | |

Since the introduction of these highly selective media in the routine examination of stools we have found some positive results in healthy people who could not be considered as chronic carriers. We did not find them among food handlers and other people from

healthy surroundings. They had always had a recent contact with typhoid cases but had not suffered from a disease resembling typhoid. By means of Wilson and Blair's medium alone we isolated typhoid bacilli from the stools of 2 contacts, who had not suffered from the disease and did not fall ill. In the following examinations they were negative and remained so on subsequent tests. Quite a number of unexpected positive cases were found in a survey with all our new media in September, 1946.⁷ In one of the large hotels a wedding party was infected with typhoid; in the course of 2 weeks 14 of the 17 guests fell ill. The stools of the whole staff of the hotel, 217 men and women, were examined and 2 were found to be suffering from typhoid. Five of the kitchen staff were excreting typhoid bacilli without being ill. None of them had suffered from the disease. Typhoid H suspensions were not agglutinated by their sera, typhoid O agglutination was positive 1:50 or negative. They showed a negative Vi-agglutination. Four of them were found positive only by means of the excellent sample of the selenite medium. All had been vaccinated against typhoid a year before. Several control examinations afterward were always negative. Four were reexamined 16 months later with negative results, but we were unable to make a culture from the duodenal gall.

Two guests of the wedding party who were not ill yielded positive stool cultures 4 weeks later. One of them suffered a light attack of typhoid 35 days after the infecting meal; she had been vaccinated a year before. The other gave negative stool cultures in two consecutive examinations, and then suffered a light attack of typhoid 3 weeks later, which was 2½ months after the wedding party. The source of the infection was found afterward to be outside the hotel. An epidemiological analysis of some

* We used mannitol instead of lactose following an English prescription.

other cases of typhoid pointed to a herring handler. In his home we found the stepmother to be a chronic carrier. She was ill and had moved into the home of the herring handler some weeks previously. Her daughter, who nursed her, probably infected a batch of salt herrings and the infection spread in the herrings during the 24 hours process of desalting. In a series of experiments I could demonstrate by means of the selenite medium that in this way salt herrings may become an excellent source of infection. All the patients and temporary carriers had eaten herrings from this handler, and the hotel received the herrings from his shop.

The five cooks resumed their work and no more cases occurred. The Vi-phage typing performed by Dr. Scholtens in the State Laboratories at Utrecht showed that the patients, the stepmother, and the temporary carriers all were infected with the same type (E₁).

On a large ship, where during two subsequent voyages several typhoid cases had been observed, the whole crew was examined. Two of the kitchen staff (Goanese people) and a Chinese carpenter yielded positive cultures. In none of them was there a history of typhoid or any serious illness. Repeated Vi-phage typing by Dr. Scholtens showed that the kitchen workers harbored different strains of Type A, one the ordinary type, the other, a maltose non-fermenting strain. Both proved to be chronic carriers, one with a positive Vi agglutination 1:20, the carrier of the variant strains with a negative Vi agglutination. However, the patients and the Chinese carpenter all were infected with a phage Type D₆ strain. The carpenter, who had been immunized some time before, agglutinated typhoid H suspension 1:250, typhoid O suspension 1:100, typhoid Vi negative. His stools were twice found positive but he did not fall ill. Two weeks later his stools were negative and remained so

on 4 subsequent tests, and again half a year and a year later. The last observation showed negative seroreactions and a negative gall culture. He remained on the ship and no more cases occurred. Most probably he was a temporary carrier and the source of the infection remained unknown.

DISCUSSION

The observations related above very strongly suggest that the finding of typhoid bacilli in contacts of typhoid cases may be an indication of a temporary infection of the intestinal tract which need not be followed by clinical symptoms of disease. In paratyphoid B, temporary infections in contacts without any clinical symptoms are even more frequent. When examining the contacts of 77 patients we found *Salmonella schottmülleri* in the stools of 16 people who did not develop the disease. All were found positive several times but lost their infection after a few weeks to several months. None remained a chronic carrier.

The question arises whether typhoid and paratyphoid bacilli may be less pathogenic than is generally assumed. This suggestion is supported by other epidemiological findings.

Known chronic carriers of typhoid and paratyphoid bacilli generally do not cause any more new cases after they have been recognized as carriers. Only very unhygienic people with dirty habits remain a constant source of danger. As a rule simple preventive measures are enough to protect the families. However, from the rapid and easy spread of dysentery in a family we know how large fecal contact may be, even in "hygienic families."

The repeated finding of enormous numbers of typhoid bacilli in some Dutch canals, the water of which is used extensively for traffic and household purposes, also suggests a rather low pathogenicity. The same is true

for the water in Batavia.⁸ Typhoid is present in these communities, but not on such a scale as one would expect from the intensive contact with the heavily polluted surface water.

SUMMARY AND CONCLUSION

For the isolation of typhoid bacilli a series of highly selective media should be used, for instance, selenite enrichment fluid and the Wilson-Blair, S.S., desoxycholate-citrate media and others. By means of these highly selective media several temporary carriers of typhoid bacilli were found.

During and after the war three large

epidemics of typhoid were observed; one caused by smoked eels, one by salt herrings, and another by milk contaminated by a chronic carrier in a dairy plant.

A New and Rapid Method for the Preparation and Standardization of *Brucella* Ring Test Antigen

RONALD M. WOOD

*Department of Bacteriology, The Johns Hopkins University School of Medicine,
and the Wilmer Ophthalmological Institute of The Johns Hopkins
Hospital and University, Baltimore, Md.*

THE titration of *Brucella* agglutinins in milk is of accepted diagnostic significance and is extensively employed by Cooledge,¹ Gilman,² Henry, Haring, and Traum.³

The agglutination is usually performed by either the slow tube method or the rapid plate method on whey obtained by treating the milk with rennet. In an attempt to avoid false-positive reactions caused by particles of casein or fat, use has been made of stained antigen with good results, Hermann.⁴ The author has found that the temperature at which clot retraction is allowed to occur in the preparation of whey has a marked effect on the titer subsequently obtained; thus, samples treated at 4° C. have occasionally been found which gave a titer of 4 times higher than the same sample treated at 56° C.

It is known that, in infected milk, *Brucella* organisms concentrate in the cream layer where they are as much as 50 to 100 times more numerous than in the underlying milk. If intensely stained antigen is added to milk having agglutinins, the concentration of the antigen in the cream layer will give a distinctive color to the cream. The same antigen added to a milk sample free of agglutinins will remain distributed throughout the milk leaving the cream layer uncolored. This

phenomenon is the basis of the Ring Test (known abroad as the Abortus-Bang-Ringprobe) discussed by Hermann⁵ and further studied by Darnell.⁶ The test for the presence of *Brucella* agglutinins based on this phenomenon is simpler and quicker to perform.

PREPARATION OF ANTIGEN

Previously described methods involve growing the organisms on agar for 3 or 4 days. This is objectionable because of the relatively small yield of antigen obtained, the time required, and the presence of both dissolved agar and particles of agar which oversensitize the antigen. I have modified the method as follows:

Since the Ring Test requires a larger quantity of bacterial cells than the slow tube agglutination method, massive growth of a smooth strain of *Brucella abortus* is obtained in 24 to 48 hours by the method described by Brown and Wood,⁸ using broth as a medium.

Pancreatic digest of beef heart, Brown,⁹ or Trypticase· Soy Broth (B.B.L.) have been found satisfactory. A typical yield has been 10 ml. of finished antigen from 100 ml. of broth.

The growth is harvested in a flask and sufficient 1 per cent phenol in 0.85 per cent sodium chloride solution is added to give a final concentration of

0.5 per cent phenol. After standing for 24 hours at 20° C., the phenolized antigen is distributed in well stoppered centrifuged bottles and immersed in the water bath at 60° C. for one hour. The bottles are chilled rapidly in cold running tap water and then centrifuged at 3,500 r.p.m. until sedimented. The supernatant is discarded and the cells are resuspended in distilled water and filtered through glass wool to remove any gross particles that may be present. After 2 more washings in distilled water, the volume of the sedimented cells is noted, then they are resuspended in 2 volumes of distilled water preparatory to staining.

STAINING METHOD

A well "ripened" solution of Delafield's Hematoxylin is employed, Kolmer and Boerner.⁷ Immediately before use, it is filtered and diluted 1:5 with distilled water. To the volume of packed cells previously noted, 25 volumes of stain are added with thorough mixing. After staining for 6 hours at 20° C., the bacteria are centrifuged down and repeatedly washed with distilled water until the supernatant remains colorless. Three washings are usually sufficient. After the final washing, the sedimented bacteria are resuspended in 6 volumes of 0.85 per cent sodium chloride solution containing 0.5 per cent phenol, preparatory to standardization.

STANDARDIZATION OF ANTIGEN

Using phenolized sodium chloride as a diluent, samples of antigen are set up in 5 tubes as follows: Undiluted, 1:2, 1:3, 1:4, 1:5.

Two rows of Wassermann tubes are set up in a rack. In one row, one ml. of known positive milk is added to each tube. In the other row, one ml. of a known negative milk is added to each tube. One drop of each dilution of antigen is added to a corresponding pair of a positive and a negative tube

of milk. The tubes are gently shaken to mix the antigen thoroughly and the rack is placed in a water bath at 37° C. for 30 minutes.

The optimum dilution of antigen is that which shows a distinct purple color throughout the cream layer of the positive sample with practically no color in the underlying milk. The same dilution of antigen in the known negative sample should show little or no color in the cream layer with an evenly distributed blue color in the underlying milk. If a known negative sample shows more color in the cream layer than in the underlying milk, the antigen is unsatisfactory and should be discarded.

The antigen is next checked for sensitivity. The whey titer of a positive milk sample is accurately determined by the slow tube method. The positive whole milk is then serially diluted with negative whole milk to beyond the end point determined by the whey titration, in such manner that the final volume in each tube is one ml. One drop of previously chosen optimum dilution of antigen is added to each tube with gentle shaking and incubated for 30 minutes at 37° C. in the water bath. The antigen is satisfactory if the last tube showing a positive ring corresponds to the same dilution in the whey titration at which the end point was found.

USES AND SENSITIVITY

Hematoxylin stained *Brucella* antigen may be substituted for the unstained antigen generally used in both the slow tube and rapid plate method of serum agglutinations. For these methods the antigen must be appropriately standardized by dilution so that known positive samples run in parallel; using stained and unstained antigen, give the same end point. Stained antigen in these tests gives a more easily read end point.

The Ring Test may be used for

skimmed milk or homogenized milk by adding 2 or 3 drops of negative cream to each ml. of milk. Tests on serum or whole citrated blood to which negative cream has been added have given encouraging results not only with *Brucella* antigen but also with others.

The antigen prepared as described above has been used in parallel with the standard whey agglutination test on a large number of milk samples. In no case was a positive obtained by the whey titration which was not also positive by the Ring Test. This is in agreement with the findings of previous authors using antigen prepared by other methods. The Ring Test method has been found by the author to be a reliable and rapid method, having fewer sources of error than the whey titration method, even when used as a qualitative rather than quantitative test.

SUMMARY

A method for the rapid production of large quantities of *Brucella* antigen with the complete absence of both agar particles and dissolved agar is described.

The antigen is satisfactory for use in the usual methods of testing as well as for the Ring Test.

The Ring Test has been found as sensitive as whey titration for detecting *Brucella* agglutinins in milk.

Effectiveness of Compound G-11 in Reducing Pyogenic Skin Infections

JOHN R. FULLER, M.D., CHESTER A. NEWHALL, M.D.,
FREDERICK C. THORNE, M.D., AND EUGENE F.
TRAUB, M.D.*

Burlington, Vt., and New York, N. Y.

PREVIOUS investigations¹ had shown that the chemical compound 2,2'-dihydroxy-3, 5, 6-3'5', 6'-hexachlorodiphenyl-methane² (hereinafter termed G-11) when incorporated in a toilet soap to the amount of 2 per cent † and used daily in ordinary routine cleansing of the skin made it possible to reach and maintain an exceedingly low bacterial population on the skin of the hands and forearms. Seastone,³ working with the same compound, made observations on the use of G-11 in the surgical scrub. Also, Traub, Newhall, and Fuller have shown⁴ that 2 per cent G-11 soap produces a truly bactericidal rather than bacteriostatic action and does not form a film on the skin under which viable bacteria are retained in large numbers. The 2 per cent G-11 soap reduced both pathogenic and non-pathogenic organisms found on the human skin, and compound G-11 was found to be non-irritating to the skin as judged by more than 400 repeated patch tests. It was believed that exclusive use of soap containing compound G-11 should reduce the probability of infection following abrasions and superficial wounds of the skin, and it was suggested that the use of this soap would protect against cutaneous

infections such as hair follicle infections, etc.

METHODS

In a desire to put to practical use 2 per cent G-11 soap in reducing the incidence of skin infections on a large heterogeneous population, we selected as an experimental group the entire population of the Brandon State School, an institution caring for mental defectives ranging in chronological age from 6 months to over 50 years. During the 2 year period covered by the study, the resident population averaged 389 persons including 179 males and 210 females; most of these persons were resident continuously at the institution and therefore under constant medical supervision. The subjects represented a typical sample of idiots, imbeciles, and morons of all ages and clinical types.

It is believed that an institutional group of this type constitutes an ideal population for such an experiment because of the notoriously high incidence of pyogenic infections of the skin among mental defectives who live in a grossly contaminated dirty environment and possess insufficient intelligence to apply even the most rudimentary rules of cleanliness. This type of population is also desirable because their conditions of living may be rigidly controlled over long periods of time.

* With the technical assistance of Winston E. Cochran, B S.

† The soap used in these experiments were supplied by Givandan-Delawanna, Inc., New York.

Plan of Experiment—The basic plan of the experiment was to compare the incidence of all types of superficial and deep pyogenic infections of the skin during a control period extending from June 1, 1945, to May 31, 1946, in which no special medications or precautions were employed, with the results of a comparable 12 month period extending from June 1, 1946, to May 31, 1947, during which the entire situation was held constant except for the introduction of G-11 soap as the variable experimental factor. It so happened that comprehensive data concerning the incidence of skin infections during the control period had been collected as part of another experiment. The only change in the institutional procedure during the period of this study was the substitution of G-11 soap in the same quantities as had formerly been requisitioned of ordinary toilet soap. In order to avoid suggestion effects, increased incidence of washings or other artifacts, it was decided to keep the fact that an experiment was being conducted secret from both employees and inmates. Only the medical staff and the head nurse who made daily inspections of the population knew of the experiment. The remainder of the staff and the inmates accepted the G-11 soap without question and used it in the same manner as was common routine with ordinary soap.

Recording of Data — During the period of the experiment, the Brandon State School was subjected to a careful medical inspection to determine the incidence of skin infections of all types. The head nurse made daily rounds of the entire institution, routinely inquiring for cases needing treatment. All cases were subsequently observed by one of the medical staff for evaluation and treatment. A daily record of type, location, duration, and treatment of all skin infections was kept. For the purposes of this experiment, skin

infections were classified in the following groups:

1. *Carbuncles*—Acute pyogenic inflammations of the skin and subcutaneous tissues characterized by multiple foci of necrosis and sloughing of the superimposed integument.
2. *Large furuncles*—Acute circumscribed inflammation of a sebaceous gland or hair follicle, usually more than 2 cm. in diameter.
3. *Small furuncles*—Furuncles less than 2 cm. in diameter, and including pustules, pimples, and impetigo contagiosa.
4. *Styes*—Circumscribed infections of hair follicles of eyelid.
5. *Cellulitis*—Including paronychias, and felons.

Treatments — Routine methods of treatment were carried out by the same medical personnel during the 2 year period. Self-limited infections were treated with local applications of ammoniated mercury, sulfathiazole ointment, or ichthyol. Surgical incision was used only with cases presenting definite fluctuation. No special medications except the G-11 soap were introduced during the experimental period.

Bacteriological Controls—In order to provide an objective check of the *in vitro* germicidal effects of G-11 soap in this experimental group, control hand washing experiments according to the technique previously reported¹ were performed on a group of ten subjects. These subjects were chosen from the entire population because they had had the highest incidences of skin infections during the 12 month control period. It was felt that these subjects probably had the highest concentrations of virulent microbial flora because of repeated pyogenic infections during the previous year. The hand washing experiments with bacteriologic colony counts were performed at intervals of from 2 to 3 months during the experimental period.

The general method of hand washings and collection of samples as used in our previous investigations on G-11 soap was used except for the use of three instead of ten basins.

Ordinary tap water having a bacterial

large and small furuncles. During the control year (1945) there occurred 96 furuncles of all types, while during the experimental period the incidence was decreased to 72, or 25 per cent less. An alternative explanation is that the criteria of classification may have changed in the direction of minimizing the magnitude of the infection. In our opinion, this possibility may be discredited by the fact that during the experimental period there was extreme vigilance utilized in detecting and classifying lesions. In questionable cases, the diagnosis was confirmed by the school physician in addition to the medical director of the Brandon State School.

Particularly convincing in regard to the action of G-11 soap was the decrease in incidence of cellulitis from 81 cases in 1945 to 30 in the experimental period, or a decrease of 63 per cent. It is a long established fact that the severity of pyogenic skin infections in mentally defective populations is much higher than in the general population because of lowered systemic resistance, highly contaminated environment, and poor habits of personal hygiene. The data concerning styes indicated a slight increase during the experimental period; but this finding is not considered significant because there was no reason to suppose that G-11 applied to the skin would exert any effect on the conjunctival sac.

During the period of the experiment, none of the 389 subjects demonstrated any evidence of chemical irritation or sensitivity to the use of G-11 soap.

DISCUSSION

The results of this experiment are considered to be very significant due to the fact that medical opinion has generally regarded it as impossible to decrease the bacterial flora of the skin over long periods of time with chemical agents. The carefully regulated conditions of this experiment, in which the

only variable factor was the introduction of G-11 soap demonstrate that it is possible to control the high incidence of skin infections found in institutional populations. It seems important to emphasize that neither the staff nor the inmates of the institution knew that an experiment was being conducted, and that there was no change in the routine of personal hygiene. If anything, the observations during the experimental period were conducted more rigorously than during the control period because of the desire to lean over backward in assuring the validity of the results.

The results confirm that the incidence of pyogenic skin infections is closely related primarily to personal cleanliness rather than to systemic factors. The fact that the bacterial flora of the skin may be so conveniently decreased by the sole addition of G-11 soap with no other change in personal hygiene indicates that great improvements may be made in normal and institutional populations in the prevention of pyogenic skin infections.

SUMMARY AND CONCLUSIONS

An experiment has been performed for the purpose of observing the effect of continuing use of soap containing compound G-11 in reducing the bacterial flora of the skin and decreasing the incidence of pyogenic skin infections. The subjects of the experiment were 389 mentally defective inmates of the Brandon State School on whom detailed records concerning the incidence of skin infections were available for a control period of one year. During the experimental period, the only change in normal institutional routine was the substitution of G-11 soap for ordinary toilet soap previously used. Clinical results indicated a significant decrease in the number and severity of carbuncles, large furuncles, and cellulitis. Control bacterial colony counts performed at intervals during the experiment on a

group of ten inmates who had the highest incidence of individual skin infections during the control period indicated that a corresponding decrease of bacterial skin flora paralleled the clinical results. It is concluded that the continuous use of G-11 soap is of decided value in the prevention of serious pyogenic skin lesions in institutional or other populations.

July 5

Comment and Criticism, *The Manchester, (England) Guardian Weekly*, Thursday, July 8, 1948:

"On Monday the National Health Service Act came into force, and the passing of the milestone was hailed with a chorus of praise, some of it perhaps too complacent. We are in process of making a great move forward. But only the first step, the legislative part of the move, is now completed. The larger part of the task is to come. It is a moment of opportunity, not of achievement. The health service which now comes into being is only the ground floor of the building. The rest will come; but it still wants building, not by M.P.'s or civil servants in Whitehall but by doctors and nurses and opticians and many more, by members of the regional hospital boards and the local hospital committees. There is now something solid to build on. The Act puts the hospital

services as never before on a sound and rational base; the regional boards will be able to make the best use of what hospitals there are. But they know better than anyone that new and better planned hospitals (and many more nurses in them) will be needed before we can call the hospital services wholly satisfactory. The whole population becomes, for the first time, entitled to the medical services hitherto available only to insured workers; the scandal of "under-doctored" areas will slowly disappear. But the full fruit of these reforms will not be ripe until the system of health centres has had time to grow, and that growth would be gradual even if lack of bricks and mortar did not inhibit it at the start. One must think of the health service as a huge natural organism in process of growth, not as a creature of magic, called out of the void by the wand of the Minister of Health."

How Long Does Immunity to Diphtheria Last?

ELI EICHELBERGER, M.D.

Director of Health, Department of Health, York, Pa.

THE feeling of security imparted to parents following routine immunization procedures of their offspring, especially diphtheria immunization, is due for some critical reëvaluation in the light of recent upsurges of this disease. Such protective inoculations have become accepted routine procedures among private physicians, pediatricians, and health authorities. Children are now offered immunization against diphtheria, whooping cough, and tetanus, either singly or all combined in one injection. On the basis of accumulated published reports most, or all, of these procedures offer a high percentage of immunity when measured in periods of 6 to 18 months following the initial immunization.

The U. S. Public Health Service¹ reported an increased incidence of diphtheria in the United States during the late spring of 1945, and this increase

continued on into 1946. During the calendar year of 1945, a total of 18,669 cases of diphtheria were reported, more cases than in any year since 1939. In 1946 there were 16,193 cases reported and 12,511 cases in 1947. Information regarding the age distribution of such cases was not available from the U. S. Public Health Service, since such figures are not furnished by the various state health departments. However, reports gathered from the State Health Departments of Pennsylvania, New York, Massachusetts, and California² regarding the age distribution of cases reported in those respective states during the years 1945 and 1946 are given in Table 1.

From these statistics it becomes apparent at once that no age group is immune to diphtheria. The figures from Pennsylvania reveal that 31.5 per

* Excluding New York City

cent of the reported cases in 1945 and 25.4 per cent of the cases in 1946 occurred among infants and children under 5 years of age. The New York State average in 1945 was 20 per cent but fell considerably below this figure in 1946. In Massachusetts, 20 per cent of the cases of reported diphtheria occurred in this preschool age group in 1945 and 26 per cent of the reported cases in 1946. California reported approximately 25 per cent to 27 per cent of diphtheria cases in this same age group in the years 1945 and 1946.

A survey conducted by the York City Department of Health in 1946 regarding diphtheria immunization among first grade pupils prior to entering school revealed the fact that, of 956 pupils enrolled, only 282 pupils or 29.5 per cent of pupils had received diphtheria immunization in preschool years. It is probably the general impression that a much higher percentage of preschool children would have been offered this protection much earlier in life. Such a startling low figure for diphtheria immunization in this critical age group shows that this community and probably many such communities are not "adequately" protected against diphtheria. It is not surprising then that the incidence of reported diphtheria is relatively high in this age group.

In evaluating the occurrence of diphtheria in the inclusive age groups from 5 to 19 years of age, it is found that in Pennsylvania 40 per cent of the total cases in 1945 and 52 per cent of the cases in 1946 occurred in this school age group. The figures for the same age group in New York State are 52 per cent of cases in 1945 and 56 per cent of cases in 1946. In Massachusetts, 45 per cent of the total for 1945 and 57 per cent of the cases in 1946 occurred in the age groups 5 to 19 years. Approximately 50 per cent of the cases reported in California for the years

1945 and 1946 occurred in this group.

In a further breakdown of these figures it is found that the incidence of diphtheria in the 5 to 9 year group in all the reported states was 26 per cent in 1945 and 29 per cent in 1946. In the 10 to 14 year group the incidence of diphtheria was 12 per cent in 1945 and 14 per cent in 1946. In the 15 to 19 year group, the diphtheria incidence was 8 per cent in 1945 and 7 per cent in 1946. Considering the total percentage in the age group from 10 to 19 years of age we find that 20 per cent of the cases reported in 1945, and 21 per cent of the total in 1946, occurred in this class.

From these figures it becomes obvious that diphtheria can no longer be considered a disease of infancy and childhood alone. Such statistics bear out the conclusions of an editorial in the *Journal* of the American Medical Association⁴ which concluded that diphtheria was increasing and that there was a tendency for the disease to become relatively more prevalent among the older age groups. It appears that our thinking regarding this disease will have to be revised, as well as our evaluation of the duration of diphtheria immunity. If a large per cent of adults are now susceptible, it must be assumed that they must never have been immunized, or if previously immunized, they must have lost their immunity. Consequently, one who thinks of diphtheria as a childhood disease may entirely miss the diagnosis in the adult unless facts regarding this disease are appreciated.

With this thought in mind, it was decided to evaluate the duration of immunity in a representative group of children who had been immunized artificially some years previously. For this program, Schick tests were offered, on a voluntary basis to the junior and senior high school students in the York City schools. These pupils had been pre-

viously immunized to diphtheria in either the preschool years or in the grade school immunizing program conducted yearly. The group tested included the seventh, eighth, and ninth grades in the junior high schools and the tenth, eleventh, and twelfth grades in the senior high schools. The age groups corresponding approximately to 12 and 14 years for the junior high school students, and 15 to 18 years for the senior high school students. In the group tested, an interval of 5 to 12 years had elapsed since the original diphtheria immunization, this depending upon the age and the grade of the individual tested. The results of the program are outlined in Tables 2 and 3.

TABLE 2

Schick Tests Among Junior High School Pupils

| Grade | Total Tested | Schick-negative | Schick-positive | Per cent Positive |
|---------|--------------|-----------------|-----------------|-------------------|
| Seventh | 414 | 355 | 59 | 14 |
| Eighth | 413 | 334 | 79 | 19 |
| Ninth | 423 | 316 | 107 | 25 |
| Totals | 1,250 | 1,005 | 245 | 20 |

TABLE 3

Schick Tests Among Senior High School Pupils

| Grade | Total Tested | Schick-negative | Schick-positive | Per cent Positive |
|----------|--------------|-----------------|-----------------|-------------------|
| Tenth | 308 | 245 | 63 | 20 |
| Eleventh | 393 | 322 | 71 | 18 |
| Twelfth | 418 | 348 | 70 | 17 |
| Totals | 1,119 | 915 | 204 | 18 |

Some of the teachers in the various grades wished to be tested, although this was not a scheduled portion of the program. However, the results of the Schick tests among the teachers revealed such a high percentage of reactors that the results of the survey are recorded as a by-product of the pupil survey (Table 4).

The results of this survey indicate that a relatively high percentage of pupils in the junior and senior high

TABLE 4

Schick Testing Among Teachers

| Number Tested | Number Negative | Number Positive | Per cent Positive |
|---------------|-----------------|-----------------|-------------------|
| 43 | 21 | 22 | 51 |

schools have lost their immunity to diphtheria. An average of 20 per cent were Schick-positive among the 1,250 junior high school pupils tested and an average of 18 per cent of 1,119 senior high school pupils. All pupils with a positive reaction were given a "booster" dose of 0.5 ml. of alum-precipitated toxoid. No untoward reactions were encountered among the 449 pupils given this stimulating dose. A few pupils developed some soreness and redness at the site of injection for a day or so, but beyond that there were no other reactions.

While it is well known that adults do not tolerate alum-precipitated toxoid very well, the dose of 0.5 ml. can be considered a safe dosage in this particular age group. A much smaller dosage was administered to a few of the teachers who had a Schick-positive reaction. A dose of 0.1 ml. was administered and 2 teachers had a local as well as a generalized reaction. The local reaction showed redness and swelling at the sight of inoculation and the systemic reaction consisted of chills, fever, headache, and weakness which incapacitated for a day or two.

DISCUSSION

While Schick testing may be questioned as an inadequate measure of diphtheria immunity, it is still the most effective measure from the standpoint of ease of administration in any mass testing. It is generally conceded that an individual with 1/250 units or more of antitoxin per milliliter of blood will have a negative Schick test. In testing this group 0.1 ml. of the Schick testing toxin was injected into the skin of the

forearm and the readings were taken just one week later. A tuberculin syringe was used for accurate measure of the dosage and a platinum-iridium needle used since it could be flamed between each test to protect against infection in the testing. By reading the results of the Schick test one week after the initial test dose it was felt that false or pseudo-positive were less likely to be included. It was found that many pupils developed a slight local reaction at the site of the Schick test which persisted for 24 to 48 hours and then faded away. A positive Schick test persisted with some discoloration and desquamation at the site of the original test.

The results found in this group testing compare favorably with other reports in the medical literature. Bullock⁵ found that only 76 per cent of patients admitted to Willard Parker Hospital were effectively immunized by current routine procedures; 24 per cent of 200 previously immunized patients admitted for diseases other than diphtheria were found to be Schick-positive. Karelitz⁶ found that of 1,283 persons tested among Army personnel, 28.6 per cent were found to have a positive Schick test. Nevius⁷ reported on the study of 72 immunized children who were Schick-negative 1 year after the initial inoculation but who again were tested at the end of 5 years. Only 58 of the 72 children were still Schick-negative or 80 per cent of the group studied. Lyon and Mitchell⁸ reporting on the results of Dick and Schick tests in children previously immunized, found that Schick reactions in children of school age became positive at the rate of about 13 per cent after 1 year, and 16 per cent after 2 years.

Schwartz and Janey⁹ found that 22 per cent of 145 children tested reverted from a negative to a positive Schick reaction 6 to 7 years following the administration of toxoid. Bundesen,

Fishbein, and White¹⁰ found reversals in Schick tests in various classified groups ranging from 6.4 per cent to 18.9 per cent. They felt that the present type of inoculations being used throughout the United States could not be relied upon to produce permanent immunity. Schwartz¹¹ found 16 per cent of a group of children tested 3 to 5 years following diphtheria immunization were Schick-positive. For a group receiving toxin-antitoxin initially and retested 8 to 10 years later, 26 per cent were Schick-positive. For another group receiving initially 2 doses of toxoid, retesting 4 to 10 years later revealed the fact that 22 per cent had lost their immunity. In all, for 308 cases retested there was a loss of immunity in 20.8 per cent in from 3 to 10 years following the initial immunization.

An accumulation of such statistics in the medical literature tends to confirm the impression that diphtheria immunity is not a life-long immunity. Therefore, in order to protect susceptible children as well as adults, booster doses of diphtheria immunizing agents must be employed to protect a greater per cent of the general population. Certainly this procedure should be used immediately following any outbreak of diphtheria in a community. It is apparent from our studies that approximately 20 per cent of individuals immunized as children lose their immunity by the time they enter junior high school.

SUMMARY AND CONCLUSION

1. A review of the morbidity reports from the health departments of Pennsylvania, New York, Massachusetts, and California for a 2 year period reveals the fact that no age group is immune to diphtheria.

2. From these figures it becomes obvious that diphtheria cannot be considered a disease of infancy and childhood alone, but may occur at any age.

3. In a Schick testing program con-

ducted in three junior high schools and in a large senior high school in York, Pa., of previously immunized pupils it was found that 20 per cent of 1,250 pupils in junior high and 18 per cent of 1,119 pupils in senior high had a positive Schick test.

4. Booster doses of 0.5 ml. of diphtheria toxoid were administered to those found positive. This dosage was well tolerated by this school age group.

5. Loss of diphtheria immunity, as measured by the Schick test, compares favorably with other reported figures published in the medical literature.

6. Diphtheria immunity is certainly not a lifelong protection and approximately 20 per cent of individuals immunized as children will require a "booster" dose of toxoid to protect them adequately as adults.

NOTE: Grateful acknowledgment is made to the school nurses and the health nurses for their aid in the collection of statistical data and in the actual testing program.

Mental Health Training Grants

Late in July the Federal Security Agency made public a list of institutions to which federal grants have been made for stipends to postgraduate students training in psychiatry. It includes 21 institutions in 13 states and the District of Columbia.

These grants go to universities, hos-

pitals, and clinics to support their training programs. The list of institutions receiving stipend grants, together with the address and head of the department can be secured by prospective applicants from Federal Security Agency, Public Health Service, Mental Hygiene Division, Washington, D. C.

The Relationship of Training, Sanitation Personnel, and Environmental Control

A Philosophical Approach

WILLIAM T. INGRAM, M.P.H., F.A.P.H.A.

Engineering Field Associate, American Public Health Association, New York, N. Y.

SANITATION: What is the job? How is it done? Who does it? How much and what kind of training is needed? Materials for an approach to these questions have been drawn from the ideas of many persons. A list of basic disciplines was prepared by Dean Gordon Fair 10 years ago. Many engineers, sanitarians, and others in teaching and field positions have contributed.*

It has been necessary to use some subjective material for the sake of development of the approach. However, this, in itself points out the need of objective study. (Sound research to obtain objective data.)

FACTORS TO BE RELATED

Examine Chart 1, Integration of Training, Sanitation Personnel and Environmental Control. Look first at the Components of Environmental Sanitation. Controls are based on the factors of air hygiene; adequate and safe water supply; liquid and solid waste disposal; soil hygiene; food sanitation, including milk; control of insect and animal vectors of disease; and control of physical facilities of the living and working environment.

Look next at the Integrals of Knowledge. Basic knowledge of the chemical, physical, biological, and social sciences is required for efficient performance of work involving any one of the components of environmental sanitation.

Now look at the Disciplines. These are the basic disciplines of knowledge and are not to be confused with applications. Fair agreement on the disciplines prevails. The degree of use of disciplines does not enter into consideration at this point. It is sufficient to determine that as fundamentals they are or are not needed in carrying on work involving the components of environmental sanitation.

Between knowledge and the application of knowledge stands the individual who is expected to work in some capacity on environmental control. This individual must have some degree of Aptitude and Ability for his work. He must have certain specific intellectual and personality characteristics, certain physical ability, and certain skill to be able to carry on his work successfully.

The character of the work and the individual responsibilities for successful performance must be determined by an evaluation of the job to be done. An evaluation of a specific position must consider field of work, responsibility, supervision, professional activities, and

* Constructive criticisms of a draft prepared October, 1947, and numerous discussions with the writer.

promotional opportunities. Subject to limitations of aptitude, ability, and responsibility the individual applies his knowledge to one or more of the components of environmental sanitation along coördinated, integrated lines. His knowledge is obtained through instruction gained academically and through in-service training. It is mellowed, seasoned, and supplemented by experience.

Translation of knowledge is accomplished by instruction in principles, applications, and methods or techniques.

JOB REQUIREMENTS

Turn now to Chart 2, Position Requirements. Observe the Responsibility Levels. There are various combinations of responsibility in environmental control work, but even so some fundamental classifications can be expressed according to the degree and kind of supervision. These classifications form the basis for establishing 3 directional levels and 3 supervisory levels of responsibility generally acceptable to personnel officers. The levels may also be grouped in professional terms keyed to the caliber of work expected from the individual. Thus, the last 4 grades are professional while the first is technical and the second is sub-professional.

The knowledge required is stated generally, because there is insufficient objective information available to correlate Knowledge requirements to Job Evaluation. One sees that at this point there is a necessity for an evaluation of programs and jobs which will lead to a sound determination of the kind and degree of instruction that is required for a given position.

TRAINING

Study Chart 3, Translation of Knowledge. Under the headings of Principles, Applications, and Methods and Techniques are listed details of the Disciplines of Knowledge which constitute

the training basis for sanitation personnel. It will be apparent that these still make no reference to an actual curriculum of teaching. Curricula should be established by specific academic institutions in keeping with the teaching facilities of such institutions and in accordance with the degree of understanding of the relationship between required knowledge and field practice utilizing that knowledge. The following should be noted: Principles acquaint the student with the fundamentals of the subject matter; Applications, with the means by which one or more principles are combined and utilized; Methods, with the manner in which one or more principles are applied; and, Techniques, with the style of doing a specified task.

Techniques can be taught with minimum background knowledge of principles and applications and lend themselves to in-service training or special short courses. Some Methods can also be taught with minimal supplementary explanation of principles, but, in the main, presume a wider background of knowledge than do techniques. Applications cannot be taught without concurrent and in many cases prerequisite knowledge of the principles involved. The teaching of principles and applications using carefully built foundations of instruction is limited almost completely to academic institutions. I would add that the teaching of complex methods involving several principles such as those listed under physical science is limited to academic institutions whenever thorough understanding is the objective. There is a wide gap between thorough understanding and the familiarity achieved in short training courses. In general, instruction can best be given in universities and in university sponsored field training.

The chart, Translation of Knowledge, can be used as a templet:

1. To explore the bases of knowledge to which the individual has been exposed.

2. To serve as a specific guide to the kind and degree of knowledge prerequisite to a given professional specialty.

3. To aid the graduate who has acquired some experience and an understanding of his knowledge deficiencies in the selection of graduate courses of study that will support his professional inclinations.

4. To provide vocational counselors and

advisory professors in universities a positive guide that will assure both counselor and student a balanced building of basic knowledge with proper emphasis on special professional inclinations.

5. To guide those building curricula in the selection of courses which will qualify students for the responsibilities that will be assumed in actual practice.

6. To provide a positive guide to those who have responsibility for determining accreditation of sanitary engineering undergraduate and graduate curricula.

7. To guide personnel officers in proper review of a candidate's academic ability to perform in designated positions.

8. To provide a basis of rubrics on which valid written examination material may be prepared for specific examinations.

Selective templates could be developed for every occupation dealing with environment. Certain principles and applications common to all would be the foundation for various combinations of training. Today the only means of obtaining the several combinations is through difficult and often accidentally acquired academic instruction coupled with years of experience. Would it not be better to arrange facilities so that orderly increments of guided instruction could be available to the student who seeks opportunities for moving forward to levels of professional responsibility compatible with his personal and intellectual characteristics?

University training can be obtained in stages, such as 2 years of junior college or lower division work, 2 years of upper division undergraduate work, and 1 or more years of postgraduate work. Experience may be gained between any of the above stages or during vacations. It is demonstrable, subjectively, that with a higher level of initial education to which nothing but experience is added, the time interval required to reach the higher levels of responsibility is markedly less. It is also demonstrable that in general, there are limits of rise in responsibility for those with fewer than 4 years of university education. It is exceptional to obtain adequate knowledge of the required disciplines in less academic time. There are indications that even individuals with 5 years of academic education may strike maximum professional levels below those ultimately open to

persons with 6 years of education and broad experience.

COMMENT

Visualize, if you will, the templates which might be constructed for these environmental control positions: Consulting Sanitary Engineer, Municipal Engineer, Public Health Engineer, Water Supply, Sewage Disposal or other Sanitary Engineer Specialist, Industrial Hygiene Engineer, Sanitarian Supervisor, General Sanitarian, Sanitation Aide, Municipal Utility Superintendent, Water Plant Operator, Sewage Plant Operator. Perhaps there are others I have neglected to mention. Couple these with programs of environmental sanitation which involve one or more of the components of environmental control. Recognize that there are jobs of many descriptions and levels of responsibility and return now and review the chart, Integration of Training, Sanitation Personnel, and Environmental Control in the light of the foregoing explanation.

It should be apparent that there is much to be done to consolidate objective information and to accelerate action on the particulars of (1) Program evaluation, (2) Job evaluation, and (3) Training. At least two major lines of action ought to be followed if fundamental progress is to be made: (1) Critical investigation and demonstration of such basic factors of sanitation administration practice as job evaluation and program evaluation; (2) Research, consultation and advice in training and education for personnel to be employed on sanitation work, including the establishment of professional concepts encompassing the entire series of functions within the scope of environmental sanitation.

Sanitation: What is the job? How is it done? Who does it? How much and what kind of training is needed? Do these questions have answers?

Medical Care Plans for Industrial Workers and Their Relationship to Public Health Programs

LEE JANIS, M.D., AND MILTON I. ROEMER, M.D.,
M.P.H., F.A.P.H.A.

Chief, Health Insurance Section, General Headquarters, Commander in Chief, Far East, Tokyo, Japan. Formerly with Industrial Hygiene Division, U. S. Public Health Service; Associate in Medical Care Administration, States Relations Division, U. S. Public Health Service, Washington, D. C.

THE war and post-war years have seen a great expansion of interest in health and welfare programs for industrial workers. Major negotiations between labor and management have hinged on the provision of various types of group insurance programs, most of which bear some relationship to the provision of medical services. Public health agencies have had little relationship to this entire movement, it being regarded as an aspect of collective bargaining—a matter between employers and employees. Frank appraisal of the health problems of industrial workers, however, must lead to the conclusion that public health agencies have a vital concern with the problems of industrial medical care.

The most elementary basis for this concern devolves upon an analysis of the composition of illness or absenteeism in industry. For if public health and particularly industrial hygiene is concerned with the health of industrial workers, we obviously must analyze how much illness may be controlled by preventive activities in the factory and how much requires other approaches.

COMPOSITION OF INDUSTRIAL ILLNESS

In 1938, Newquist¹ demonstrated a fact that many had suspected for a long time: "The average worker loses 15 times as much time from non-industrial injuries and illnesses as he does from industrial injuries." Even when occupational diseases are included, disabilities from "industrial" causes appear to account for only 6.3 per cent of total absenteeism from illness and injury in industry.

Since the distinction between occupational and non-occupational illness depends largely on compensation records, it has been claimed that the concept of occupational origin of illness is restricted by the relatively narrow definitions of workmen's compensation law. Many conditions now widely regarded as occupational in origin—for example, tuberculosis in miners or pneumonia in steel workers—were not so regarded a few years ago or are still excluded from compensability in some states. By the same token, many conditions now regarded as of non-occupational origin may eventually be traced to working conditions. There is surely some valid-

ity, therefore, to the claim that working conditions may have a greater influence on health than present absenteeism records appear to indicate.

It is probably wise to conclude, with Stern,² that the worker's health is "the result of a complex causal pattern involving not only inferior living conditions associated with low income, but also the working conditions of persons in the low income categories. Fatigue and excessive physical and mental tensions on the job, as well as exposure to hazardous materials, may sometimes lead not directly to industrial disability now compensable under the law, but may lower the powers of resistance of workers to communicable diseases and may aggravate chronic diseases." Much disability and death not now regarded as occupational, therefore, as well as that which is strictly occupational, may be reduced by effective programs of industrial hygiene, in the preventive sense.

The fact remains that the great bulk of illness and injury among industrial workers—probably close to 90 per cent in terms of days lost—cannot be regarded as reducible by a program of preventive services in the factory.³ Beyond the inroads on the problem that can be made by general public health activity in the community, it is evident that some approach to the better organization of medical care for non-occupational illness and injury is necessary.

Although not many public health agencies have in the past recognized this, labor and management groups have seen it perhaps more clearly than they have seen the value of preventive efforts. Absenteeism due to illness represents a financial loss, not to mention the human suffering, to workers and their families. To management it represents economic losses and complications in the production process.⁴ It is natural, therefore, that both labor and management in the United States should have been active for more than a century in set-

ting up various programs for organizing the costs of, or the actual provision of, medical services.

DEVELOPMENT OF MEDICAL CARE PROGRAMS FOR INDUSTRIAL WORKERS

The development of today's widespread interest in industrial medical care stems from a background of two main streams of activity: (a) efforts to indemnify workers for wage loss in illness and for the costs of medical services; (b) efforts to provide direct medical services as needed. Both types of activity have been sponsored separately by labor or management and jointly by both. Both types still operate side by side, although the trend, as we shall see, appears toward the cash indemnification type of program with joint labor-management administration.

Indemnification Programs—The earliest efforts to cushion the risk of sickness were made by workers themselves in the late 18th and early 19th centuries. They first took the form of mutual aid societies which paid cash benefits to the family, on the death of the breadwinner, for burial expenses and for general aid. Later cash benefits were paid in the event of prolonged sickness. The historic origin of these organizations is found in England's "friendly societies" or Germany's workmen's orders, although somewhat similar patterns are found even in antiquity.⁵ Some of these benevolent associations, like the Free African Society, later became insurance companies.⁶ Others gradually assumed "industrial" functions, like collective bargaining for wages and hours, and became labor unions in the current sense.⁷

Whether mutual aid societies became departments of unions or continued independently, their principal function became cash indemnification of workers for wage loss during periods of temporary disability due to sickness or injury. The course of these "mutual sick benefit associations" or the "sick bene-

fit funds" of unions was stormy. Rarely based on sound actuarial principles, they frequently got into financial difficulties.⁸ In the interest of improved personnel relations, employers gradually began to sponsor them, offering clerical assistance or even partial assumption of the risk to induce employees to join. Employers seldom made significant financial contributions, however, and workers frequently refrained from joining on suspicion of management's objectives.⁹

About 1912 private insurance companies entered the field of group temporary disability insurance.¹⁰ They were able to assume risks that individual employers did not wish to carry and could save the employer the administrative duties involved in operating such programs. As a result, commercial group insurance gradually came to replace both the mutual sick benefit associations and union sick benefit funds. From about the 1930's, commercial group policies began to indemnify against the major professional costs in serious illness, like hospital and surgical expenses, as well as for wage loss. The larger share of premiums was typically paid by the workers until the second World War, when the relatively tight labor market, combined with the government wage stabilization program, put labor in a favorable position to make special claims on management. In lieu of offering wage increases, therefore, management has come to assume a major share of the cost of these group insurance policies today.¹¹

Direct Service Programs—Concurrently with this development was another stream of activity in which organized systems of medical service were made directly available to groups of workers. In the mid-nineteenth century, when railroads were being cut through to the West, timberlands were being cut into, or mines were being opened, medical services were needed

for the isolated groups of men doing this work. Cash benefits would do little good under such circumstances; doctors and hospitals were the first need. Periodic wage deductions were an obvious device for assuring a fund to pay physicians and support facilities. Typically, medical personnel were on salary and the workers were entitled to service, as needed, without paying fees.¹²

In the early 20th century, this pattern of organized medical care plans spread to many parts of the country, although it has been set up chiefly in heavy industries. While financed in most instances entirely by employees, through wage deductions, the administration has usually been through management. One of the best known of these programs—and one of the few financed entirely by management—is at the Endicott-Johnson Shoe Corporation, Binghamton, N. Y. Among more recently developed medical service plans, perhaps the best known are the various Permanente Foundations for workers in the Kaiser shipyards on the West Coast.¹³ The bituminous coal agreement of 1946 elevated the entire question of so-called "contract medical practice" in the mine fields to a question of national concern. As a result of an extensive survey of the bituminous coal industry,¹⁴ plans are now under way to reorganize medical services for some 400,000 miners and their dependents on the basis of employer contributions to a trust fund.

A further development in direct service plans has been the effort, here and there, of organized labor itself to provide medical care for its own ranks. The first of such projects was undertaken in 1916 by the International Ladies' Garment Workers Union in New York City, with the establishment of the Union Health Center, still operating and now offering ambulatory medical care to union members.¹⁵ Another was set up about 1940 by the United Auto-

mobile Workers in Detroit for limited diagnostic service. The most comprehensive of such plans has recently been launched in St. Louis under the auspices of the United Retail, Wholesale and Department Store Employees. Here medical personnel on full-time or part-time salary render complete care to union members and their dependents in the Labor Health Institute. Unlike other labor-sponsored plans, this one is financed entirely by management.¹⁶

A final type of medical service plan providing benefits for industrial workers may be mentioned. This is the type of *prepayment plan developed by groups* outside of industry, controlled by neither labor nor management, in which workers may be enrolled along with other groups. Most important of this type of program have been the plans for hospitalization insurance starting in 1929 and now known generally by the Blue Cross emblem. In some states, like Michigan or California, the largest share of membership in these plans is made up of industrial workers. Still more recently, the medical societies have organized prepayment plans, typically for surgical services in the hospital, in which many industrial groups are enrolled. New York City has become the site of a unique prepayment plan, sponsored by many community agencies and rendering service through group practice units, in which a number of labor unions are enrolling their members.¹⁷

PRESENT COVERAGE

With these various streams of development, the present picture of organized health services in industry is quite complex. Expressions of the several different lines of organized action are all to be found today. There are still some mutual aid associations indemnifying workers for wage-loss and medical expenses. There are abundant group insurance policies for temporary disability and medical costs carried by commercial

companies. There are many organized medical services offering direct care under the sponsorship of management and a few under labor control. There are numerous non-industrial medical care prepayment plans in which factory groups happen to be enrolled.

It is difficult to give exact statistical data on the coverage of the various types of plans reviewed above. Much of the information on one type of coverage overlaps with data on other types, so that a reliable total figure cannot be cited. The most recent studies, nevertheless, yield the following information: *In 1945 there were about 115 organizations providing direct medical service of relatively comprehensive scope to about 1.5 million workers and dependents.*¹⁸ Cutting partly across the lines of these were the 600 mutual benefit associations providing cash indemnification for temporary disability and usually for surgical and hospital expenses to about 1.5 million employees.¹⁹

From the point of view of the present rate of growth, the most significant type of industrial program today is the cash indemnification plan under commercial insurance companies. By 1947, it was reported that 10,548,000 workers and dependents had indemnity protection for hospital costs, under such auspices; 7,916,000 had indemnity for surgical costs; and 615,000 had medical indemnity benefits in hospitalized illness.²⁰ (These figures cannot be added since there is considerable overlapping of the same persons in the different policies.) Many of the workers covered by these indemnity policies receive the protection as a result of "health and welfare" provisions in labor-management contracts, concluded through collective bargaining.²¹ It is estimated that in 1947 some 4 million workers were encompassed under such health and welfare clauses.²² These contracts usually provide for various combinations of group life insurance, accident and sick-

ness (weekly wage-loss indemnity) insurance, accidental death and dismemberment insurance, hospitalization expense insurance, surgical expense insurance, and sometimes medical (non-surgical) expense insurance.

Finally, there are the approximately 26,000,000 persons covered by Blue Cross group hospitalization and the 6,500,000 covered by medical society plans for surgical and obstetrical care as of January 1, 1947.²³ Very likely a majority of these represent employed workers, covered by virtue of their belonging to a factory group, but exactly how many cannot be stated.

EVALUATION

It is easy to understand why cash indemnification policies have pleased both labor and management and have grown rapidly. For one thing, they have meant indirect wage increases for labor, in so far as costs have been borne by management. From management's point of view they have promoted good personnel relations and they have been an agreeable form for allowing wage increases (since they do not constitute a raise in base pay, by which overtime rates are computed). From the point of view of both labor and management, they have been administratively simple, since most of the technical details are handled by the commercial carrier. There has been no organizational task involving delicate relationships with professional groups, hospitals, and other providers of service, as called for in the establishment of medical service programs of all types.

There is no question about the positive value of these group insurance programs. They have helped to cushion some of the heavy costs of catastrophic illness and to make it easier for the worker to obtain needed surgical and hospital care. The costs of protection have been considerably lower than for individual "health and accident" in-

demnity policies offered by commercial carriers. Still, certain questions have been raised about the entire indemnification pattern. Unlike the pattern of service plans (e.g., Blue Cross or many medical society plans), it does not assure the provision of services but rather gives a certain amount of cash to help defray costs. The services for which indemnification is offered are generally limited to the needs of serious illness, without protection for the costs of day-to-day home and office medical care, which has higher preventive value. Even in catastrophic illness, one study has shown that the average commercial policy indemnifies the worker for only about 50 per cent of the total charges incurred in his illness.²¹ Analyses by Professor Blanchard of Columbia University, moreover, reveal that only 62 to 75 cents of the premium dollar are returned to the workers in the form of benefits.²⁵

Despite these facts, group indemnity policies have undoubtedly been a step forward. The reluctance of both labor and management to embark on the organization of service plans has doubtless been, partly, because the issue has been narrowed often to a choice between indemnity insurance and that special type of service plan in which an organized staff of salaried medical personnel is employed. In industry, this has taken the form of debate concerning the extension of the usually accepted in-plant industrial medical service to include care for non-industrial illness. Opponents of "extended medical service," like Newquist and Hess, claim that "the purpose and license of industry is not to practise medicine. If for no other reason than a sense of fair competition, industry should go no further in the actual treatment of non-industrial injuries and illnesses than to give reasonable first aid and advice to those on duty."²⁶ Proponents like Wittmer or Lynch, however, state that "If the medical cost

for the treatment of occupational injury and disease is a proper charge against production, so also is the cost of the medical care for workers too sick to work, a proper charge against production, because workers prevented from working by sickness produce nothing for the profit of industry and nothing for themselves and their families . . . I recommend that industry generously and for profit arrange adequate medical care for the sick as well as the injured before compelled to do it, with the coöperation of organized medicine, without it if necessary."²⁷

Labor has been far from enthusiastic about programs providing actual medical service for other reasons. As for company-operated plans with salaried personnel, there has been the usual objection to so-called paternalistic practices. Workers have frequently been reluctant to entrust their personal problems to doctors who are responsible directly to management. But even labor-sponsored medical care programs have been few and far between. The main reasons undoubtedly have been organizational. It is not easy for trade unions—preoccupied in the field of wages, hours, and working conditions—to take on the additional complex task of organizing medical service programs. If completely organized projects, with centralized health center facilities, are to be launched, large capital investments are usually necessary. There has sometimes been opposition to such enterprises from professional groups and hospital facilities have sometimes been closed to the plans. Even organization of simple prepayment plans, with payment of individual practitioners on a standard fee-for-service basis, has not been easy. Labor's chief participation in service plans has, therefore, been to sign up its members in the existing prepayment plans for hospitalized illness (Blue Cross and medical society plans). Much the greater participation, however, has been

in group indemnification insurance with commercial carriers.

Although they are more difficult to set up, service plans undoubtedly have several advantages over indemnity plans, from both health and economic points of view. The American Hospital Association has recognized this in its formulation of basic policies regarding Blue Cross plans. Even when the scope of services is limited, the worker tends to be assured of the receipt of the service offered in time of need. (The limiting factor may be the availability of personnel or facilities in the area but not the system of payment.) There is considerably more opportunity in service plans to encourage preventive services and to stimulate high quality performance. Overall costs of medical care for the worker are more fully insured, since there is no question of supplemental expenses beyond an indemnified amount.

Among service plans there are various considerations that, in one instance, would make advantageous the establishment of a plan with fee payments to individual practitioners and, in another, the establishment of an organized group practice program with personnel on salary. That the latter pattern tends to be most economical has been demonstrated repeatedly; it is well known from the experience of welfare medical administrators,²⁸ of the farm labor health program,²⁹ and of industrial medical services.³⁰ The salaried pattern tends, of course, to be associated with loss of free choice of physician, which is regarded as important by some persons. In any case, the participation by both labor and management in the administration of plans gives assurance of maximum economy and health content. The ultimate effect of recent labor legislation on the management of health and welfare programs is not clear at this point.

It is of some interest that an estab-

lished management-controlled, direct-service, organized medical care program like that of the Southern Pacific Railroad has recently been brought under the collective bargaining agreement between the employees and operators of that enterprise.³¹ The same has happened, in effect, to the coal mine programs. It appears as though labor groups which have had experience with direct service plans of some type tend to press for the extension of this pattern, while others are promoting cash indemnification programs.

RELATIONSHIP TO PUBLIC HEALTH

The very complexity of this entire field of health activity suggests its relationship to public health. Medical care problems, so charged with the difficulties of labor-management relationships, not to mention professional relationships, are urgently in need of the impartial guidance of a public agency skilled in health matters.

It is of some historical interest that almost the first official act of the then newly created Office of Industrial Hygiene and Sanitation of the U. S. Public Health Service in 1914 was to study the health of garment workers in New York City³² and that a principal result of this was the establishment of the first direct-service union-sponsored medical care plan in the nation, referred to above. Issues today are much more complex. In no two communities and in no two plants are the problems exactly alike. The underlying fact is that both management and labor are today inclined to spend money on health and welfare provisions. The immediate question is: how can each available dollar be spent to bring the greatest health benefit to the worker? The answer to this question will almost necessarily provide an answer to the corollary question: what type of program will provide the best labor-management relations?—for the most effective and economical pro-

gram should best serve the needs of both employer and employee.

Studies might be conducted by public health agencies to determine the results of different types of industrial medical care plans in their community—results in terms of volume of health services rendered, costs, absenteeism, working efficiency, quality of care, all the factors entering into a determination of the "health value per dollar." On the basis of such studies, practical advice could be offered to both labor and management groups concerning possible modification of their present practices or the best lines along which new programs might be organized. Such counsel, after all, is given every day with respect to in-plant industrial hygiene services. It will be more eagerly sought in medical care, simply because problems in this field today are felt by unions and management to be more pressing.

A medical care program of any one of the variety of possible patterns would complement a preventive program and in many ways make it more effective. Case finding efforts of an industrial hygiene service in the plant and of a health department outside the plant would be assured of better follow-up. The hernia detected in a preemployment physical examination could be assured of prompt surgical correction or the diabetes discovered in a routine prenatal urinalysis could be put under prompt medical control. Likewise, in day-to-day medical service, conditions of special public health interest might be turned up and referred to the health agency. A medical care program would, moreover, strengthen the routine industrial hygiene services in a plant, which public health is eager to advance. The very operation of a plan for medical care will heighten the interest of both management and labor in effective in-plant preventive activities, if only in the in-

terest of economy in expenditures for treatment. Close contact between physicians in the industrial hygiene service and those rendering medical care will keep the latter conscious of the problems of occupational diseases, so often missed by isolated practitioners.

Participation in the planning of these programs should strengthen the general position of the health agency with management, labor, and professional groups. To management, the assistance offered can be of practical value in reducing absenteeism and making for a better satisfied work force; employers want advice in this field more than any other.³³ To labor, assistance in the development of programs for medical service to themselves and possibly their families is obviously appreciated. While there has been in the past some suspicion by labor toward the organization of medical services on their behalf, this attitude has doubtless been related to the total setting of labor-management relationships.³⁴ As organized labor has matured,³⁵ and as the approach of public bodies has changed, labor's attitudes have changed.³⁶ To professional societies trying hard to face the challenge of a better distribution of medical care, the impartial assistance of public health agencies can only be welcome. Relationships developed with all these groups—management, labor, and the professions—should pay dividends in the development of community support for the general program of the health department.

CONCLUSION

In the whole movement for improving the organization of medical care for the general population, there is no more important trend than that of industrial health plans. The largest component of our national population is made up of industrial workers and the largest number of persons now covered by any type of prepayment plan are in this

class.³⁷ Whatever may develop in the way of community-wide medical care planning—local, state, or national—the patterns of organized service in industry will undoubtedly play an important part.

It is widely recognized that public health agencies face increased responsibilities in medical care administration in the years ahead. Acquiring a knowledge of the complex field of industrial health plans will stand them in good stead for this eventuality. Application of this knowledge to the pressing problems of industrial medical care in their own communities will enable them to render an invaluable public service today.

25. This does not mean that the insurance company necessarily retains the remainder of premium payments. A great part of the money not paid out in benefits is returned as dividends, but these are usually retained directly by the employer in partial compensation for his share contributed into the premium. Because the employer's contribution has usually been made, however, in lieu of a wage payment it represents, in effect, a payment from the worker's earnings. Even though these dividends are not kept as part of insurance company profits, the important point is that they seldom reach the worker. See: Blanchard, Ralph H. "We must believe in it against all discouragements, against all fail-

ures, against all betrayals. There is indeed nothing else we can do. For the long pull there is no alternative. Or rather, the only alternative involves a price in terms of cosmic disaster which, unless the world is overwhelmed by a Gargantuan madness, it will not consent to pay."—Raymond B. Fosdick, *Rockefeller Foundation—A Review for 1947*.

Community Resources for Health Education—How Well Are They Being Utilized in the School Program?*

Discussed by a Voluntary Agency Health Educator

BERYL J. ROBERTS

Director of Health Education, Massachusetts Tuberculosis League, Boston, Mass.

THE community approach is receiving a great deal of emphasis today in many fields of work, and those of us who are interested primarily in health education hear much about the desirability and values of community-wide health education. Certainly one essential step in the development of any such program is the utilization of community resources by the school and the continuous interaction between the school and the rest of the community—a bringing together of the school and the public, the two component parts of the total health education picture.

While there are some few who feel that the schools are separated from the rest of the community by a firm barrier, most of us recognize today that there are many community resources which the school may call upon to assist in the organization and development of its health program. The voluntary health agency is one which has particular contributions to make. Why then, we may ask, is it sometimes overlooked? Perhaps first of all, because the agency itself is at fault in not having made its services known. However, it is difficult to imagine an organization staffed with

a trained health educator who has not had contact with the schools in the area and has not offered services, for one of the first functions of a qualified health educator working in any kind of agency should be to make herself and her agency's work known. It is easier to imagine this lack of contact between agency and school where no qualified health educator is employed.

Another reason why the voluntary agency is not used may be that the school, being an official agency, looks to the other official agencies for help and advice. More and more, however, schools are reaching out into the community and utilizing not only the official but also the voluntary agency which is today stepping up its educational program and increasing its service.

If we proceed on the premise that the voluntary agency and the school will meet for mutual benefit, we might consider the kind of contribution a voluntary agency is in a position to make. Unfortunately, many belittle this kind of organization as a resource to be utilized by the school, but this is perhaps unjustified and will be increasingly so as more voluntary agencies wake up, add trained health educators to their staffs, and subsequently improve their programs. Perhaps there are some small agencies which function in the school

* Presented before the School Health Section of the American Public Health Association at the Seventy-fifth Annual Meeting in Atlantic City, N. J., October 10, 1947.

program only by channeling materials which may be used by the teachers in their classroom work, but many educators feel today that the growing and modernized voluntary agency has a much bigger job to do. Naturally, the amount of work it does will depend a great deal on the work the departments of education and health are already doing.

May I outline some of the ways in which the voluntary agency can be used as a resource by the school and mention those particularly which will enable the school to organize a total health program more rapidly and continue it more effectively than would perhaps otherwise be possible. These contributions are all of a practical nature since they have been tried by one voluntary agency or another.

1. Materials, of course, we recognize as a need in health education, not only to aid instruction and make it more "alive," but also to help inform teachers and administrators regarding the modern school health program in all its aspects. Teaching aids are not so available in health as in other subjects and many teachers turn to commercial materials. Several of our voluntary agencies now have teaching units, pupil materials, and various visual aids, which are sound, approved by educators, and useful. If teachers have not received such materials, they should request them. In addition to these materials, many voluntary organizations maintain libraries and loan folders which those associated with the school program may use in "self-education."

2. The voluntary agency may be utilized in a different way if the school wishes advice and consultation. Such service may be given personally by an agency educator trained in school or public health, or it may be brought in to the school from the outside. Local school departments, setting up or continuing school health programs, will

wish to use such consultant service if they find it available. It may be the only service of its kind available to the school or it may supplement that given by the official agencies in health or in education. Such help may consist merely of aiding the classroom teacher in working up a lesson or a unit of work, or it may involve a greater share in the program through membership on committees concerned with the total program.

3. The location of a qualified teacher is one of the difficulties encountered in setting up health instruction at the junior and senior high school level, where there is usually specialized teaching. In large schools, the establishment of a health instruction program requires the services of a full-time teacher trained in this field. Yet it is not easy to find such a teacher, and less easy to create a place for her. The employment of a health education teacher by the voluntary agency on a demonstration basis for a specified time and purpose can do much to "sell" her to the school itself and to the school committee who will ultimately decide whether or not she is a necessary addition. In smaller systems where a teacher already employed will assume health instruction as part of her teaching load, there is need not for a demonstration but rather for helping this teacher obtain additional training in health on a full- or part-time basis.

4. Teacher training has been and will be, of course, an interest of the voluntary agency. For some time, many have provided scholarships and fellowships. Now that school health programs are developing more widely throughout the country, our teacher-training institutions, both public and private, should consider their own health programs and offer more adequate pre-service training in health to teachers of all levels. Stimulating such institutions to do this and assisting them

in doing it well are functions of the health agency.

One of the basic lacks in teacher education is manifested by the new teacher's limited knowledge about the district or area where she teaches and about the community agencies and services. This lack is particularly felt by the teacher of health. If agencies can interest more of our teachers' colleges in training teachers to know the community, to understand and use what it offers—to have a community point of view—then our health instruction will profit immeasurably.

In this connection, the organization for which I work has been assisting one of the local teacher-education institutions during the past year by providing community field experience to teachers training in health education. This familiarizes the teacher with the health education program outside the school, acquainting her with agencies and groups which function in health education, and may be of value to her as a classroom teacher.

5. In addition to pre-service education, the organization of in-service training programs for personnel participating in school health work is also important. Workshops, informal conferences, institutes, and the like may be organized, not only locally but also on a regional and state basis. This provides opportunity for various school personnel to meet together and study with specialists, or to work in small groups on problems associated with pre-service and in-service training, or on the organization and continuation of a school health program. Voluntary agencies may be a stimulating force in helping to set up such study groups, their workers may participate as staff members, or they may aid financially. Tuberculosis associations have frequently worked actively in the school program in this manner.

6. Not the least contribution may

consist in providing students themselves with opportunities for active participation in the work of a community organization. This kind of personal experience can help to bring about an understanding of the functions of a voluntary health agency and at the same time develop an appreciation of the citizen's responsibility. The voluntary agency has been utilized too little in this manner.

While the community agency may be used mainly to enrich and expand the health instruction program, it can assist in other important phases of school health. Perhaps the greatest service in this respect will be through helping with training courses and possibly demonstrations.

Not to be omitted, is the aid the voluntary agency health educator may give in assisting the school in the education of parents, committees, and legislators. Health educators interested in the total community programs should have an area organized and ready for action in health education. This continuing organization of people and agencies may well be utilized by the school in interpreting its health work to parents and others.

The above are merely some of the ways in which the voluntary agency may aid the schools in their development in school health—the list is not at all inclusive. If you are a community health educator, you may be thinking of other ways in which you have served your schools; if you are a teacher or administrator you may be concerned with other types of service you would expect from your local health agency.

No one voluntary agency will perhaps be able to give all of the services we have listed, but each agency should give such help to the schools in whole or in part. The amount of service will vary, of course, with the size of the budget and staff of the community or-

ganization, and it will differ also according to the needs of the schools, the stage of development of the school program, and the kind and quality of service available from other sources. The voluntary agency should not duplicate contributions of the official agencies interested in health and education; they should, rather, supplement and enrich and, on occasion, demonstrate for a specified period.

Flexibility should be the keynote of the voluntary agency's school program. The type of service rendered should vary as need requires. It should change as the schools grow and expand in health education and as they develop a more permanent health program.

Some voluntary agencies have wondered, at the local level, whether they should be interested actively today in school health, whether or not school work, having been a part of their past program, is any longer an essential feature today. Certainly any agency interested in the total community health should maintain an interest in school health, for it is a necessary, basic part of a purposeful and continuing total program. Without it, community health education has no real roots and our efforts can hardly produce lasting results. Accordingly, any voluntary agency health educator should be alert to the needs of the schools and should recognize the school phase of community health education as a most important part of her work.

You may feel that there should be a more actively interested voluntary agency in your city or town. May I say here that if your local agency is not appropriately staffed, if it does not render adequate service to your school, then awaken that agency to its responsibility. As a resident of any given community, it is your responsibility and mine to stimulate voluntary agencies to employ good leadership and perform

the functions expected of them in the kind of health program accepted today.

The local voluntary agency most apt to have a health educator on its staff is the tuberculosis and health association, but there are several groups interested in and contributing to community health education and to school health as a part of it. While these latter groups may not employ specialists in health education at the local level, they may provide community resources for the school. These many agencies cannot all run in and out of the schools, as they will, with suggestions, ideas, and aids, separately and distinctly. There must be some coordination of effort between the groups endeavoring to serve the school. Integration of contributions of the several agencies may be simpler where the school program has leadership in the form of a health director. Perhaps a school health council could perform a real function in defining the needs of the school, locating community resources which can be of help, and arranging for the utilization of such resources in a sensible, efficient way.

In closing, I would like to emphasize the importance of the continuous interaction between school and community. Voluntary agencies outside the school have real contributions to make for the enrichment and growth of the developing school health program. They also bring to the school a knowledge of community health problems and facilities.

They *should* be used and *are* used by progressive schools which are today reaching beyond the school walls to the outside to an increasing degree. A close relationship between school and public education programs will enable us to achieve what is now our goal in health education—a well integrated program actively reaching all corners of our communities.

Community Resources for Health Education—How Well Are They Being Utilized in the School Program?*

Discussed by a Health Officer

GEORGE JAMES, M.D., M.P.H., F.A.P.H.A.

Commissioner of Health, Ulster County Department of Health, Kingston, N. Y.

The Health Officer Looks at School Health

Since the time when the "Divide and Conquer" rule was applied to the problems of public health, the health officer has been faced with an increasingly complex mosaic made up of the many units into which his work has been divided. Indeed, so complex have been these divisions, and so specialized their fields, that the mosaic at times has lost its total meaning. The trained observer can note much intricacy of pattern indicative of frenzied activity. He can see that trained experts in tuberculosis and cancer have developed independent programs of community service, while he notes that even the problem of child health has been divided into the categories of infant, preschool, and school.

Of course, this division of services into specialties has been an essential step in our battle toward a healthier world. Public health has progressed a long way from the days when communicable disease and sanitation were its only fields of effort. The progress of sanitary science has made the services of numerous experts necessary to the health program, if this program is to discharge its duty adequately to the citizen. Nevertheless, it is encouraging

that the present trend is toward co-ordination of all health effort, and it is the health officer who must accept the burden of this responsibility. It is up to him to see that every individual in the community is given an opportunity equal to his specific need, so that he may take advantage of modern progress in health during every stage of his life.

The health officer must recognize the preponderance of certain problems in particular age groups. He must be prepared to understand and utilize the health programs of other agencies, but he cannot ignore any large body of citizens because for a time they may seem temporarily beyond his immediate control. Such a group in some areas is composed of the school age children in the community. Regardless of which official agency, health or education, has been charged by law with the responsibility for school health, the health officer must accept the task of doing all within his power to integrate school health with the entire community health program which includes all age groups and problems.¹ He cannot ignore this opportunity to bring health knowledge to a member of virtually every family in his area, the chance to influence the personal health activities of the parents of tomorrow, and the last convenient opportunity to prevent or correct many future irremediable defects. He cannot throw his personal

* Presented before the School Health Section of the American Public Health Association at the Seventy-fifth Annual Meeting in Atlantic City, N. J., October 10, 1947.

forces into the battle of preschool health without being concerned with the follow-up to his efforts which is part of the school health program.

It is, therefore, up to him to point out worth-while procedures to school administrators, to organize community health councils, to see that they have positive programs, and to make his facilities available to the school health programs. Naturally, the school administrator should coöperate in this work, should be eager to improve his health program, should seek active participation of his charges in community health activities. But whatever the extent of school authority, initiative, interest or coöperation, the fact remains that it is the fundamental responsibility of the health officer to exhaust all possibilities for furthering school health programs to the same degree that he accepts responsibility for those programs which may be more directly administered by him.

The Health Officer Looks at Health Education

Recently I read a symposium on health education in the *Journal*.² Most of the contributors stressed the fact that, in a democracy, health education is essential to secure good health practice and required public support for health programs. The 'difficulty with much of the health education effort today is that while attempting these goals it drives toward the specific. It makes us venereal disease conscious in February, it worries us about tuberculosis in December, and makes poliomyelitis seem like the world's greatest problem in January. Health departments mobilize for a huge diphtheria campaign in September and then train their big guns on some other program as soon as the desired effect is achieved.

Commercial advertisers have proved to us that it is the constant repetition rather than the brilliant campaign that

achieves lasting results. Health officers have realized that while campaigns aimed at achieving specific ends are worth while, there is a far greater need for an organized, continuous, and consistent health education program which covers not only all phases of health but reaches all groups in the community. There appears little doubt that this organized program can be carried out successfully in the public schools of our nation.

Coöperative Efforts Between Schools and Health Departments

A. *Introduction*—Coöperative efforts between school administrator, health officer, and all community health agencies now, will minimize sales resistance to health in the future. Health resources in the community must be made an integral part of the school health education program, if the school is to participate in such an organized community plan.

The health officer who is cognizant of the major health problems facing his community is in the best position to point out to school authorities where specific efforts in health education might be made. He is one official whose program cannot become static, his syllabus and curriculum are always changing. School administrators should look to him for suggestions in regard to our changing health needs, and for assistance in periodically revamping health education curricula.

B. *A Sex Hygiene Program*—In a small southern village we once thought of carrying out a venereal disease survey in a Negro high school. Realizing that most of the Negro adolescents did not attend high school we still felt that it would be interesting to see how much venereal disease we could find in this school group. In order to simplify follow-up work we attempted to secure a list of all the sexual contacts from the pupils in advance of evidence of ill-

ness, since we felt the incidence of venereal disease would be high. To this end, all pupils were interviewed by a physician or nurse of their own sex and confidence was established so that such contacts were obtained as well as the usual venereal disease laboratory tests. Our results were at first unproductive. True, we elicited much evidence of promiscuity, but only 4 per cent had a venereal disease despite the fact that the Negro draftee incidence rate was 20 to 25 per cent. However, our efforts were soon to be rewarded. Impressed by the interest, personal attention, and knowledge they had received, these pupils became the health missionaries in their community. Soon many other young Negroes came to us for similar conferences. In all, over a dozen infectious cases of venereal disease were found and placed under treatment. The misinformation on sex hygiene which was apparent was turned over to a state supervising teacher who made plans to correct these errors by both organized and individual instruction. What began as a school survey turned into a community project for health education, a program of the greatest importance to all citizens in the area.

This is an instance where a routine health department service contributed to an educational program and pointed out the need for additional steps in school health education. It demonstrated that the health officer, who knows the health facts in his area and controls community health resources, may frequently indicate the need for specific school health programs, which in turn play their part in securing worth-while community health activity.

C. Student Assistance at Clinics—We need no longer look on the school itself as the boundary of learning. Health department clinics, the county tuberculosis hospital, the local health council, the health department office, and the voluntary health agencies are all work-

ing laboratories for health education. We have arranged for high school students to assist with tuberculosis and child health clinics. Each session was followed by a conference where students discussed their observations and gave us the opportunity to stress the major health principles involved.³ Student assistance is an invaluable experience; the "learn through doing" principle is put into practice and youngsters may learn through concrete, purposeful activity which is far more meaningful than the textbook lesson. Such student help should not be looked upon merely as a youngster's contribution to community health, the health officer in turn must be available to answer questions, teach and lead discussions. Here is an unlimited opportunity to teach children to differentiate between good and bad health information—to lead them toward a lifetime habit of seeking approved sources for facts about health. If he can learn about his community health agencies, if he can understand what they are accomplishing, he will be in a better position to utilize their available health facilities for himself, and at the same time, he will recognize the need for supporting such activities.

D. Leadership Training Institutes—Frequently, the health officer may find ways of working through classroom routines to improve school health. In one county, we carried out health institutes^{3, 4} aimed at giving the parents and teachers the facts they needed to bring them up to date on the latest developments in the health field. Each session of these leadership training programs was preceded by several short talks given by members of the group regarding the utilization in their own schools and communities of the material covered during the preceding month. This resulted in better integration of health with other teaching and a greater appreciation of the common defects of school children and the need for their

correction. Where defect correction programs exist the teacher can be a potent force through her frequent contact with parents and the fact that she is in a position to see that poor academic work is often closely related to defects.

One of the high school principals in this same county participated in the U. S. Public Health Service malaria-training institute which was held in Memphis. Upon his return, he made his newly gained knowledge available to many of the schools and aided in setting up worth-while community projects in draining, oiling and spraying which became part of the intramural and extramural duties of the school children. These projects were of greater value to the practical teaching of malaria control than the preceding years of classroom recitation.

E. A Coördinated School and Health Department Nutrition Program—In the region concerned, it was discovered that there existed a great need for education in nutrition. Although predominantly an agricultural area, staple crops were the rule and home gardens rare. Under the guidance of the central planning committee which included representatives of the health department, schools, and other community groups, successful attempts were made to secure corrective action.^{3, 4} Home economics teachers arranged nutrition displays and games, children at school prepared and ate the nutritious though unfamiliar foods. The lesson was carried into the home, as nutrition experts prepared foods for entire families of children who appeared malnourished and whose diets were lacking in essentials. Grocers reported increases in the sale of whole wheat products and community home canning reached amazing proportions. The health officer noted a marked increase in attendance of parents at school examinations and a greater willingness to cooperate in the correction of defects.

Successful efforts with parents of the school age child were shown to be of immediate advantage to both the younger and older members of the family. The infant and preschool clinic loads were raised, immunizations at earlier ages became more frequent and adult interest in health problems became more apparent as evidenced by their increased financial support of health department programs.

F. Health Education through a Corrective Program—As you know, the health officer who works in upstate New York has a limited legal responsibility toward school health education. We have already stressed the fact that this should in no way influence his moral responsibility in this direction. At present, part of our county is acting as a control for the ten year fluorine dental caries preventive study.^{5, 6} Fluorine is being added to a total of one part per million to the water supply in an adjoining city, while the children of one of our own cities are being used as controls. Data collected by this state health department survey have revealed that even in an economically satisfactory area 58 per cent of the school children needing dental care have received none, 22 per cent have received only partial dental care, while a mere 20 per cent have obtained complete care. That this neglect of dental care is based on a poor understanding of its need has been proved in other areas, and appears to be our chief problem as well.^{7, 8} True, we can and did point out this fact repeatedly to school authorities who promised to step up the pace of dental health education. But in dental care the best educational response will follow in an active demonstration—a maxim already proved through our own efforts in the preschool dental program. Since the school authorities were unable to meet this need, the health department is coördinating the community resources to initiate action. Coöperating

dentists have been secured in one area which will serve as a demonstration project. The departmental dental hygienist was offered to the school on a part-time basis. Our health educator will assist in emphasizing the scientific facts involved. The Parent Teachers Association will help with arrangements and the local public health nursing committee will see that the results are brought to the attention of the community. But primarily, the program in itself will be valuable school health education. It will lead schools to break away from the old plan of giving care largely to the poorest children with the worst teeth—a never-ending process. We now expect to take each new beginning class, give the children complete dental care and follow through with continued care as they progress onward through the primary grades. The goal toward which we are striving is an entire school with perfect teeth. Such a program should prove more valuable to the dental health education of the county than all the years of hit-and-miss correction which have preceded this plan recommended by the American Dental Society.^{9, 10} Put into effect through the initiative of the health department and the co-operation of many local agencies, this project should lead to positive action on the part of parents and children toward voluntary correction of dental defects.

Conclusion

Energetic health officers are never satisfied with the health progress in their community. How well are community resources being utilized in the school program? With few exceptions the reply has been discouraging. But recognition of need is the first step toward positive action. In many health departments, health educators have been added to the staff to serve as liaison personnel between education and health. School administrators are realizing the untapped community resources avail-

able for teaching. At the state level, coöperation between the departments of health, education, mental hygiene, and social welfare is becoming more apparent as evidenced by the recent recommendations of a newly organized interdepartmental council in New York State.¹¹

All of us have realized that health education is our prime weapon for bridging the gap between health practice and available health facilities. Health departments are providing the facilities; their communities contain the laboratories for health demonstration. It is up to the health officers and school administrators to accept the challenge and employ these facilities to their fullest extent in a school health program. Let us deëmphasize the specific campaign as an instrument of health education in favor of a continuous, organized, and coöperative program for all ages. In this work the schools must play a prominent role.

Presence of Neutralizing Antibodies of Newcastle Disease Virus in Human Sera

BEATRICE F. HOWITT, F.A.P.H.A., LINDSAY K. BISHOP,
M.D., AND ROBERT E. KISSLING, D.V.M.

*Bacteriologist; S.A. Surgeon; and Pathologist (Animal), U. S. Public Health
Service, Communicable Disease Center, Virus Branch and Laboratory
Division, Montgomery, Ala.*

IN 1926 a highly infectious and fatal disease of fowls was first recognized in the Dutch East Indies by Kraneveld,¹ and also by Doyle at Newcastle-on-Tyne, England. In 1927 Doyle² isolated a filter-passing agent that he designated as Newcastle disease virus (NDV). Similar outbreaks among poultry were soon described from various parts of the world with the exception of the United States. It was not until 1941 that Beach³ and in 1942 Stover⁴ both recognized a respiratory central nervous system disorder of chickens in California that became known as avian pneumoencephalitis.⁵ By means of the serum neutralization test Beach⁶ in 1944 established the serological similarity of this strain with that of the British Newcastle disease, and in the following year the same virus was recovered from fowls in a series of outbreaks in the eastern United States.⁷ Systematic surveys during the past three years have demonstrated the presence of the disease, either by virus isolations or serum neutralization tests, in all but four states in this country.⁸ Therefore it has become of major importance to poultrymen throughout the United States as well as other parts of the world. Beaudette⁹ has ably reviewed the literature on Newcastle disease

through 1943, while Brandly, *et al.*⁷ have summarized the more recent epidemiology of this poultry disorder.

Burnet and Ferry¹⁰ in 1934 were the first to propagate NDV in the embryonated hen's egg but it was not until 1942 that Burnet¹¹ demonstrated its ability to agglutinate chicken red-blood cells and thus place it with the respiratory group of viruses, such as influenza and mumps. The NDV has long been considered of primary importance for birds, yet in 1947 Reagan and coworkers¹² demonstrated its adaptability to certain mammalian tissues. They were able to make serial passages in the Syrian hamster¹³ and likewise infect a rhesus monkey¹⁴ by the intracerebral but not by the intranasal route. Mice, guinea pigs, and rabbits were relatively insusceptible.

Although much has been written about Newcastle disease in poultry, only four reports in the literature mention invasion of human tissues. All of these cases are concerned with eye manifestations. Burnet in 1943¹⁵ described a laboratory infection in Australia due to accidental entrance of live virus into the eye, followed by a conjunctivitis, headache, chills, and general discomfort. Newcastle disease virus was recovered from the conjunctival fluid and antibodies for

the latter were present in the patient's serum. In 1946 Anderson¹⁶ reported two other laboratory infections in Australia. Both patients developed conjunctivitis and NDV was isolated from the tears.

In 1946 Shimkin¹⁷ recorded a case of conjunctival hemorrhage in a worker at the Governmental Poultry Laboratory in Palestine. In the same year Yatom¹⁸ described a small epidemic of NDV infection among kitchen workers handling poultry in the Agricultural School, Mikveh-Israel, where an outbreak had recently occurred among the fowls. Seventeen people developed a conjunctivitis which disappeared in 10-14 days.

Although NDV was first recognized in California about 1941, it was not reported for the eastern states until 1944 and 1945⁷ which time would roughly correspond to the appearance of certain atypical human cases in Tennessee. The disease in fowls spread rapidly over the country after the first recognition, but was not recorded in Alabama and Tennessee until 1947,²³ although it may have been present earlier in an inapparent form. It was in 1948 and perhaps in late 1947 that infections in human beings in Alabama were found.

Except for these reported eye manifestations there has been no mention of any particular association between this disease in fowls and human infection among the general population. It is the purpose of this report to describe the accumulated evidence leading one to consider that the poultry disease has become of significance to man in the United States and that the human manifestations follow very closely those described for the avian disease; either respiratory or neurological symptoms, or a combination of both. Most of the evidence has been based largely on the results of serum neutralization tests because, so far, the virus has not been recovered from any human tissues. The

facts on which these considerations are based have developed in the following manner.

NEUTRALIZATION TESTS ON THE SERA FROM TENNESSEE

For several years outbreaks of a mild central nervous system infection have been occurring among children in middle Tennessee and have been associated with an influenza-like disorder in adults. There have been no fatalities. Serum neutralization tests had repeatedly been negative for viruses of the recognized summer encephalitides. In the milder cases, there was usually a sudden onset with fever, headache, malaise, occasional chilly sensations, and complete recovery in 24 to 48 hours. In other instances there was evidence of meningeal irritation with stiff neck and back and occasionally nausea and vomiting. Even in the more severe cases the temperature elevation rarely persisted for more than three days, and the duration of illness for more than five days.

Through the courtesy of Dr. Amos Christie and of Dr. J. C. Peterson* of the Department of Pediatrics at Vanderbilt Hospital, sera from many of their patients were sent to the U. S. Public Health Service Virus Laboratory at Montgomery, Ala. Collections were likewise made by members of the Virus Branch of the U.S.P.H.S., Epidemiology Division. All neutralization tests made with these sera were negative for the viruses of eastern and western equine encephalomyelitis and St. Louis encephalitis. Fecal specimens from a few of the cases when inoculated into monkeys were likewise negative for the virus of poliomyelitis. Because of both the negative serology and the repeated association of the cases with chickens on the premises, it was thought of interest to try the serum neutralization tests

* The clinical histories of these patients will be reported later.

against the virus of Newcastle disease which had now become of such widespread importance to poultry raisers in this country. This thought was further strengthened by the finding of sick chickens in the yard of one of the patients who had manifested the milder clinical symptoms. The two birds were obtained and showed not only the clinical manifestations of Newcastle disease but the characteristic gross lesions at autopsy. No virus was recovered from the tissues when inoculated into embryonated eggs, but the blood sera from both birds contained antibodies for NDV.

a. Methods

Through the courtesy of Dr. L. T. Giltner of the Bureau of Animal Industry, the California strain of pneumoencephalitis (Newcastle disease virus) was received and by permission of the B.A.I., it has been used for performance of the serum neutralization test in embryonated eggs. The technique employed has been essentially the same as recommended by the B.A.I.¹⁹ for the identification of antibodies in poultry sera, except that the method of virus dilution follows the standard recommended for neurotropic viruses in the U. S. Army *Laboratory Manual*.²⁰ By this method the undiluted serum is added in equivalent amounts to different tenfold dilutions of virus beginning with 1-5 and thus becoming 10^{-1} , 10^{-2} , 10^{-3} , etc. The LD₅₀ end point is obtained according to the method of Reed and Muench.²¹ If the virus titer is found in each test, then the neutralization index can be estimated. The result is considered negative if the index is under 10, equivocal if between 11 and 49 and positive if over 50.

In the present study the tests were performed in the following manner: Ten day old embryonated hen's eggs were inoculated into the allantoic cavity with 0.1 ml. of NDV and the allantoic fluids removed aseptically in 48 to 72

hours. The fluids with an LD₅₀ end point of at least $10^{-9.6}$ to $10^{-10.0}$ were then pooled, sealed in ampules, and stored in the dry ice refrigerator for future use. Sufficient virus was prepared to perform a large number of tests, thereby insuring a greater uniformity of results. Standard positive serum was obtained from immunized rabbits.

The tests were performed by preparing serial tenfold dilutions of the virus in buffered saline containing 10 per cent normal rabbit serum and adding 0.3 ml. of undiluted serum to 0.3 ml. of each virus dilution. These dilutions were spaced within a range that would give positive results at one end and negative at the other, in order to determine the LD₅₀ virus end point. The resulting mixtures were shaken and placed in the incubator at 37° C. for ½ hour and then removed to the cold room at 9-10° C. for another ½ hour. Ten day old embryonated eggs were inoculated with 0.1 ml. of each dilution into the allantoic fluid. As a rule, 4 eggs were used for each dilution. The inoculated eggs were then kept at 37° C. and candled every day for viability. A known positive serum was included with each test. The virus was titrated through 10^{-10} and an equal amount of 10 per cent normal rabbit serum in buffered saline was added to each dilution. In the absence of protection, the embryos usually died in 3 to 4 days. All live eggs were kept under observation for 6 days before they were discarded. The eggs with embryos that died within 24 hours were not included in the final computations. Any that died irregularly or out of the proper sequence were opened and the allantoic fluid was tested for virus by the hema-agglutination test. If there was sufficient material, the tests were repeated on all equivocal sera. Whenever possible an effort was made to obtain both acute and convalescent blood from each patient so as to compare any change in titer.

b. *Results of the neutralization tests*

The results of the neutralization tests on the sera obtained from children in Tennessee during 1947 and the early part of 1948 are given in Tables 1 and 2. In Table 1 the cases are roughly previously used for testing against other viruses before work was initiated on NDV. One very severe case of encephalitis (No. 5) and one having poliomyelitis-like symptoms (No. 9) showed the presence of antibodies. All other cases

| Total for 1944-1945 | 89 | 0 | .. |

classified into three groups; those having (1) atypical illnesses showing what might be called the ND syndrome, (2) those having a definite or a severe encephalitis, and (3) those that did not fall into the other groups or from whom no histories were available. Table 2 summarizes the results of all the neutralization tests performed on the sera from Tennessee, including a large group kindly sent by Dr. J. C. Peterson from patients entering the Vanderbilt clinic during 1944 and 1945. Eleven of these children had encephalitis but the other 78 had come in because of dysentery, enteritis, tetanus immunization, or the like.

Of the 15 children placed in group 1 (ND syndrome), 80 per cent had antibodies for the Newcastle disease virus. Three sera, however, were only weakly positive. There were three instances (case Nos. 12, 14, and 28) in which the tests were negative on the first specimen but became positive on the second bleeding. It is unfortunate that many of the sera originally obtained had been

of encephalitis gave no protection against NDV including those seen in 1944-1945. The tests, however, were done on only one bleeding. All of the 78 sera kept since 1944 and 1945 were entirely negative for NDV antibodies.

NEUTRALIZATION TESTS ON THE SERA OF THE LABORATORY PERSONNEL

After receiving the NDV from the Bureau of Animal Industry early in December, 1947, work was started immediately for the performance of the neutralization test in eggs. No one in the laboratory, except perhaps one veterinarian, had had any previous known association with NDV. He had not been working with the virus itself.

On March 10, 1948, one of the laboratory staff (R.G.) developed an influenza-like illness mainly characterized by severe headache, pain in the chest, and general malaise. She remained home for several days and soon recovered. Blood was taken several weeks later. She had not been working with NDV but her serum protected against

TABLE 3

the virus as shown in Table 3. There were no antibodies for influenza A and B viruses.

On March 18, 1948, one of the technicians (J.A.) who had been working with NDV complained of aches and pains and a feeling of malaise. She was at work for two days, then remained at home because of nausea, vomiting, fever, headache, and general weakness. This occurred over the week end and as no one realized her condition, she was not seen by the Medical Officer until Monday. Blood was taken and it was thought that she might have an influenza-like illness. Her temperature had become normal by March 26 and her condition rapidly improved, although the weakness persisted for two more days. Because she had been associated with the NDV her serum was tested for neutralizing antibodies against this strain. Anti-hema-agglutination tests were also run against the viruses of influenza A and B. The results were negative for the latter strains but positive for NDV. Blood was removed at successive intervals and the neutralization tests were progressively more positive as shown in Table 3.

Two more members of the laboratory personnel (P.W. and R.K.) developed milder but similar illnesses in March, while in May two additional people became ill with more pronounced symptoms (U.B. and R.F.). Sera from all of them contained neutralizing antibodies against NDV (Table 3) in high titer. After obtaining these first positive results, blood was removed from many of the laboratory workers. Likewise, it was fortunate that sera had been taken during the summer of 1947 from a large group of staff members, many of whom, however, had already left the laboratory.

The results of the neutralization test on sera of the staff taken both in 1947 and 1948 are summarized in Table 4. All tests were negative on the bleedings of 1947, while they were all positive on the sera of the group showing symptoms in 1948. Of the 11 people without symptoms 4 had definite antibodies against NDV. Two of these individuals had been inoculating eggs with NDV, while the other two had no direct contact with the virus but only contact with the staff members who had been sick.

Neutralization tests were done also

TABLE 4

on the sera of 3 other persons, two of whom were clerical workers at the laboratory and the third the wife of one of them. These tests were not included with the others, because all three individuals had developed the same clinical symptoms of headache, fever, and general malaise before they arrived at the laboratory. Two had this illness in Atlanta, Ga., in February, 1948, and the third had similar symptoms during the last of August, 1947, before joining the laboratory staff. Unfortunately there were no early blood specimens from these people, but the results on the later sera were all strongly positive for NDV. It seemed evident that the development of these antibodies in the sera of the married couple must have occurred prior to residence at the laboratory because the blood was removed from the husband on arrival and the wife had no contact with the place. Likewise the third person, and also her husband, had been quite ill with similar symptoms before there was any connection with the laboratory.

From the results of the serum neutralization tests, it seems apparent that this febrile influenza-like illness had developed among the staff subsequent to the advent of the virus in the laboratory. One of the 6 persons with symptoms had worked with NDV, while four of the others were together in the same room. On the other hand, a similar type of disorder had been occurring throughout Montgomery for several months and these people may have acquired their infection from an outside

source. It is to be regretted that no virus was recovered from any of the laboratory personnel. Most of the individuals either had a transient illness that was not reported at the time or else became ill before the significance of obtaining material was recognized.

NEUTRALIZATION TESTS ON OTHER SERA FROM ALABAMA

Coincidental with the appearance of these illnesses among the laboratory personnel, a case of illness in a child was seen by one of us (L.K.B.) during April, 1948, in consultation with Dr. T. C. Marrs of Montgomery, Ala. The boy became acutely ill with symptoms similar to those mentioned for the children in Tennessee. There was early evidence of neurotropic disturbance with later recovery. Through the courtesy of Dr. Marrs, throat washings and both acute and convalescent blood were obtained from the child. The neutralization index for NDV was 21.4 for the early serum but rose to 17,800 for the sample taken 17 days later. No virus was isolated from the throat washings which had been treated with antibiotics and inoculated into hamsters and embryonated eggs. Because there had been association with chickens prior to his illness, blood was withdrawn from 12 of this flock. No antibodies for NDV were found in their sera.

Later in June, through the courtesy of Dr. D. G. Gill, the State Health Director of Alabama, Dr. L. R. Worcester of the State Health Department and U. S. Public Health Service, and Dr.

J. T. Grimes, the attending physician, blood, feces, and throat washings were obtained from a group of 8 children and 1 adult in a rural town of southeastern Alabama. All of the patients had poliomyelitis-like symptoms; headache, fever, vomiting, and certain neurological signs, but no residual paralysis. The fecal material was treated with antibiotics and inoculated into monkeys, hamsters, and eggs, while the treated throat washings were injected only into the two latter hosts. The virus of poliomyelitis was not isolated from the fecal specimens nor was any other virus obtained from the eggs or hamsters. The neutralization tests, however, were definitely positive against NDV on the sera of 7 children and equivocal on the other two patients. The results on a later bleeding have not yet been obtained. Because most of the cases had some previous association with chickens, blood was taken from poultry found on the premises of several patients. Of the 9 sera examined 5 have shown antibodies for NDV. Although the work in regard to this outbreak is still incomplete, and even though no virus has been found, there seems to be sufficient evidence from the results of the serum neutralization tests to indicate an association with Newcastle disease virus.

CONTROL DATA

Neutralization tests were negative on the sera of 97 children and adults who did not have these symptoms and from 19 of the laboratory personnel taken before working with this virus.

DISCUSSION

From the gradually increasing evidence, it is apparent that during the past 3 or 4 years a hitherto undifferentiated disease entity is beginning to be recognized, particularly in communities of the South. Because children are often affected and manifest certain poliomyelitis-like symptoms, the disease is often

reported as poliomyelitis. On the other hand, some cases may show pronounced meningeal irritations and be called meningitis. Still others may have pneumonitis complications. Although the clinical symptoms may not be quite uniform and may vary according to the individual physician's interpretation, yet in general all cases agree in showing a sudden onset, abrupt febrile course and rapid recovery without paralysis or other sequelae. An outbreak of this type, recognized as a meningo-encephalitis, was reported in 1947 by Humbert, Tucker, Mosley, and Bishop²² for Giles County, Tennessee. About 209 children and adults were seen with this acute disease, probably of viral nature, which usually lasted from 24 to 48 hours, although the fever, headache, and malaise might continue for 5 to 10 days. There were no fatalities.

Although conclusive proof is lacking without isolation of a virus, yet the results of the serum neutralization tests suggest that the virus of pneumo-encephalitis (Newcastle disease) of fowls is the etiological agent responsible for this varied syndrome. With exception of the people in the laboratory group, most of the cases from Tennessee and Alabama were associated with chickens. Chickens showing ND symptoms were found on the premises of one patient in Tennessee, while the sera of others in Alabama had positive neutralizing antibodies for this virus. The dates of recognition of NDV in fowls in these two states roughly coincide with those for the atypical human cases.

The disease of fowls is usually characterized by neurological symptoms in the immature birds, while respiratory manifestations predominate in the adults. A similar tendency has been observed in the human cases described; a relatively mild course, with meningeal or neurological symptoms more pronounced in children, more influenza-like manifestations in adults.

The data presented in this paper suggest that the virus originating with the fowl has subsequently spread to man, so that now in many instances it may be transmitted from man to man as well as from fowl to man. Poultrymen have long recognized the air-borne transmission of the virus, but it is only recently that DeLay, DeOme, and Bankowski,²⁴ by means of a special apparatus, have recovered NDV from the air of poultry houses containing infected birds. Because NDV is both air-borne and quite resistant to adverse conditions,²⁵ one could readily explain a rapid dissemination from fowl to man.

SUMMARY

1. Sera were received in 1947 and 1948 from various groups of children in Alabama and Tennessee suffering from a mild central nervous system infection of short duration and without sequelae. Because of the frequent association with chickens and the absence of antibodies for the common neurotropic viruses, serum neutralization tests were done against the virus of pneumoencephalitis (Newcastle disease) of fowl.

2. Of 15 sera from children in Tennessee with the ND syndrome 12 were positive to NDV. One case of encephalitis and one with poliomyelitis-like symptoms had antibodies for this virus, but all other sera were negative, including 78 that were taken from children in 1944-1945 without this atypical syndrome. Two chickens from the premises of one of the patients showed both the pathological lesions of Newcastle disease and the presence of neutralizing antibodies in the blood.

3. Of 10 sera from human beings in rural Alabama showing this mild central nervous system syndrome, 8 had definite neutralizing antibodies for NDV, while 2 were equivocal. Chickens with NDV antibodies were in association with several cases.

4. Subsequent to starting work with the virus in the laboratory, an acute influenza-like infection developed in 6 of the laboratory personnel. Antibodies in high titer against NDV were found in the sera of these 6 persons. Antibodies were also found in 4 out of 11 sera of laboratory personnel without symptoms. The sera taken from 19 people in 1947, before working with the virus, were negative for NDV antibodies. The blood of 3 individuals who had typical symptoms be-

fore association with the laboratory contained definite neutralizing antibodies for NDV.

5. All neutralization tests for NDV were negative on the sera of 97 children and adults who had not shown these atypical neurological symptoms.

6. Although no virus has been isolated, it seems probable from the evidence presented that the Newcastle disease virus of fowls is the agent responsible for many of the atypical central nervous system infections that have been reported in man during the past few years, and that, as in the fowl, the manifestations are neurological in young individuals and influenza-like in the adult.

7. It is suggested that NDV originating with the fowls has probably spread to man and that in many instances there is a man to man rather than a fowl to man dissemination.

ACKNOWLEDGMENTS: The authors gratefully acknowledge the interest and coöperation of Dr. Amos Christie and Dr. J. C. Peterson of the Department of Pediatrics of Vanderbilt University School of Medicine, and of Dr. C. B. Tucker, State Epidemiologist of the Tennessee State Health Department. Acknowledgments are likewise made to Dr. D. G. Gill, State Health Director of Alabama, to Dr. R. L. Worcester of the Alabama State Health Department and the U. S. Public Health Service, to Dr. J. T. Grimes and Dr. J. S. Du Bois of Enterprise, Ala., and to Dr. T. C. Marrs of Montgomery, Ala., for their interest and coöperation in the collection of material from different cases. We are also indebted to the laboratory personnel of the U. S. Public Health Service, Virus Laboratory at Montgomery, Ala., for allowing blood to be taken in the interest of this investigation.

Alaska Expands Its Public Health Program

C. Earl Albrecht, M.D., Commissioner of Health of the Territorial Department of Health, Juneau, Alaska, has announced that the budget for the Territorial Department of Health has now been fixed for fiscal 1949 in the amount of \$1,115,000.

Dr. Albrecht reports that Congress appropriated funds to expand the public health program in Alaska in all fields. An item of \$250,000 has been set aside for research. A sum of about \$6,000,000 has been set aside by Congress for the building of a second sanatorium in

the area near Anchorage, besides funds which were made available for at least 4 custodial units for the treatment of tuberculosis in isolated areas.

The Motorship Hygiene has been officially transferred from the U. S. Army to the Territory by an Act of Congress.

Dr. Albrecht has announced that a considerable number of vacancies in professional staff at good salaries now exist, and that information concerning the vacancies may be obtained from the office of the Territorial Department of Health in Juneau.

THE CHILD GUIDANCE CLINIC

IT is probable that nearly every reader of this *Journal* knows what clinics for tuberculosis and venereal diseases are in operation in his locality, what organization directs them, and what services they render. We suspect that not all of our readers could pass an information test on the child guidance clinics which are available in the same areas. This is why we have asked Dr. Frederick H. Allen to prepare for this issue a brief review of the developments of child psychiatry in the United States.

The National Tuberculosis Association was founded in 1904, the National Committee for Mental Hygiene in 1909. The first of these fields has developed to an astonishing degree, while in respect to mental hygiene, we are just beginning to translate talk into action. The National Committee for Mental Hygiene told us in its last *Annual Report* that there were only 50,000 children served by guidance clinics in the United States while five times that number needed such assistance. The cost of clinic services of this type is considerable, since the procedures involved must, of necessity, be intensive and long-continued. In one New England city, recently studied by the writer, the cost of such a clinic was \$66 a year for each child under treatment. The lack of personnel, as Dr. Allen points out, is an even more serious handicap than the lack of funds.

Somehow, the obstacles to progress in this field must be overcome. We must not forget that mental and emotional maladjustment is almost as serious in its results as all other kinds of diseases and disability taken together; that adequate emotional adjustment attained in childhood will frequently establish a balance making all the difference between success and failure in after life; and that the ultimate saving in human efficiency attained by such adjustment compensates ten-fold or a hundred-fold for the cost involved. The National Mental Health Act opens the way to real progress in the provision of community services of this kind and in the preparation of personnel for such services.

What is your community doing to take advantage of these opportunities?

THE PROBLEM OF WHOOPING COUGH

THE figures cited below make it clear that pertussis has been less effectively controlled than any other of the acute communicable diseases of the United States.

| | Deaths per 100,000 | | Per cent Reduction |
|----------------|--------------------|------|--------------------|
| | 1900 | 1940 | |
| Diphtheria | 40.3 | 1.1 | 98 |
| Typhoid Fever | 31.3 | 1.0 | 97 |
| Measles | 13.3 | 0.5 | 92 |
| Whooping Cough | 12.2 | 2.2 | 82 |
| Scarlet Fever | 9.6 | 0.5 | 95 |

Since 1940, the same trend has continued. During the three years, 1943-1945 the combined death rate from diphtheria, scarlet fever, and typhoid fever was slightly less than that from whooping cough alone. This disease causes approximately 2,000 deaths a year in the United States.

A recent article by Mudd and Felton¹ on specific means of controlling pertussis is therefore of interest to the health officer.

These authors make three major points. They advocate as an aid in diagnosis, the cultivation of the organism from suspected cases by the use of nasopharyngeal swabs, and cultivation on Bordet-Gengou blood agar with a drop of penicillin solution to inhibit interfering Gram-positive organisms. This procedure, devised by Bradford, is considered superior to the use of cough plates.

Secondly, they point out that the use of hyper-immune human serum (prepared from suitable donors, treated with repeated inoculations of *H. pertussis* vaccine) is of established value in treatment and in the passive immunization of exposed children. This procedure has been accepted by the Council on Pharmacy and Chemistry of the American Medical Association; and appears superior to use of the rabbit sera provided by certain commercial firms. It is concluded that "human hyperimmune serum or globulin should be used in treatment of all infants who are seriously ill with whooping cough."

Finally Mudd and Felton lay stress on the importance of active immunization by the use of standard pertussis vaccine. Since almost half of all deaths from whooping cough occur within the first six months of life, vaccination should be performed early to be effective. With older children, the use of pertussis agglutininogen as a skin test for susceptibility is suggested, although its value is still in the stage of clinical trial. Studies on over a thousand individuals have shown only 1 per cent positive reactions in infants with no known clinical history; 82 per cent in children with a history of whooping cough; 84 per cent in vaccinated children; and 100 per cent in adult immunized blood donors.

An important contribution by J. A. Bell² has recently called attention to the value of an alum-precipitated mixture of pertussis vaccine and diphtheria toxoid for the simultaneous control of both the diseases concerned.

GALILEO WAS RIGHT

IN the fall of 1932, the Committee on the Costs of Medical Care presented its *Final Report* which included the two following major recommendations:

"I. The Committee recommends that medical service, both preventive and therapeutic, should be furnished largely by organized groups of physicians, dentists, nurses, pharmacists and other associated personnel. Such groups should be organized, preferably around a hospital, for rendering complete home, office, and hospital care. The form of organization should encourage the maintenance of high standards and the development or preservation of a personal relation between patient and physician."

"III. The Committee recommends that the costs of medical care be placed on a group payment basis, through the use of insurance, through the use of taxation, or through the use of both these methods. This is not meant to preclude the continuation of medical service provided on an individual fee basis for those who prefer the present method. Cash benefits, i.e., compensation for wage-loss due to illness, if and when provided, should be separate and distinct from medical services."

A group of 8 physicians and 1 clergyman, who were members of the Committee, presented a minority report, dissenting from these conclusions; and recommended only two practical measures for the wider provision of medical care, the expansion of government care of the indigent, and the development by state or county medical societies of plans for medical care.

The Journal of the American Medical Association, on December 3, 1932, compared the Committee report and the minority report and concluded that "The alignment is clear—on the one side the forces representing the great foundations, public health officialdom, social theory—even socialism and communism—inciting to revolution; on the other side, the organized medical profession of this country."

So much for 1932; now for 1948. At the request of a Senate Committee, the Brookings Institution of Washington presented a report last winter on *The Issue of Compulsory Health Insurance*. This report concludes that "The experience of the United States since 1932 seems to have demonstrated the wisdom of these recommendations of the majority of the members of the Committee on the Costs of Medical Care. It would seem unwise at this time to substitute for these developments a system of compulsory health insurance by national law which would have the unfortunate tendency to freeze policies and eventually retard medical progress."

Galileo was right. The world *does* move.

The quotation of the Brookings report with apparent approval in the *Journal of The American Medical Association* for June 5, 1948, and the attitude taken by the A.M.A. representatives at the recent meetings of the National Health Assembly seem to indicate that the Association has now moved on to almost the exact position taken by the Committee on the Costs of Medical Care, 16 years ago. What was "socialism and communism—inciting to revolution" is now accepted doctrine in the minds of such a highly conservative group as the Brookings Institution and appears acceptable to the *Journal of the American Medical Association*.

Public opinion necessarily moves slowly; but the ground gained in coöperative thinking is most encouraging. The fact that a successful program of medical care must be based on the broad principles of group practice and group payment is now generally accepted. The interval between the most extreme conservative thought and the most progressive thought on this matter has narrowed down to two—and only two—major issues. Shall prepayment be "compulsory" or "voluntary"? Shall compulsory plans be on a state-wide or on a national basis?

It will be recalled that the Committee on the Costs of Medical Care did not—

in 1932—recommend compulsory sickness insurance because its members believed that further experimentation with group practice was first desirable, although they did say that “such a step may ultimately be necessary and desirable in some states.” It is of interest to note that Dr. Haven Emerson and four other members of the C.C.M.C. dissented from the Committee’s emphasis on voluntary insurance as the basis for experimentation in 1932 and said: “We feel that the report should not emphasize or recommend voluntary health insurance over required health insurance, or vice versa, but that both plans or a combination of the two be equally recommended by the Committee for experimentation.” Today there are many other students in this field who would assent to such a proposition, since experience during sixteen years has greatly increased the knowledge at our disposal.

The term “compulsory” is a somewhat unfortunate one, since it has been used to imply that the medical profession would be “compelled” to do something, which is, of course, not the case. “Compulsion” applies to payments by employees (who ardently desire such a plan) and to employers (who have not opposed it). The real essence of such a program is that it is *contributory*; and that contributions come from the employer as well as the employee. This is the only way (short of universal state medical service, which no substantial group advocates in the United States) by which the family of moderate income, but above the level of indigence, can be provided with the medical care which it needs. The Health Insurance Plan of Greater New York most ingeniously provides service which is supported on a “contributory” but not a “compulsory” basis. Whether such a program could be used in other areas is doubtful but worth exploration. On a geographical basis, it is quite possible that the more economically fortunate states could develop compulsory plans such as that urged by Governor Warren in California. It seems certain that the less prosperous states could not.

It is heartening that the area of controversy has been limited by sixteen years of discussion to the two concrete issues cited above. We trust they may be considered in the light of factual data and the results of such experiments as the New York Health Insurance Plan, with avoidance of emotional propaganda and with that reverence for the truth which should be the conscience of the scientist.

LETTERS TO THE EDITOR

TO THE EDITOR:

I have read with interest the article by Justin Andrews, beginning on page 931 of your July issue. It is with much regret that I note he failed to give any credit to, or even mention, the anti-malarial work done by the U. S. Army during the war period.

For your information, I would like to point out that during 1941, 1942, and 1943, the following was *part* of the anti-malarial work done by the Army under my general direction in and around our camps in the Continental United States:

| | |
|---------------------------|-------------------|
| Oil and larvicide applied | 4,250,000 gals. |
| Paris green applied | 165,000 lbs. |
| Ditches dug | 1,356 miles |
| Fill placed | 5,480,000 cu.yds. |

This does not include minor work, as ditch cleaning, ditch lining, etc. Nor does it include work done in 1944 and 1945, for which the figures are not immediately available to me. The data seem sufficient, however, to show that the work the Army did was sufficiently large to be a factor in the results shown in the chart on p. 936, which chart, incidentally, was prepared originally in my office.

W. A. HARDENBERGH
Pres. & Editor
Public Works Magazine
New York, N. Y.

July 14, 1948.

TO THE EDITOR:

I was much interested in the excellent editorial "The Science and Art of Health Administration" in the July, 1948 (Vol. 38, No. 7, p. 1008-9), issue of the *American Journal of Public Health*, as it expressed a view which I have long held.

As long ago as 1928 our Association became interested in the subject and in January, 1933, a Study was published by the Bureau of Educational Research, Ohio State University, entitled "The Duties of Ohio Health Commissioners." This Study was made by W. W. Charters, then Director of the Bureau, and Darwin A. Hindman.

I am sending you a copy of this Study

since it may contain some of the pertinent facts relating to the subject of the editorial. You may have seen it before but if not I trust you will find the Study of interest.*

ROBERT G. PATERSON
Director of Research
Ohio Tuberculosis and Health Association

July 20, 1948

* EDITOR'S NOTE: The document referred to by Dr. Paterson is an admirable pioneer study of exactly the problem presented editorially in our July issue. We strongly recommend it to our Health Officer readers and to faculties of Schools of Public Health.

Credit Lines

WHEN A CITY SPREADS BEYOND ITS BORDERS

In the July *Journal* (p. 986) Leonard M. Board and Herbert T. Dunsmore discussed some of the environmental health problems of what they call urban decentralization. Their paper, read at the American Public Health Association 75th Annual Meeting in Atlantic City, grew out of a study of Flint, Mich., made under the auspices of the Social Science Research Project of the University of Michigan. This study posed many of the problems that arise out of the hit-or-miss organization of local government in the United States, dating back to the days of sparse population settlements and what are now primitive forms of transportation.

The same problem, as related to Flint, is discussed in the April *Public Management* in an article, "Governmental Problems of Fringe Areas," by Victor Roterus and I. Harding Hughes, Jr., who were on the staff of the Social Science Research Project.

"When municipalities reach the stage of encirclement by a ring of incorporated satellites," say the authors, "no united action takes place on crime, health, planning, and other problems." Among a number of corrective actions suggested is annexation of fringe areas. That this is being increasingly done is indicated by a news item in the May *Public Management* reporting that 170 cities with populations of 10,000 or more made annexations of land area in 1947. The number annexing one-half square mile or more of land rose from 22 in 1945 to 30 in 1946 and 53 in 1947. April *Public Management* also reports on annexations in the San Francisco Bay area in an article by John C. Bollens on "Elements of Successful Annexations."

In Colorado Springs there is a movement on foot to annex new residential areas to the city proper before they incorporate as separate municipalities. Taking one such area of 3,000 population as an example, the city manager pointed out that the annual cost of supplying municipal services by Colorado Springs would be only about half the cost it would be if the area were to be a separate city. The initial capital outlay would be about one-third less.

Another corrective possibility not mentioned by the authors is the consolidation of city and county governments. With respect to public health services this has been done by many cities and counties, among the most recent consolidations being Seattle and King County, Washington; Charleston and Kanawha County, West Virginia; Evansville and Vanderburgh County, Indiana, and Buffalo and Erie County, New York. The Colorado Springs Health Department is a city-county department and thus does not have the problems of the new fringe areas that are concerning the city council in other matters.

TUBERCULOSIS RIDES WITH POVERTY

It has long been accepted that the solution of mass problems of tuberculosis control is in the foreseeable future. What still remains further from solution is the harder part, namely, focusing attention on the individual patient as a personality in a social environment, and making that social environment contribute to healthful living. *Life, Death, and Tuberculosis As Affected by Standard of Living* by Bailey B. Burritt is another chain in the evidence that tuberculosis is now at least as much a socio-economic as a medical problem.

Recently retired as Director of the

National Health Council, to which he was called for a year's special service after retiring from the General Directorship of the Community Service Society of New York, the author had long experience in dealing with the home problems of individuals and families in both the health and social fields. He says "The maintenance of a suitable standard of living means a great difference as to whether individuals and families will or will not acquire tuberculosis, and for those who may already have acquired this disease, it means a great difference in the chance of recovery and in preventing them from being the means of the development of new cases."

Then, in a brief attractive booklet, the author brings together significant and dramatic samples of the evidence linking tuberculosis and standard of living. This link has long been known but it bears frequent repetition because the knowledge is still far from perfectly acted upon.

Available from State Committee on Tuberculosis and Public Health, State Charities Aid Association, New York 28, N. Y., 5 cents.

HOUSING NEEDS MADE VIVID

A Housing Program for Now and Later makes the housing problem as real as the human beings who live in houses, or what often currently pass for houses. "Housing right now is doubling up and sharing the bath and cooking over a hot plate—it is the fact that you would love your old parents a lot more if they didn't have to live with you in a crowded flat. It is one reason why the farmer's wife grows old before her time and his children go away to the city, where at least they won't have to thaw out the pump on zero mornings."

Published by the National Public Housing Conference (1015 Fifteenth St., N.W., Washington 5, D.C.), under the editorship of Catherine Bauer,

Chairman of a Joint Committee of the National Association of Housing Officials and the National Public Housing Conference, it should be in the hands of every public health worker and also of everyone who thinks, with Representative Wolcott, that the public housing feature of the Taft-Ellender-Wagner bill should be eliminated. Twenty-five cents.

VIRGINIA HEALTH BULLETIN BACK ON THE SCENE

In May, 1948, appeared No. 1 of Vol. 11 of the *Health Bulletin* of the Virginia Department of Health. This had ceased publication with Vol. 10 in 1946. The new version is sprightly and attractively packaged. It starts with a "Know Your Health Department" article, gives some highlights of 1947, the 75th anniversary year of the State Board of Health, and has a "Did You Know That?" column which has a number of effective health education capsules. "Control of disease is not possible without the effective participation of Virginia's citizens" and "Write and tell us your reaction to the Bulletin" are two quotes that might be used elsewhere.

The present Virginia State Health Commissioner is Lonsdale J. Roper, M.D., who was appointed on August 7, 1946.

CARE OF ALCOHOLICS PAYS FOR ITSELF

In January, Welfare Commissioner A. E. Rose of Chicago reported on the first 6 months of operation of Portal House, Chicago's Treatment Center for Alcoholics. Patients are admitted to Portal House only if destitute and in need of public assistance. Of 102 admitted during 6 months all but 6 moved off public assistance, which leads the commissioner to note that the rehabilitation program has already more than paid for itself in savings of tax funds.

Two-thirds of the 102 patients have responded to treatment; 45 now being

handled as "outpatients" and 21 undergoing the first stages of treatment within the institution. The remaining one-third, 36 patients, failed to respond to treatment.

GONORRHEA AND THE PRIVATE PHYSICIAN

The Department of Public Health of the City and County of San Francisco has published a *Special Venereal Disease Bulletin* for July, 1948, on "The Diagnosis and Treatment of Gonorrhea in Private Practice." The authors are J. C. Geiger, M.D., Director of Public Health, and Richard A. Koch, M.D., Chief of the Division of Venereal Disease Control.

This *Bulletin* points up the strategic place of the private practitioner in the modern day treatment of gonorrhea. It is presented in a simple but comprehensive manner and the physician who reads it will have access to the established methods of treatment adapted for office use.

STURDY OAK FROM SMALL ACORN

The State Charities Aid Association (105 E. 22nd St., New York, N.Y.) took note of its 75th birthday recently in an attractive pamphlet, *A Small but Resolute Acorn on its 75th Birthday*.

There is a brief story, with pictures, of its various activities, child placing, mental hygiene, tuberculosis and public health, legislation, fund raising, etc. The emphasis is on today's picture but in the process a good deal of illustrious history is reviewed.

Lighthearted imagination has gone into both illustrations and writing, making the report delightful rather than stuffy. A good illustration of the fact that age need not be solemn.

A LOOK AT THE RECORD

Statistics so often give comfort to the enemy. But Don Griswold, M.D., Consultant in Public Health, Mississippi

State Board of Health, has come up with some charts and figures whose significance is unmistakable. In a bar chart he relates the non-white maternal mortality to the percentage of patients admitted to antepartum nursing service.

In the full-time county health departments the higher the per cent admitted to antepartum nursing service the lower the maternal mortality. Where 80 per cent or more were so admitted the rate was 1.6 per 100,000, where fewer than 20 per cent the rate was 4.4, nearly three times as great. The correlation was almost uniform throughout. In counties with only part-time health services, where the number brought under care was not even known, the maternal mortality rate was 5.8.

This material was prepared for a film strip for general distribution.

SUMMARY OF MILK- AND WATER-BORNE DISEASE OUTBREAKS

A Summary of Disease Outbreaks from Water, Milk and Milk Products, Other Foods, and Undetermined Vehicles has been prepared by the Milk and Food Section of the Sanitary Engineering Division, U. S. Public Health Service, on the basis of reports submitted by state and municipal health departments. This summary gives the number of outbreaks, cases, and deaths reported as attributed to water, milk and milk products, other foods, and undetermined origins for the years 1938 to 1946 inclusive. Whereas a reduction of outbreaks, cases, and deaths is evident in those attributed to water and undetermined origin, those attributed to milk and milk products do not show any clear-cut trend. Those attributed to other foods indicate an increase, particularly in the number of outbreaks of illness.

Another report of the Milk and Food Section gives a summary of milk-borne disease outbreaks reported by state and local health authorities in the United

States for the years 1923 to 1946 inclusive. The diseases listed are typhoid, paratyphoid, scarlet fever and septic sore throat, diphtheria, dysentery, food poisoning and gastroenteritis, and undulant fever.

LABOR TO OPERATE A HOSPITAL COÖPERATIVELY

Under the title of "Duluth Unions to Run Own Hospital," a recent issue of *C.I.O. News* tells of the hospital to be organized and operated coöperatively in Duluth, Minn., by CIO, AFL, and the Railroad Brotherhoods. Because a brick hospital building was vacant in West Duluth, and because downtown Duluth hospitals were overcrowded and rates so high that "another baby knocks a family budget badly out of kilter," the union coöperative has taken over the hospital. It is expected to be in operation by September.

Life membership for a family is \$100. Present plans indicate 75 days a year of hospital care including X-ray, operating room, etc., without extra charge, and free medical care. Charges, in addition to the life membership, have not yet been worked out.

PREMARITAL LAWS OF THE STATES

The January issue of *Pennsylvania's Health*, published monthly by the Pennsylvania State Health Department, is devoted to a summary and analysis of the state's premarital laws, together with a tabulation of similar laws in the other 47 states and the District of Columbia. This is a valuable service to Pennsylvania citizens particularly, and to those of other states as well.

MANY ARE THE USES OF PAPER CUPS

All you could possibly want to know about the size, shape, and varied uses of paper cups and containers is included in *Paper Cups and Containers At Your Service*. Attractively printed and illustrated, it is available from the Public

Health Committee of the Paper Cup and Container Institute, 1790 Broadway, New York 19.

NEW ENGLAND PIONEERS IN INTEGRATING HOSPITAL FACILITIES

"Regionalization in New England," a staff report of the Association's Subcommittee on Medical Care, offers a detailed account of the Bingham Associates Fund program for regional integration of hospitals in Maine and Massachusetts. The program of the Bingham Associates, organized in the early thirties, is aimed at improving the quality of care in rural areas by making available the skills of larger centers through diagnostic aid, hospital extension services, and postgraduate education, using approximately the pattern projected by the Federal Hospital Survey and Construction Act. The report, which is thoroughly documented, may be obtained from the Subcommittee on Medical Care, American Public Health Association, P. O. Box 5998, Bethesda, Md.

DESCRIPTIVE BOOKLET ON NATIONAL INSTITUTES OF HEALTH PUBLISHED

The National Institutes of Health (the name was officially changed to the plural by the 80th Congress) is described in a booklet recently published by the Public Health Service, Federal Security Agency. A very well written and well illustrated booklet of 28 pages outlines the historical development of this unique enterprise, beginning with the laboratory set up in the Marine Hospital on Staten Island in 1887 when bacteriology was a new science, traces the direction of the laboratory through Drs. Joseph J. Kinyoun, Milton J. Rosenau, John F. Anderson, George W. McCoy, L. R. Thompson, and now the present Director, R. E. Dyer. It is stated that the National Institutes of Health laboratories and their field stations are now staffed with about 150

commissioned officers, 750 professional and scientific personnel, 75 trainees and fellows, and some 475 others who provide essential administrative, scientific, and maintenance services in support of the research. In the immediate future a still greater expansion of facilities will come with the construction of a Clinical Center providing 500 clinical research beds and associated laboratories. These facilities will offer research opportunities for well trained medical and scientific personnel.

Separate chapters describe the work of the National Cancer Institute, of the Division of Physiology, the Sections on Cardiovascular Diseases and Gerontology, Chemotherapy, Dental Research, Nutrition, and Pharmacology. The booklet describes the Division of Infectious Diseases, the Division of Tropical Diseases, the Biologics Control Laboratory, Laboratory of Physical Biology, the Division of Research Grants and Fellowships, and the newly authorized Clinical Center.

This booklet is to be recommended for those who visit the Institutes and would be an excellent source of information for high school students and those in college who are familiarizing themselves with federally supported research in public health.

ANNUAL REPORTS

The *1947 Annual Report of the John and Mary R. Markle Foundation* is the report of what this foundation is doing to break the bottleneck of man power shortage by appropriations for medical research in colleges and universities and by a system of subsidizing the training of young scientists. Nearly half a million dollars were appropriated in 1947, bringing to a total of about 11,000,000 appropriations made during 20 years of the Foundation's existence. 14 Wall Street, New York 5.

This is Our Task is an attractive 16 page leaflet on heavy paper, printed in

gold and black, reporting on the activities of the Queensboro Tuberculosis and Health Association, 159-29 90th Ave., Jamaica 2, N. Y. For those who may not understand the expanse that is New York City, it should be said that Queens is the largest in area of the 5 boroughs of the city and the fourth largest in population. Its inhabitants number about one and a half million of the nearly 8 million that now make up the city.

A Backward Glance—A Forward Look is an annual report of one of the several district health committees in New York City. The area comprises 2 municipal health center districts, each with a population of more than 300,000. The report of the committee's activities in nutrition, health education, mass chest X-ray, etc., are briefly described in the 7 natural districts into which the area divides itself. An effective small compass report to the neighborhood on what its own committee is doing. Washington Heights—Riverside District Health Committee, 600 West 168th St., New York, N. Y.

Since the Merger is the title chosen for the Calhoun County, Michigan, Board of Health's 1947 annual report. The *Merger* refers to the consolidation of the health services of the City of Battle Creek and the rest of Calhoun County in 1944, resulting in a service unit of approximately 100,000 persons. Perhaps the most telling page is the double spread reporting that each department had some services, each was lacking some, and some were provided by neither department in 1944; in 1947 the whole county had a complete well rounded service. The report is short, done up in an attractive red cover, is printed in clear black and green on good quality paper. Its unspoken moral on almost every page is "In Union There is Strength."

The *1947 Annual Report of the National Committee for Mental Hygiene*

is a historical capsule as well as an annual report. Briefly and interestingly, it tells how the National Committee got where it is, how it fits in with other mental hygiene agencies, what it considers its job, and how it is doing that job. Pictograph illustrations help, as does a sweet humility in the writing. National Committee for Mental Hygiene, 1790 Broadway, New York 19.

DR. DOULL ON WHO

The U. S. Public Health Service has distributed, in mimeograph form, *Nations United for Health* by James A. Doull, Medical Director, Chief, Office of International Health Relations, U. S. Public Health Service. This is an address made at the May 29, 1948, Saturday morning Health Forum of the Harvard School of Public Health.

This gives a brief historical picture of modern international coöperation in health beginning with the Cholera Conference in Paris in 1857, carries it through the recent war period and the organization of the world health body. His "The Prospect" is a recital of the not too impossible goals WHO may be expected to achieve.

FIGHTING TUBERCULOSIS 40 YEARS IN WISCONSIN

The Crusader, the monthly organ of the Wisconsin Anti-Tuberculosis Association, uses its May issue to review the 40 years of its work in reducing tuberculosis in Wisconsin. In short, brightly written paragraphs, with excellent photographs, are told the stories of how the first sanatorium came to be, how public health nursing started, how a modern tuberculosis clinic developed, and finally how the "free care" law of 1945 came to be.

Oscar Lotz, M.D., has been the Executive Secretary of the Wisconsin Association since 1939, when he succeeded Hoyt E. Dearholt, M.D., who helped to found the Association in 1908 and

served as its executive from 1910 to 1939.

WAR MEMORIAL THAT MAKES SENSE

During World War II, 32 members of the Medical Society of New York State lost their lives in service. At the Society's annual meeting in May, 1948, the House of Delegates voted a mandatory assessment of \$12 per member to provide a sum of nearly a quarter of a million dollars as a memorial to these 32 physicians. The sum, to be used for the education of the 58 children of the deceased members, will provide \$600 a year for collegiate and professional training from the end of high school up to 25 years of age.

LET CIVIL SERVICE DO IT

There are some problems it is better to sidestep than to meet head on. That would appear to be the lesson of *Your Patronage Problem and Civil Service* prepared by the Louisiana Department of State Civil Service for the State Legislature. Though addressed primarily to legislators, it can be applied by public health and other administrators. Its prescription for patronage headaches is to let Civil Service handle them. The pamphlet is simply written, amusingly illustrated in black and white drawings, and is an excellent down-to-earth exposition of the functions—and non-functions—of a Civil Service Department. Prepared by the Louisiana Department of Civil Service, Baton Rouge. No information as to whether it is available.

ERRATA

The June *Journal*, p. 876, credited the National Society for Crippled Children and Adults with publication of *The Problem of Cerebral Palsy*. This was in error. It was published by the Association for the Aid of Crippled Children and distributed by the National Society for Crippled Children and Adults.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted. All books reviewed in these columns may be purchased through the Book Service.

Diagnostic Procedures for Virus and Rickettsial Diseases—*Thomas Francis, Jr., M.D., Chairman, Committee on Diagnostic Procedures for Virus and Rickettsial Diseases. New York: American Public Health Association, 1947. 347 pp. Price, \$4.00.*

It is a rare experience to read a book and feel that one has discovered the type of reference manual that has long been needed. This new addition to the publications of the American Public Health Association on laboratory methods falls into such a category. Investigations in the field of virus diseases have progressed so rapidly in recent years, and physicians are so constantly seeking the assistance of the laboratory for the solution of problems of diagnosis, that a reference source of this type is particularly timely.

The seventeen chapters are written by active investigators, who write with the authority that comes from experience. Methods are carefully described; precautions to be taken, limitations of techniques, and principles of interpretation, are thoroughly discussed. It is of particular value that methods capable of routine application are differentiated from those that are still essentially research procedures. Instructions are given for the collection and transportation of suitable specimens. These are of great value for those laboratories that are not equipped to work with viruses.

The compendium type of manual naturally makes some sacrifice in terms of evenness and conciseness of chapters, the length of which is not always proportional to their importance. The

chapter on poliomyelitis for example deals with techniques which are wholly beyond the reach of limited laboratories, and with dengue and phlebotomus fever no assistance can at present be offered to the clinician. The need for frequent and thorough revision in such a rapidly growing field is obvious, and in mumps for example, the necessary delay in publication has already resulted in the omission of important new developments.

The members of the committee that produced this book are to be congratulated. The publication is an exceptional accomplishment, and no active laboratory can safely be without this valuable reference. R. S. MUCKENFUSS

Vers la Médecine Sociale—*By René Sand. Paris: J. B. Baillière et fils. Liège Editors Desoer, 1948. 671 pp.*

For forty years René Sand (now Professor of Social Medicine at Brussels) has been a leader—perhaps the outstanding leader—in developing a broad and vital conception of the importance of social and economic factors in the promotion of the public health.

The term "social medicine" is difficult to define. In his introduction, Dr. Sand says that the art of prevention and of cure is "individual medicine" when applied to one human being alone, "public medicine" when applied to the whole population, and "social medicine" when applied to individuals and classes whose conditions of living require special social measures. A more formal definition is presented near the end of his volume in the following

terms: "Social medicine is the art of prevention and of cure, considered (in its scientific principles as well as in its individual and collective applications) from the point of view of the reciprocal relations which relate the health of men to the conditions of their life."

This book is in the main historical and is written with a depth of scholarship and a width of vision which has not before been achieved in this field. The author is equally at home in ancient Rome and in 20th century New Zealand. He cites Egyptian records of 3000 B.C. and the Constitution of the World Health Organization. His choice of salient events and of outstanding leaders is sound and acute—his source references, representative of every country and of every age. The volume is an invaluable and a definitive work of reference in its field.

Major chapters deal with the history of the medical profession in its various social and economic relations; hospitals, out-patient services and social services; personal hygiene; public hygiene; social hygiene; occupational hygiene; public assistance; and the basic sciences relating to men (demography, anthropometry, psychology, sociology, and the like). The chapter on Social Hygiene includes such subjects as maternal and infant and school health, and the control of tuberculosis, venereal diseases, mental diseases, degenerative diseases, etc.; so that Sand's "public hygiene" and "social hygiene" are both aspects of what we in this country call "public health."

One of the most suggestive discussions to workers in our field is the chapter on "Assistance" (which is so much less offensive a term than "Poor Relief") because this is an area with which most of us are unfamiliar. Particularly illuminating is the following list of recent trends in social service toward increasing emphasis on: (1) active participation by the beneficiaries

in providing such service for themselves; (2) utilization of preventive rather than merely palliative or curative means; (3) application of psychological medicine and reëducational techniques; (4) developing familial rather than purely individual action; (5) development of generalized assistance (pensions, social insurance, family allowance) rather than individual doles; (6) utilization of public rather than private agencies; and (7) replacement of empirical by scientific procedures. This is a far cry from traditional "poor relief"!

In a final chapter, Dr. Sand reviews 20th century advances of social medicine in Germany and Austria, France, Belgium, the Netherlands, Italy, Czechoslovakia, Romania, Jugo Slavia, Great Britain and its dominions, Eire, the United States, and Latin America, as usual with keen and sound perception of major trends.

To this point, the book is mainly historical and constitutes a work of reference which will be indispensable to every serious student of the phases of social progress with which it deals. To the reviewer, however, the best part of the whole volume is the last 30 pages, in which the author gives us his own views on the characteristics, fields, frontiers, and methods of social medicine and of the relations of social medicine to society as a whole and to the individual human being. We hope Dr. Sand will expand this section of his book to make a new volume. "Social medicine" has been discovered, of late, in England and the United States, with an enthusiasm which is gratifying; but the safest guide for the future is one who understands the past as thoroughly as René Sand. C.-E. A. WINSLOW

The Use of Aircraft in the Control of Mosquitoes — Sponsored by the American Mosquito Control Association, T. D. Mulhern, Sec'y-Treas. New Bruns-

wick, N. J., *A.M.C.A. Bull. No. 1*, 1948. 46 pp., 45 figs. Price, \$1.50.

Engineers, public health workers, and entomologists alike will welcome the appearance of this authoritative, up-to-the-minute brochure. The successful and spectacular use of aircraft during the war in the control of disease-bearing insects has given tremendous impetus to aerial attack on various insect problems under peacetime conditions.

There has been much loose thinking and talking about the aerial application of insecticides, and some misuse of aircraft in combating insect pests. This compendium of information dealing with all aspects of the subject covered by the title—and more—should help put us straight on many matters relating to this tremendously interesting and important activity.

The bulletin, prepared through the joint efforts of leading engineers, entomologists, wildlife experts, pilots, and directors of mosquito control projects, and edited by Dr. Paul F. Russel and others, is crammed with useful information. Not only does it meet the needs of those concerned with the use of aircraft in fighting mosquitoes but it will be very helpful to anyone employing aircraft in any insect control operation.

It is important that the public, and especially those employed in or considering the use of aircraft in applying insecticides, recognize that the control of insect pests and disease carriers involves much more than ability to fly an airplane. This publication helps to bring out the many factors that must be considered and supplies information which will help overcome difficulties and avoid serious mistakes.

Brief chapters are devoted to the history of the use of airplanes in mosquito control, types of aircraft and equipment used, DDT formulations and specifications, operational procedures, situations in which aircraft are useful, appraisal of results, precautions to be taken against

injurious effects, public relations, legislation and liability, and civil air regulations. Numerous bibliographical references, a list of dealers in DDT insecticides, and of aircraft spraying and dusting services are included.

Forty-five half-tones and diagrams of aircraft and insecticide dispersing equipment form an important part of the publication. FRED C. BISHOPP

Milk Products—By William Clunie Harvey, M.D., D.P.H., F.R.San.I., and Harry Hill, F.R.San.I., A.M.I.S.E., F.S.I.A. (2nd ed.). London: H. K. Lewis & Co., Ltd., 1948. viii + 343 pp. + 80 illus. Price, 30s.

The authors have discussed on 328 pages many of the sanitary and manufacturing problems connected with seven dairy products, viz., ice cream, cream, butter (and margarine), cheese, condensed milk, evaporated milk, and dried milk. In the eighth and last chapter, 20 pages are devoted to special milk drinks, including fermented milk, junket, whey and lactalbumin foods, malted milk, and chocolate milk.

After a historical and/or introductory treatise, the composition and food value of each item is considered. Manufacturing processes are described in detail in so far as pages will permit, associated with which are 80 illustrations of equipment. Sanitation is discussed in terms of (1) general contamination, (2) specific infections and digestive disturbances, (3) appropriate means for their prevention, and (4) microbiological methods for the detection and determination of the several contaminants. Selected procedures for chemical analysis are described. Each chapter contains copies and/or excerpts of legislation, mostly of British origin, for guidance of the control official and the manufacturer with respect to the sanitary care and the chemical composition required for each food.

The subject matter is reasonably well

organized with subtitles clearly shown in bold face. The printing is clear and the diction is unmistakable. Specific references to original documentary evidence concerning infections generally have been omitted. Errors of fact are the exception. Although elemental in some respects, the book can be recommended for student reference use and for guidance of commercial interests who desire general information. Like most information of this type when assembled in book form, it becomes historical.

A. H. ROBERTSON

Practical Food Inspection — By C. R. A. Martin. (3rd. ed.) London: H. K. Lewis & Co., Ltd., 1948. Vol. I, 316 pp. Vol. II, 284 pp. Price, 18s. net each.

Written presumably for use in the British Isles only for the "lay food inspectors," these two volumes are unique in several ways. Quite an amount of the information in Volume I, *Meat Inspection*, agrees with the information published as regulations governing meat inspection of the U.S.D.A., January, 1947, issue. (U. S. Government Printing Office); there is a surprising amount of information in Volume II, *Fish, Poultry, and other Foods*, that would be valuable to state, city or county regulatory food officials or sanitarians of the U. S.; there is no bibliography in either volume; and there is no mention made of any authoritative source from the Continent or the United States.

Some of the statements in both of the volumes have to be taken with several grains of salt. Examples of such statements are "The effects of refrigeration upon meat, as regards nutritive value, have not been the subject of reliable tests, but all are agreed that there is an impairment of the digestibility of both muscle and fat, particularly the latter, and also an absence of certain tissue-building substances in the meat juices,

which are present in the meat of home-killed animals"; and "Poisonous fungi can be distinguished from edible mushrooms by their pale-brown colour."

Volume I—*Meat Inspection*. The nine chapters of this volume deal with Physiology and Comparative Anatomy; Antemortem Inspection; Slaughtering; A System of Meat Inspection; Physiological Abnormalities; Pathological Abnormalities; Infectious Diseases; Parasites; and Preservation of Meat. Each is treated from the point of view of the experienced lay inspector operating as one who is enforcing the meat laws of Great Britain. Much of the basic information is accurate but if used by American inspectors, cross-reference must be made to the Federal Meat Inspection Act and Regulations.

Volume II—*Fish, Poultry and Other Foods*. The eight chapters in this volume discuss Fish, Poultry, and Game; Fruit, Vegetables, and Cereals; Canned Foods; Milk and Milk Products; Miscellaneous Foods; Food Poisoning; and Legal Procedure.

The chapter on fish is excellent, gives salient points concerning detection of staling and spoilage, and describes a number of seafoods common to the British Isles and many to this country. Some diseases of poultry are described in Chapter II and various types of game, including the ptarmigan (page 66) are described; but the only inspection data are "... it is the usual practice to seize game that is maggoty, and the flesh green, soft, flabby, and putrid"!

In the chapter on fruits and vegetables this statement appears, "Insects and their excrements may affect the taste and appearance of flour." Many of the tips on the inspection of canned foods in Chapter IV are good and the several pages devoted to this subject are worth while. The chapters on Milk and Milk Products and Miscellaneous Foods are interesting reading. Pasteurization is described in ten pages, and ice

cream in four pages, suprisingly brought up-to-date.

The chapter on food poisoning deals almost solely with bacterial infections; chemicals and other causes are mentioned however, in the opening paragraph, and the chapter on legal procedure is interesting and some of the sections of England's food laws could well be adopted in this country.

There are ample illustrations in each chapter. The books are bound attractively and the printing is readable. Considering that there are relatively few books on the subject of practical food inspections, these volumes may be of value to the health officer and his sanitarians.

FERDINAND A. KORFF

Nutrition and the Public Health: A Study Guide — By *Adelia M. Beerwkes, M.S., and John J. Hanlon, M.D., M.P.H.* Ann Arbor, Mich.: The Overbeck Company, 1947. 120 pp. Price, \$2.50.

This manual, which is offered to students of public health as an overview of nutrition, is organized into twenty-seven chapters plus supplementary and bibliographical material. Approximately half of the pages are devoted to "The Science of Nutrition" and the remaining to public health aspects and supplementary material. Granted that some historical interest may be lost by the necessary condensation, the scientific material is not oversimplified, and numerous applications of nutrition to public health are given consideration. The manual fulfils its objective: "to present the student of public health with a framework of the basic knowledge needed to appreciate the relation of nutrition to total health." This reviewer sees an equally helpful use for public health workers in the carefully selected bibliography and the nutrition education sources included in the supplementary material. The ideas and suggested pattern in chapters XXIII

and XXIV, "The Place of Nutrition in the Public Health Program," and "A Suggested Nutrition Program for a State Department of Health," will be of interest to health officers as well as to students of public health.

HAROLD R. SANDSTEAD

Radio Manual—A Guide to Broadcasting for "Mouth Health Education." New York: Oral Hygiene Committee of Greater New York, 1947. 320 pp. Price, \$4.00.

The first 260 pages of this book consist of radio talks and interviews on mouth health, selected from among those broadcast by speakers sponsored by the committee during the interval between the first edition of this book in 1939, and the current volume. These talks represent various phases of mouth hygiene, dentistry, an interpretation of the dental profession to the public. The talks contain much information of great value to the student of mouth hygiene, and should be excellent source material for those who are already motivated by personal problems or other driving force to seek information in this field. As examples of good radio, they could be much improved. They are too professionally self-conscious, too much concerned with what dentists want the people to know, and not enough with what people want to know. The two dissertations about the American Dental Association, which head the section on talks, are excellent in themselves, but they would not appeal to a radio listener unless he were a dentist or a relative of a dentist. The use of the interview format is usually stilted, unnatural and forced, rather than easy-to-listen-to interchange. There is scarcely a ray of humor to relieve the monotonous repetition of the details of mouth pathology. Most of these talks and interviews could have benefited from the attentions of writers more skilled in radio.

The second part consists of advice to dentists about the facts of radio. This is a satisfactory explanatory essay, though highly conservative. It stresses dignity of the profession, perhaps above the desirability of having a large and interested audience. It condemns commercial sponsorship, whereas the trend is toward greater coöperation with appropriate commercial sponsors, without loss of professional integrity and with the advantages of broadcasting technics which help to attract listeners.

Possibly the most significant revelation in the book is the tremendous amount of labor and coöperation which lies behind it. For this, great credit is due to the dental societies and the dentists of Greater New York who have made possible the Oral Hygiene Committee.

W. W. BAUER

Say It With Figures—By *Hans Zeisel*, New York: Harper, 1947. 250 pp. Price, \$2.50.

While this is primarily a manual for statisticians in the field of consumer and opinion research, it is a valuable text on the science of assembling and using social statistics of many kinds.

Public health agencies, both official and voluntary, must depend upon public support and understanding. It is useful for them to measure, therefore, from time to time, public knowledge and attitudes, and this text describes how to use data which may be accumulated for this purpose so that they will not yield spurious conclusions. Also health agencies sometimes need to evaluate the public acceptance of a given campaign or study, the effects of a particular program of health education. For the latter purpose, especially, the description of the panel technique which this book gives is useful. This technique differs from the customary polling of opinion of selected cross-sections at various times by interviewing the same group at different intervals.

Many of the techniques used by advertisers to estimate the effect of their advertising are equally adaptable to the health educator for ascertaining the effect of his educational program. Likewise the techniques of market research used by manufacturers to estimate the probable need of or the likely acceptance of their products are equally adaptable to health officers for the same purpose. Heretofore health agencies have been prone to rely rather on morbidity and mortality reports as guides to practice. These reports, however, reflect failures and only by inference do they indicate some of the existing problems.

The methods of statistical analysis outlined present nothing new to those skilled in the science of statistics except to illustrate how the principles of that science may be applied to the analysis of certain social situations with which the vital statistician is not usually accustomed to deal. For the imaginative health officer and health educator, it suggests exciting possibilities of a new approach to ancient problems.

HOMER N. CALVER

Russell Sage Foundation, 1907-1946. (2 Volumes.)—By *John M. Glenn, Lilian Brandt, and F. Emerson Andrews*. New York: Russell Sage Foundation, 1947. 746 pp. Price, \$5.00.

The Russell Sage Foundation, having discontinued the policy of making grants to outside agencies, has presented to the public an informative review of the grants in aid—totalling over nine million dollars—made to 119 agencies and special projects over a period of forty years. Support has been given in widely diversified areas of the general field of social work, including tuberculosis and child hygiene, as well as education, recreation, city planning, the technique of surveys and exhibits, industrial relations and delinquency. The record is impressive and inspiring.

C.-E. A. WINSLOW

Public Health in Foreign Periodicals

GEORGE ROSEN, M.D., PH.D.

EPIDEMIOLOGY is not concerned simply with individual sick people, but rather with all those factors and conditions that join together to produce disease in groups of individuals. This is already evident in the Hippocratic work *On Airs, Waters and Places*, which may be regarded as the first treatise on epidemiology. Interesting examples of the epidemiological approach are provided by a number of recent articles in foreign publications.

NATIVE CUSTOMS AND THE EPIDEMIOLOGY OF MALARIA IN SPANISH MOROCCO

The prevalence of malaria in Spanish Morocco is dependent on two sets of factors.¹ On the one hand, conditions favorable to anopheline development exist from early spring to late autumn throughout the entire territory wherever there are permanent or temporary collections of water. On the other hand, the customs and mode of life of the inhabitants tend to exert both favorable and unfavorable effects on the prevalence and spread of malaria. Ignorance, defective nutrition, inadequate treatment or complete lack of medical care, and poor living conditions favor the persistence and extension of the disease. A very important factor in the maintenance of endemic malaria is the establishment of military camps near native rural villages, and near breeding places of anophelines. As factors tending to limit the spread of malaria, Conillera mentions the proximity of cattle (leading to mosquito deviation), the location of villages in the highlands, and an apparent development by the adult natives of a kind of immunity. This is not uncommon in endemic areas

where the greater morbidity is found among infants and young children. In conclusion, it is suggested that factors such as those mentioned above must be taken completely into account before any measures for the control of malaria are undertaken.

EPIDEMIOLOGY OF TERTIAN MALARIA IN FINLAND DURING 1941-1945

Malaria is world-wide in its distribution and occurs in countries of northern Europe. Hernberg offers the experience with malaria in Finland during the war years.² Malaria was not common in Finland before the war. Severe outbreaks had occurred during the 19th century and early in the present century. Following the First World War malaria spread northward as far as the city of Archangel, and cases were reported from other parts of northern Europe. In Finland, 468 cases were recorded. This epidemic wave subsided, however, and in 1938 only 16 cases were reported. Of these, 12 were from the province of Viipuri in southeastern Finland adjoining Russia.

During the recent war, cases of malaria appeared in large numbers among Finnish troops. In 1942, 583 cases were reported; in 1943, there were 262 cases; and in 1944, 892 cases. A lesser number of civilian cases was reported and these are regarded as having been communicated from infected soldiers. Hernberg asserts that Soviet troops were the source of infection, but as the disease occurred principally on the Karelian Isthmus where it had previously been endemic one doubts whether this assertion is warranted. Furthermore, it should be noted that

no antimalarial prophylaxis was employed in the Finnish Army. The disease is benign in character and is due to *Plasmodium vivax*. The apparent vector in Finland is *Anopheles maculipennis*.

While studying cases of malaria in 1945, Hernberg found that these were almost exclusively men who had performed military service in malarious areas during the preceding summer. As the possibility of relapse was excluded, he inferred that the disease became manifest after an incubation period of 9 months. It is believed that the malarial parasite remains quiescent in the reticulo-endothelial system until spring. In this connection, it is of interest to note that in the Netherlands, *P. vivax*, which is prevalent, has a tendency to remain latent for many months after the sporozoites have entered the human body through the bite of an *Anopheles* mosquito. At the same time it should be pointed out that one cannot entirely exclude possible infection by hibernating mosquitoes, despite the author's belief to the contrary.

MEASLES EPIDEMICS IN HELSINKI, 1919-1944

Forsius made a statistical study of the epidemics of measles that had occurred in Helsinki from 1919 to 1944.³ During this period there were seven epidemics comprising a total of 12,831 cases. Among the cases in these epidemics, 3.2 to 6.8 per cent were over 18 years of age. The oldest reported patient was 58 years of age, the youngest 9 days. Of the patients over 18 years old, many were rural inhabitants who had moved to the city. It is of interest to note that the incidence curve for measles among children of school and preschool age showed a steep rise at the beginning of the epidemics, while among infants and youths the peak of the curve occurred toward the end of the epidemics. Infants during the first

half-year of life were immune to infection. During the measles epidemics fresh cases of tuberculosis were found to increase by 34.9 per cent. Nevertheless, there was no increase in cases of tubercular meningitis.

EPIDEMIOLOGY OF BRUCELLOSIS IN ARGENTINA

Investigation of brucellosis in Argentina began in 1931 at the Malbrán Bacteriological Institute.¹ It was soon found that in large areas caprine, bovine, and porcine brucellosis existed as an indigenous disease. Since then, studies have shown that *Brucella* infection exists in all the Argentine provinces between the twenty-second and forty-sixth parallels, southern latitude.

Up to the present, 2,430 cases have been reported. Three-quarters of the total incidence was in males. The age range of these cases was from 8 months to 82 years, although young adults predominated. Most of the cases are occupational in origin. In the plains area of Argentina, the chief source of infection is to be found in hogs and cattle, whereas in the Andean region goats are almost solely responsible. Direct human transmission is rare in both rural and urban districts.

In urban communities human brucellosis may arise from a variety of sources. Cases have been traced to direct contact in slaughterhouses, or to attendance in such infected places as slaughterhouses by workers such as painters, masons, or mechanics. Others are due to the consumption of raw or inadequately pasteurized milk; of infected milk products, particularly fresh cheese made from goat milk; or of insufficiently cooked meat or viscera of infected animals. Incidental laboratory infections, and the tasting of raw cream before making butter account for other cases. Interesting is the mention of sexual intercourse as a source

of human infection; no substantiating data are offered.

In rural districts, infection occurs chiefly in the case of certain occupational activities. Among these may be mentioned the milking of infected animals, the handling of aborted fetuses, or the removal of placental remnants following abortion.

The disease occurs at all seasons of the year, but is more common during the spring and summer.

EPIDEMIOLOGY OF TUBERCULOSIS IN CONCEPCIÓN, CHILE

As in other Chilean cities, the incidence of tuberculosis in Concepción is high.⁵ In fact, the mortality rate is even higher than the average for Chile as a whole. Apart from the diseases of childhood, in 1945, tuberculosis was the leading cause of death in the population as a whole. Among the preschool and school age groups, the mortality rate was higher for the females than for the males. Over the age of 25, however, the female mortality rate dropped below the male rate.

As might be expected, Mantoux tests show a high rate of infection in the population. Between 3.7 and 5 per cent of the population of Concepción are estimated to have active tuberculosis. Yet, it is noteworthy that in 1945, only 26.5 per cent of the total deaths occurred in a hospital, while the other 73.5 per cent occurred at home. The migration of young susceptibles from rural areas to the city in quest of industrial employment is adduced to explain the high mortality.

To combat this situation, it is proposed to coördinate all health services, to employ mass radiography, to provide enough hospital beds for active open cases, to carry out Mantoux tests in order to select those cases suitable for BCG vaccination, to carry on an intensive campaign of health education, and in conjunction with this campaign

to have home visiting by nurses who will teach personal hygiene.

A NEW EPIDEMIC OF TULAREMIA AT LÜLEBURGAZ IN EUROPEAN TURKEY

Tularemia was first recognized in Turkey in 1936 at Lüleburgaz in Thrace.⁶ In the same year the disease was also reported from central Anatolia, and in 1938 from eastern Anatolia.⁶ No further outbreaks of tularemia were reported until 1945, when 18 cases occurred at Lüleburgaz, 15 in military garrison and 3 among the civilian population.

Tularemia has long been endemic among the civilian population of Lüleburgaz. However, the disease occurred in such a mild form that medical assistance was rarely needed. After recognition of the presence of tularemia in Turkey in 1936, investigation established its existence throughout Thrace.

The epidemiology of the disease in Turkey has not been explained. It has been suggested that transmission is possible through *Ornithodoros lahorensis*, a tick that is widespread in Turkey. Another suggestion has been that the eating of infected animals, hares or quails, or the drinking of water contaminated by the droppings of quails, may be responsible for its spread. All efforts to obtain evidence on the role of ectoparasite or of rodents in the 1945 outbreak at Lüleburgaz were in vain. It is worth noting, however, that all the cases seemed to be connected in some way with a small stream named Kaymarca. In 1937, it had been possible to infect guinea pigs with water from this stream. All the patients in the 1945 outbreak had been in contact with this water; after it had been declared out of bounds for the soldiers, the epidemic among them ceased.

POLIOMYELITIS IN BULGARIA FROM 1931 TO 1945

Poliomyelitis has been endemic in

Bulgaria, small numbers of cases having been reported as occurring during all seasons.⁷ The maximal incidence was found in October. One hundred and twenty cases were reported in 1939, and 72 in 1940. In 1941, however, there was a sudden increase in the incidence of the disease; 471 cases were reported. Cases were more common in rural villages than in towns and cities. To explain this increase it is suggested that more virulent strains of the causative virus were introduced by German troops that passed through Bulgaria in 1941. Obviously, a hypothesis of this kind could hardly be verified. After 1941, the incidence of poliomyelitis dropped again, but it still remains higher than before the war.

SWISS MEDICAL EXPERIENCE WITH NUTRITION DURING THE WAR

Kapp shows that food resources in Switzerland were managed in the best possible way during 1939-1944.⁸ The rationing scheme employed bread, milk, and potatoes as the basic foods. Special account was taken of the needs of children and of workers performing heavy labor. Throughout the entire period only a small number of pathological cases due to food shortage occurred. Some cases of osteoporosity were observed that were very likely due to lack of fat, and fat-soluble vitamins. There was also some increase in the frequency of anemia. All in all, however, the Swiss experience is claimed to have

demonstrated the importance of scientific management of nutrition.

EPIDEMIOLOGICAL SIGNIFICANCE OF COCKROACHES IN DIPHTHERIA

A curious and interesting epidemiological note on diphtheria is reported from Holland.⁹ In the course of a serious rise in the number of diphtheria carriers (patients and staff) in a large hospital, investigation revealed that cockroaches in the institution were harboring diphtheria bacilli. Measures were undertaken to exterminate the cockroaches, and as their number dropped there was a concomitant decrease in the number of diphtheria infections. Finally, these ceased completely.

First Session—Paul Revere Banquet Hall, Mechanics Building

Presiding: A. HELEN MARTIKAINEN, Vice-Chairman.

STAFF RELATIONS OF THE HEALTH EDUCATOR *

A Program of In-service Training for Health Department Staff. ANN WILSON HAYNES.

Motivation in Health Education. IAGO GALDSTON, M.D.

Health Education—Through a Health Center. GERTRUDE E. FRIRES.

(Other speakers to be announced.)

* A portfolio on Motivation in Health Education, prepared under the guidance of Dr. IAGO GALDSTON, is on display in the Health Education and Publicity Headquarters.

PUBLIC HEALTH NURSING

First Session—Talbot Hall, Mechanics Building

Presiding: RUTH FREEMAN, R.N., Chairman.

INCREASING THE EXPERTNESS OF THE PUBLIC HEALTH NURSE

Use of University Facilities for Increasing Nursing Expertness. MARGARET S. TAYLOR, R.N.

Individual Guidance as a Means of Increasing Nursing Expertness. PEARL SHALIT, R.N.

On-the-job Training for Nurses without Specialized Public Health Training. CHRISTINE CAUSEY, R.N.

Building Expertness in a Clinical Field. EDNA BRANDT, R.N.

TUESDAY, 9:30 A.M.

SCHOOL HEALTH

First and Second Sessions—Rooms 405, 406, 407, and Salle Moderne, Statler Hotel

Presiding: JESSIE M. BIERMAN, M.D., Chairman.

ROUND TABLES ON SCHOOL HEALTH *

9:30-12:00 School Health Councils—Their Organization, Operation
2:30- 3:45 and Relationship to Community Health Councils.
Room 405, *Discussion Leader: JOHN L. MILLER, Ed.D.*
Statler

9:30-12:00 In-service Training Courses in Health Education for
2:30- 3:45 Teachers.
Room 406, *Discussion Leader: WARREN H. SOUTHWORTH, Dr. P.H.*
Statler

9:30-12:00 Techniques of Counselling Children with Health Prob-
2:30- 3:45 lems.
Room 407, *Discussion Leader: RUTH STRANG, Ph.D.*
Statler

4:00 P.M. Summary Session.
Salle Moderne,
Statler

The capacity of each room is 40. First come; first served. These round tables will last all day. At 4:00 P.M., summaries of the three round tables will be presented at a general session.

SUBCOMMITTEE ON MEDICAL CARE

First Session—Room B, Mechanics Building

Presiding: JOHN P. PETERS, M.D.

IMPROVING THE QUALITY OF MEDICAL CARE

By Training of Personnel. THOMAS D. DUBLIN, M.D., Dr.P.H.

By Group Medical Practice. DEAN A. CLARK, M.D.

By Regionalization of Hospitals. ALBERT D. KAISER, M.D.

By Sound Principles of Administration. EDWIN F. DAILY, M.D.

TUESDAY, 9:30 A.M.

VITAL STATISTICS

*First Session—Room C, Mechanics Building**Presiding: RUTH R. PUFFER, DR.P.H., Chairman.*

BASIC DATA

International Adoption of Principles of Morbidity and Mortality Classification. W. THURBER FALES, SC.D., AND IWAO MORIYAMA, PH.D.

Plans for the 1950 Population Census. A. ROSS ECKLER, PH.D.

Morbidity Statistics Derived from Sickness Insurance. BARKEV SANDERS, PH.D.

The Need for Statistics of Marriage and Divorce. SAM C. NEWMAN, PH.D.

Section Business.

TUESDAY, 12:30 P.M.

ENGINEERING

*Luncheon Session—Parlor A, Statler Hotel**Presiding: JOHN M. HEPLER, Chairman.**Section Business.**Committee Reports:*

Conference of Educators in Environmental Sanitation. *Chairman, ELLIS S. TISDALE.*

Exploration of Research Needs (in the Field of Environmental Sanitation). *Chairman, BLUCHER A. POOLE.*

Municipal Public Health Engineering. *Chairman, CHARLES L. SENN.*

Rural Sanitation. *Chairman, WILLIAM T. INGRAM.*

School Sanitation. *Chairman, HERBERT J. DUNSMORE.*

Report of the Engineering Section Council. *Chairman, JOHN M. HEPLER.*

PUBLIC HEALTH NURSING

*Luncheon Session—Ball Room Foyer, Statler Hotel**Presiding: RUTH FREEMAN, R.N., Chairman.*

TUESDAY, 2:30 P.M.

DENTAL HEALTH SECTION AND AMERICAN SCHOOL
HEALTH ASSOCIATION

Joint Session—Paul Revere Banquet Hall, Mechanics Building

Presiding: GEORGE A. NEVITT, D.D.S., *Chairman.*

A Good School Dental Health Program. A. HARRY OSTROW, D.D.S.

The Caries Problem of the School Child. KENNETH A. EASLICK, D.D.S.

Dental Caries Research Findings in a School Dental Program. WALTER J. PELTON, D.D.S.

The School Physician and the School Dental Health Problem. WILLIAM E. AYLING, M.D.

FOOD AND NUTRITION AND LABORATORY SECTIONS

Joint Session—Paul Revere Hall, Mechanics Building

Presiding: ARCHIE H. ROBERTSON, PH.D.

MILK

The Possible Significance of Milk and Water in the Spread of Virus Infections. GORDON C. BROWN, SC.D.

Comparative Study of Lancefield's Group "B" Streptococci of Human and Bovine Origin. A. POMALES-LÉBRON, PH.D., AND P. MORALES-OTERO, M.D.

Direct Microscopic Clump Counts of Bacteria as Used to Control a Pasteurized Metropolitan Milk Supply. FRANK E. MOTT.

Quality Control of Milk and Dairy Products with Direct Microscopic and Swab Tests. C. W. ANDERSON AND N. O. GUNDERSEN, M.D.

Direct Microscopic Clump Counts of Pasteurized Milk by Carbolated Methylene Blue, Newman Lampert No. 2 and the Acid- and Water-Free Staining Procedures. B. S. LEVINE, PH.D., AND L. A. BLACK, PH.D.

Preliminary Report on Studies to Formulate a New Agar Medium for the Standard Plate Count of Dairy Products. LEON BUCHBINDER, PH.D.

An Improved Medium for the Enumeration of Bacteria in Milk and Milk Products. M. J. PELCZAR, PH.D., AND HARRIETTE D. VERA, PH.D.

FOOD AND NUTRITION

Second Session—Reception Room, Mechanics Building

Presiding: MARJORIE M. HESLITINE, *Chairman.*

NUTRITION IN PUBLIC HEALTH

A Nutrition Course for Students of Public Health. ADELIA M. BEEUWKES AND JOHN J. HANLON, M.D.

(Cont.)

TUESDAY, 2:30 P.M.

FOOD AND NUTRITION (Cont.)

Training of Nutritionists for Public Health. ELDA ROBB, PH.D.

Training Physicians for Public Health Nutrition. FREDRICK J. STARE, M.D., PH.D.

Nutrition Programs for State Health Departments—A Progress Report. GRACE A. GOLDSMITH, M.D.

HEALTH OFFICERS AND PUBLIC HEALTH NURSING
SECTIONS

Joint Session—Grand Hall, Mechanics Building

Presiding: C. HOWE ELLER, M.D., AND RUTH FREEMAN, R.N.

PERSONNEL MANAGEMENT AND PROBLEMS

Panel Leader: HERMAN E. HILLBOE, M.D.

Participants:

DOROTHY DEMING, R.N.

DOROTHY C. LOWMAN, R.N.

FANNY WARNCKE, R.N.

ROBERT G. WEBSTER.

DAVID LITTLEJOHN, M.D., DR.P.H.

BERWYN F. MATTISON, M.D.

ROY L. CLEERE, M.D.

INDUSTRIAL HYGIENE

First Session—Room C, Mechanics Building

Presiding: CARL M. PETERSON, M.D., *Chairman.*

MAXIMUM ALLOWABLE CONCENTRATIONS

Panel Leader and Participants (to be announced).

LABORATORY

Second Session—Room A, Mechanics Building

Presiding: EDMUND K. KLINE, DR.P.H., *Chairman.*

A Serologic Procedure in a Public Health Laboratory. DANIEL WIDELOCKE, PH.D.

TUESDAY, 2:30 P.M.

LABORATORY (Cont.)

A Quantitative Turbidimetric Method for the Determination of Spinal Fluid Proteins. HILFRED N. BOSSAK, ARTHUR A. ROSENBERG, AND AD HARRIS.

Selection of Guinea Pig Complement from the Standpoint of Natural Antibodies. PAUL FUGAZZOTTO, PH.D.

Differentiation between Syphilitic and Non-syphilitic Serologic Reactions. REUBEN L. KAHN, D.Sc.

Routine Antistreptolysin Titrations in a Hospital Laboratory. LEO CRAVITZ, DR.P.H., AND CHARLES L. STEINBERG, M.D.

Unusual Cultures Submitted to an Enteric Laboratory for Study. MACDONALD FULTON, PH.D., AND M. L. CHILTON.

A Public Health Rh Program on a State-wide Scale. CLIFFORD I. ARCALL.

MATERNAL AND CHILD HEALTH AND VITAL
STATISTICS SECTIONS

Joint Session—Talbot Hall, Mechanics Building

Presiding: FORREST LINDER, PH.D., Vice-Chairman.

ADMINISTRATIVE USE OF RECORDS
ROUND TABLE

The Philosophy of Records. PAUL M. DENSEN, D.Sc.

Nursing. MARGARET G. ARNSTEIN, R.N.

Dental Health. JOHN W. KNUTSON, D.D.S., DR.P.H.

School Health. LEONA BAUMGARTNER, M.D., PH.D.

Maternal and Child Health. MYRON E. WEGMAN, M.D.

Federal Needs. EVELYN FLOOK.

SCHOOL HEALTH

CONTINUATION OF ROUND TABLES ON SCHOOL HEALTH

See page 1303.

TUESDAY, 2:30 P.M.

PUBLIC HEALTH EDUCATION

Second Session—Georgian Room, Statler Hotel

Presiding: DONALD A. DUKELOW, M.D., *Secretary.*

THE VOLUNTARY AGENCY IN HEALTH EDUCATION AND COMMUNITY ORGANIZATION

Council Programs Influencing the Health Education of the Public.
JOHN W. FERREE, M.D.

Teamwork of Official and Voluntary Health Agencies and Non-Health Agencies in Health Education. HOWARD W. GREEN.

Community Organization for Health Education. CLAIR E. TURNER, DR.P.H., D.Sc.

Community Health Education in Hawaii. RAYMOND G. NEBELUNG, DR.P.H.

SUBCOMMITTEE ON MEDICAL CARE

Second Session—Room B, Mechanics Building

Presiding: HUGH R. LEAVELL, M.D.

MEDICAL CARE PROGRAMS: PROBLEMS AND METHODS

Effect of Rising Costs on Prepayment Plans. C. RUFUS ROREM, PH.D.

Administrative Problems of a Blue Shield Medical Service Plan. CHARLES G. HAYDEN, M.D.

Coöperation of Physicians and Consumers in a Group Health Association. MELVIN L. DOLLAR.

Utilization of Physicians', Nursing, and Hospital Services During a Two Year Period—Trinity Hospital Study. MARGARET C. KLEM.

A Pattern of Local Services in the Saskatchewan Health Program.
FREDERICK D. MOTT, M.D.

TUESDAY, 6:30 P.M.

PUBLIC HEALTH EDUCATION

Dinner Session—Salle Moderne, Statler Hotel

Presiding: DONALD B. ARMSTRONG, M.D., *Chairman.*

Committee Reports.

Election of Officers.

Section Business.

Twenty-five Years of Public Health Education (Commemoration of the founding of the Section). H. E. KLEINSCHMIDT, M.D.

TUESDAY, 8:30 P.M.

FIRST GENERAL SESSION

Grand Hall, Mechanics Building

Presiding: MARTHA M. ELIOT, M.D., *President, American Public Health Association.*

Addresses of Welcome:

HONORABLE ROBERT F. BRADFORD, Governor of the Commonwealth of Massachusetts.

HONORABLE JAMES M. CURLEY, Mayor of the City of Boston.

JOHN H. CAULEY, M.D., Commissioner, Boston Health Department.

Presidential Address. The Cultivation of our Human Resources for Health in Tomorrow's World. MARTHA M. ELIOT, M.D.

Presentation of Sedgwick Memorial Medal Award..

WEDNESDAY, 8:00 A.M.

THE JOHNS HOPKINS UNIVERSITY ALUMNI

Breakfast Session—Salle Moderne, Statler Hotel

ALUMNI OF THE SCHOOL OF PUBLIC HEALTH,
UNIVERSITY OF NORTH CAROLINA

Breakfast Session—Hancock Room, Statler Hotel

GRADUATES' ORGANIZATION, SCHOOL OF HYGIENE,
UNIVERSITY OF TORONTO

Breakfast Session—Parlor B, Statler Hotel

WEDNESDAY, 9:30 A.M.

EPIDEMIOLOGY

Second Session—Parlor A, Statler Hotel

Presiding: M. E. BARNES, M.D., *Chairman.*

The Possible Prevention of Gonorrhea with Penicillin Tablets. A Preliminary Report. HARRY EAGLE, M.D., A. V. GUDE, Lt., j.g., M.C., U.S.N.R., G. E. BECKMAN, Lt., j.g., M.C., U.S.N.R., GEORGE MASS, M.D., COMDR., M.C., U.S.N., J. J. SAPERO, M.D., CAPT., M.C., U.S.N., AND J. B. SHINDLEDECKER.

Contact Investigation of Syphilis—A Current Appraisal. JOSEPH S. SPOTO, M.D. AND ALBERT P. ISKRANT.

(Cont.)

WEDNESDAY, 9:30 A.M.

EPIDEMIOLOGY (Cont.)

Certain Phases of the Epidemiology of Salmonellosis and Shigellosis.
JAMES WATT, M.D., DR.P.H.

Observations on the Epidemiology of Shigellosis Among Institutional Inmates in Puerto Rico. GUILLERMO ARBONA, M.D., AND LUIS GONZALES, PH.D.

Effect of Ultra-Violet Irradiation of Class Rooms on Spread of Mumps and Chicken Pox in Large Rural Central Schools. A Progress Report. ANNE M. BAHLKE, M.D., HILDA FREEMAN SILVERMAN, AND HOLLIS S. INGRAHAM, M.D.

BIOMETRICS SECTION OF THE AMERICAN STATISTICAL ASSOCIATION, BIOMETRICS SOCIETY, AND VITAL STATISTICS SECTION

Joint Session—Paul Revere Banquet Hall, Mechanics Building

Presiding: RUTH R. PUFFER, DR.P.H., *Chairman.*

MORBIDITY SURVEYS

ROUND TABLE

Moderator: GEORGE ST. J. PERROTT.

Opinion Poll Methods in Measuring Morbidity. GEORGE GALLUP.

Types of Morbidity Surveys. THEODORE D. WOOLSEY.

Sampling Methods as Applied to Morbidity Surveys. NATHAN KEYFITZ.

Contribution of the Survey Method to Epidemiology. ALEXANDER D. LANGMUIR, M.D.

Morbidity Sampling as a Function of the Health Department. HUNTINGTON WILLIAMS, M.D., DR.P.H.

WEDNESDAY, 9:30 A.M.

DENTAL HEALTH

Second Session—Parlor C, Statler Hotel

Presiding: GEORGE A. NEVITT, D.D.S., *Chairman.*

Neoplastic Lesions of Interest to the Dental Profession. FRANCIS P. MCCARTHY, M.D.

Prosthetic Replacement for Tissues Lost Through Cancerous Lesions. RALPH S. LLOYD, D.D.S.

The Dental Phases of the National Cancer Program. AUSTIN V. DEIBERT, M.D.

Simplified Case-finding Procedure for Congenital Syphilis. FRANK P. BERTRAM, D.D.S.

Section Business.

ENGINEERING SECTION AND INTER-AMERICAN
ASSOCIATION OF SANITARY ENGINEERING

Joint Session—Reception Room, Mechanics Building

Presiding: JOHN M. HEPLER AND CLARENCE I. STERLING, JR.

Sanitary Aspects of the WHO Program. ABEL WOLMAN, DR. ENG.

Arctic Sanitation. WILLIAM HARDENBERGH.

Public Health Engineering in Foreign Areas. JOHN M. HENDERSON.

Public Health Engineering in Bolivia. PAUL S. FOX.

Panel Discussion

Panel Leader and Participants to be announced.

Professional Education and Training Given Sanitation Personnel in Latin American Republics. GAYLORD W. ANDERSON, M.D.

Panel Discussion

Panel Leader and Participants to be announced.

The Sanitation Problems of Persons Encountered by UNRRA. FREDERICK F. ALDRIDGE.

Military Sanitation. LEONARD L. TRAGER.

WEDNESDAY, 9:30 A.M.

FOOD AND NUTRITION SECTION AND THE AMERICAN
SCHOOL HEALTH ASSOCIATION*Joint Session—Talbot Hall, Mechanics Building**Presiding:* MARJORIE M. HESELTINE AND DAVID VAN DER SLICE, M.D.

CHILD NUTRITION

The Relation of Nutrition to Infection in Children. JUNIUS M. RAWLINGS, M.D.*A Nutrition Study of a Group of Burlington, Vermont, School Children.* H. B. PIERCE, JOHN H. BROWE, M.D., R. F. KRAUSE, PH.D., SUSAN B. MERROW, AND C. A. NEWHALL, M.D.*Nutritional Reconditioning of Malnourished Children.* ELSIE MOYER.*Discussion: Educational Implications of Clinical and Research Findings.* ELIZABETH LOCKWOOD, DR.P.H.HEALTH OFFICERS AND MATERNAL AND CHILD
HEALTH SECTIONS*Joint Session—Paul Revere Hall, Mechanics Building**Presiding:* C. HOWE ELLER, M.D., AND A. L. VAN HORN, M.D.

PREMATURITY

Hospital Fatality Rates for Premature Infants. KATHERINE BAIN, M.D., JOHN P. HUBBARD, M.D., AND MARYLAND Y. PENNELL.*Hospital Facilities for Premature Infants in New York State.* EDWARD R. SCHLESINGER, M.D., AND ELIZABETH PARKHURST.*Premature Care in New York City Under EMIC.* HELEN M. WALLACE, M.D., AND LEONA BAUMGARTNER, M.D., PH.D.*Colorado's Premature Infant Care Program.* JOHN A. LIGHTY, M.D.*Louisiana's Premature Care Program.* SIDNEY S. CHIPMAN, M.D., AND WALDO L. TREUTING, M.D.

INDUSTRIAL HYGIENE

*Second Session—Room C, Mechanics Building**Presiding:* CARL M. PETERSON, M.D., *Chairman.**Poisoning Due to Ingestion of Wax Crayons.* H. BRIEGER, M.D.*The Health of Open Hearth Steelworkers Exposed to Sodium Fluoride.* DOHRMAN H. BYERS.

WEDNESDAY, 9:30 A.M.

INDUSTRIAL HYGIENE (Cont.)

The Dust Environment of the Cemented Tungsten Carbide Industry, with Particular Reference to Cobalt. LAWRENCE T. FAIRHALL, PH.D.

Physiological Response of Man to Ammonia in Low Concentrations. LESLIE SILVERMAN, SC.D., AND JAMES L. WHITTENBERGER, M.D.

Shavers Disease. ARTHUR J. VORWALD, M.D.

LABORATORY

Third Session—Georgian Room, Statler Hotel

Presiding: EDMUND K. KLINE, DR.P.H., *Chairman.*

Section Business.

A Method for the Bacteriological Examination of Edible Fat Preparations. BERYL F. CAPPS, MARY K. WOLLAM, AND NORMAN L. HOBBS.

The Laboratory Aspects of Cancer Treatment with Radioactive Isotopes. SHIELDS WARREN, M.D., AND JOHN Z. BOWERS, M.D.

A Comparison of *H. pertussis* Cultures by Mouse Protection and Virulence Tests. PEARL L. KENDRICK, SC.D., ELAINE L. UPDYKE, SC.D., AND GRACE ELDERING, SC.D.

Free Halogens: A Comparative Study of Their Efficiencies as Bactericidal Agents. LOUIS GERSHENFELD, D.Sc., AND BERNARD WITLIN, D.Sc.

Synergistic Action of Antibiotics in Experimental Infections. C. W. PRICE, PH.D., W. A. RANDALL, PH.D., HENRY WELCH, PH.D., AND V. L. CHANDLER, PH.D.

Studies on the Morphology and Antibiotic Resistance of *Haemophilus influenzae*. GEORGE E. FOLEY, MARY MCGARRY, M.D., AND HARRY SHWACHMAN, M.D.

In Vitro Antibiotic Effects on *Haemophilus ducreyi*. D. G. WETHERBEE, 1st Lt., M.C., MARJORIE A. HENKE, ROBERT I. ANDERSON, 1st Lt., M.S.C., E. J. PULASKI, MAJ., M.C., AND D. M. KUHN, COL., M.C.

WEDNESDAY, 9:30 A.M.

PUBLIC HEALTH EDUCATION

*Fourth Session—Room A, Mechanics Building**Presiding: DONALD B. ARMSTRONG, M.D., Chairman.*

ADMINISTRATIVE PROBLEMS IN PUBLIC HEALTH EDUCATION

Geographical Variations in the Educational Approach to Public Health Problems. (Speaker to be announced.)

Solving Health Education Problems Within a Region. HOWARD W. LUNDY, DR.P.H.

*Reports of Regional Chairmen.**Reports of Cross-Section Committee Chairmen.**Discussion.*PUBLIC HEALTH NURSING SECTION AND
SUBCOMMITTEE ON MEDICAL CARE*Joint Session—Grand Hall, Mechanics Building**Presiding: EDWARD S. ROGERS, M.D., AND ZELLA BRYANT, R.N.*

Home Nursing Service in the Health Insurance Plan of Greater New York. MARIAN G. RANDALL, R.N.

Nursing in a Nation-wide Program for Medical Care—Conclusions from Experience in the EMIC Program. RUTH G. TAYLOR, R.N.

The Montefiore Home Care Program. MARTIN CHERKASKY, M.D.

The Health Department and Vocational Rehabilitation. G. S. T. PEEPLES, M.D.

SCHOOL HEALTH

*Second Session—Room B, Mechanics Building**Presiding: JESSIE M. BIERMAN, M.D., Chairman.*

The School Health Section, 1948. JESSIE M. BIERMAN, M.D.

Principles for Consideration in Judging the Probable Effectiveness of Federal Legislation Designed To Improve the Health of Children of School Age. LEONA BAUMGARTNER, M.D., PH.D.

PERTINENT RESEARCH

An Evaluation of Various Audiometric Testing Procedures for School Children. THOMAS E. SHAFFER, M.D., AND DELYTE W. MORRIS, PH.D.

Absenteeism Studies in California and Canada. MARJORIE L. CRAIG.

Incidence of Heart Disease in Salt Lake City School Children. ROBERT H. ALWAY, M.D., AND E. B. HOLLEY, M.D.

Election of Officers.

WEDNESDAY, 12:30 P.M.

INDUSTRIAL HYGIENE

Luncheon Session—Parlor B, Statler Hotel

Presiding: CARL M. PETERSON, M.D., Chairman.

WEDNESDAY, 2:00 P.M.

FIRST SPECIAL SESSION IN COÖPERATION WITH THE
MASSACHUSETTS STATE DEPARTMENT OF HEALTH,
MASSACHUSETTS PUBLIC HEALTH ASSOCIATION,
AND HARVARD SCHOOL OF PUBLIC HEALTH

Grand Hall, Mechanics Building

*Presiding: VLADO A. GETTING, M.D., DR.P.H., CHARLES F. WILINSKY, M.D.,
JAMES S. SIMMONS, M.D., AND GORDON M. FAIR.*

LEMUEL SHATTUCK—STILL A PROPHET

Lemuel Shattuck: America's Great Public Health Pioneer. W. G.
SMILLIE, M.D.

Sanitation of Yesterday—But What of Tomorrow? ABEL WOLMAN, DR.
ENG.

The Vitality of Vital Statistics. HUGO MUENCH, M.D., DR.P.H.

The Shattuck Report a Hundred Years Hence. C.-E. A. WINSLOW, DR.P.H.

WEDNESDAY, 4:00 P.M.

GOVERNING COUNCIL

Second Meeting—Talbot Hall, Mechanics Building

PUBLIC HEALTH EDUCATION

Fifth Session—Room 405, Statler Hotel

Presiding: DONALD B. ARMSTRONG, M.D., Chairman.

Meeting of Section Council with newly elected officers.

WEDNESDAY, 6:30 P.M.

HARVARD UNIVERSITY ALUMNI ASSOCIATION

Dinner Meeting—Longwood Towers, 20 Chapel Street, Brookline, Mass.

WEDNESDAY, 6:30 P.M.

AMERICAN SCHOOL HEALTH ASSOCIATION

*Dinner Session—Salle Moderne, Statler Hotel**Presiding:* DAVID VAN DER SLICE, M.D., *President.**Presentation of the William A. Howe Award to:*

AMOS L. BEAGHLER, M.D.

SALLY LUCAS JEAN.

Responses: DR. BEAGHLER AND MISS JEAN.*Dinner Speaker:* HERMAN E. HILLEBOE, M.D.

WEDNESDAY, 7:15 P.M.

NATIONAL COMMITTEE OF HEALTH COUNCIL
EXECUTIVES*Dinner Session—Salmagundi Restaurant, 222 Beacon Street*

THURSDAY, 8:00 A.M.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY ALUMNI

Breakfast Session—Salle Moderne, Statler Hotel

UNIVERSITY OF MINNESOTA ALUMNI

Breakfast Session—Parlor B, Statler Hotel

YALE UNIVERSITY ALUMNI

Breakfast Session—Parlor A, Statler Hotel

THURSDAY, 9:30 A.M.

DENTAL HEALTH SECTION AND SUBCOMMITTEE ON
MEDICAL CARE*Joint Session—Room C, Mechanics Building**Presiding:* GEORGE NEVITT, D.D.S., AND NATHAN SINAI, DR.P.H.

Standards of Dental Care for All Age Groups. (Speaker to be announced.)

Provision of Dental Clinics in Hospitals and Health Centers. JAMES S
MILLER, D.D.S.Use of Auxiliary Personnel in Dental Care Programs. R. M. WALLS,
D.D.S.The Industrial Dental Program of the Pennsylvania State Department
of Health. EDWARD R. ASTON, D.D.S.

THURSDAY, 9:30 A.M.

EPIDEMIOLOGY, HEALTH OFFICERS, AND VITAL
STATISTICS SECTIONS

Joint Session—Grand Hall, Mechanics Building

Presiding: RUTH R. PUFFER, DR.P.H., AND FRANKLIN H. TOP, M.D., D.P.H.

CHRONIC DISEASE

The Chronic Disease Study of the California Department of Health.
WILTON L. HALVERSON, M.D., DR.P.H.

Chronic Disease as an Industrial Hygiene Problem. CLARENCE D. SELBY,
M.D.

The Use of Statistics in Cancer Control Programs. HAROLD F. DORN,
PH.D.

Diabetes Control in a County Health Department. (Speaker to be an-
nounced.)

MERIT SYSTEM SERVICE

First Session—Reception Room, Mechanics Building

Presiding: LEROY E. BURNEY, M.D.

THE LIFE STORY OF A PUBLIC HEALTH EXAMINATION

The Subject-Matter Consultant. DOROTHY DEMING, R.N.

The Psychometrician. LILLIAN D. LONG, PH.D.

The Reviewer. RAYMOND S. PATTERSON, PH.D.

The Field Consultant. CHARLES B. FRASHER.

The Test Administrator:

Merit Systems. THOMAS L. BRANSFORD, PH.D.

Schools. KATHLEEN M. LEAHY, R.N.

U. S. Public Health Service. SIDNEY H. NEWMAN, PH.D.

The Researcher. ROGER M. BELLOWS, PH.D.

The Examinee. JOSEPH P. GAREN, M.D., AND JAMES KING. (Other speakers
to be announced.)

Staff Consultants. ELIZABETH KENT LAZO AND ELAINE R. GRIMM.

Discussant: CHARLES B. FRASHER.

THURSDAY, 9:30 A.M.

FOOD AND NUTRITION AND LABORATORY SECTIONS

*Joint Session—Paul Revere Banquet Hall, Mechanics Building**Presiding:* MARJORIE M. HESELTINE AND EDMUND K. KLINE, DR.P.H.

NUTRITION IN INFECTION

Nutrition and Experimental Epidemiology. HOWARD A. SCHNEIDER, M.D.

The Influence of Protein Nutrition on Experimental Infection—Physiologic Aspects. JACK METCOFF, M.D., M.P.H.

The Relation of Nutrition to the Development and Course of Tuberculosis in Adolescence. JOSEPH A. JOHNSTON, M.D.

The Nutrition of Women with Active and Arrested Tuberculosis. MARGARET A. OHLSON, Ph.D.

Discussant: J. M. RAWLINGS, M.D.MATERNAL AND CHILD HEALTH AND SCHOOL HEALTH
SECTIONS AND THE AMERICAN SCHOOL HEALTH
ASSOCIATION*Joint Session—Talbot Hall, Mechanics Building**Presiding:* A. L. VAN HORN, M.D., AND JESSIE M. BIERMAN, M.D.PHYSICALLY HANDICAPPED CHILDREN OF SCHOOL AGE—MEET-
ING THEIR MENTAL, EMOTIONAL, SOCIAL, AND PHYSICAL
NEEDS

As Seen by an Educator. (Speaker to be announced.)

As Seen by a Medical Administrator. SAMUEL M. WISHIK, M.D.

Children with Special Problems. — A report by the National Tuberculosis Association. Discussed by members of the Committee:

CHARLES C. WILSON, M.D., *Chairman.*

GEORGE M. WHEATLEY, M.D.

HERBERT R. EDWARDS, M.D.

VIVIAN DRENCKHAHN

Discussion opened by: JESSIE M. BIERMAN, M.D., AND DOROTHY NYSWANDER, Ph.D.

THURSDAY, 9:30 A.M.

INDUSTRIAL HYGIENE, ENGINEERING, AND PUBLIC
HEALTH NURSING SECTIONS*Joint Session—Paul Revere Hall, Mechanics Building**Presiding:* CARL M. PETERSON, M.D., JOHN M. HEPLER, AND RUTH FREEMAN, R.N.

COMMON COMMUNITY AND INDUSTRIAL HEALTH PROBLEMS

Industrial Health Counseling by the Nurse in Industry. *ETHEL BURGE-SON, R.N.*Handling, Storage, and Disposal of Radioactive Isotopes. *ABEL WOLMAN, DR.ENG., AND ARTHUR E. GORMAN.*Contributions of Industrial Hygiene to Public Health. *THEODORE HATCH AND LEONARD GREENBURG, M.D.*Reports of Committees on Industrial Sanitation and on Air Pollution. *(Tentative.)*

PUBLIC HEALTH EDUCATION

Sixth Session—Parlors C, D, F, Hancock Room, Rooms 405, 406, 407, 408, 419, Statler Hotel

DISCUSSION OF CURRENT PUBLIC HEALTH EDUCATION PROBLEMS

*(Standing Committees of the Section. All interested A.P.H.A. members are invited to participate in the discussion of any subject within their interest.)*Public Health Education Planning. *Chairman, C. MAYHEW DERRYBERRY, PH.D. Parlor F.*Coördination of Public Health Education with Other A.P.H.A. Sections. *Chairman, MURIEL F. BLISS, PH.D. Hancock Room.*Public Health Films. *Chairmen, KENNETH D. WIDDEMER AND THOMAS C. STOWELL. Room 405.*Utilization of Commercial Advertising in Health Education. *Chairman, MARY CONNOLLY. Room 406.*Materials and Publicity. *Chairmen, RAE K. SHOEMAKER AND SALLIE E. BRIGHT. Methods of Highlighting Health Education Programs and Techniques in the Setting of a Conference—Ways in which exhibits, portfolios, graphic techniques, and personal consultation can be used at conferences to tell the story of successful health education programs. Room 407.*Press Relations. *Chairman, ANNA B. TOWSE. Room 408.*Scientific Exhibits. *Chairman, MARIE C. HARRINGTON. Room 419.*

THURSDAY, 12:30 P.M.

DENTAL HEALTH

*Luncheon Session—Parlor A, Statler Hotel**Presiding:* LESTER A. GERLACH, D.D.S., *Secretary.**Section Business:*REPORT OF YOUR REPRESENTATIVES TO THE NATIONAL HEALTH
ASSEMBLY

HAROLD HILLENBRAND, D.D.S.

ALLEN O. GRUEBBEL, D.D.S.,

ANNIE J. TAYLOR.

CARL L. SEBELIUS, D.D.S.

LESTER A. GERLACH, D.D.S.

THURSDAY, 2:30 P.M.

ENGINEERING

*Second Session—Reception Room, Mechanics Building**Presiding:* M. ALLEN POND, *Vice-Chairman.*Report of the Committee on Sewage Disposal. *Chairman,* LOUIS F. WARRICK.

Water-borne Diseases. IRVING R. BORTS, M.D.

Water Supply and Infant Cyanosis. CLARENCE W. KLASSEN.

Report of the Committee on Water Supply. *Chairman,* CHARLES R. COX.Report of the Committee on Bathing Places (Joint with the Conference of State Sanitary Engineers.) *Chairman,* WARREN J. SCOTT.

EPIDEMIOLOGY

*Third Session—Paul Revere Banquet Hall, Mechanics Building**Presiding:* M. E. BARNES, M.D., *Chairman.*Tuberculosis in the German Population, U. S. Zone of Germany.
PHILIP E. SARTWELL, M.D., CHARLES H. MOSELEY, M.D., LT. COL., M.C.,
U.S.A., AND ESMOND R. LONG, M.D., PH.D.

Recent Studies on the Specificity of the Tuberculin Test. LYDIA B. EDWARDS, M.D., AND CARROLL E. PALMER, M.D.

Histoplasmin Sensitivity and Coccidioidal Infections. CHARLES E. SMITH, M.D., MARGARET T. SITO, RODNEY R. BEARD, M.D., HOMER G. ROSENBERGER, M.D., AND EDWARD G. WHITING, M.D.

Some Epidemiological Considerations of Histoplasmin Sensitivity.
MICHAEL L. FURCOLOW, M.D., JOSEPH S. RUHE, D.V.M., AND IVAN L. BONNELL, M.D.

Trimming the Tuberculosis Register. JOHN H. KORNS, M.D.

THURSDAY, 2:30 P.M.

FOOD AND NUTRITION, HEALTH OFFICERS,
LABORATORY, AND ENGINEERING SECTIONS*Joint Session—Paul Revere Hall, Mechanics Building**Presiding:* HARRY E. GORESLINE, PH.D.

SANITARY PRACTICES IN THE FOOD INDUSTRY

A New Look in Food Sanitation. HENRY F. VAUGHAN, DR.P.H.

Development of an Adequate Educational Program on Sanitation in a Typical Food Industry—the Baking Industry. EDWARD L. HOLMES, PH.D.

The Organization and Execution of the National Cannery Association Program. N. H. SANBORN, PH.D., AND EDWIN J. CAMERON, PH.D.

New Developments in Laboratory Control of Food Sanitation:

- (1) Method for Elimination of Bacteriostasis from Quarternary Ammonium Compounds in Swab Rinse Test. G. M. RIDENOUR, PH.D., AND E. H. ARMBRUSTER.
- (2) The Effect of Borax on the Germicidal Efficiency of Alkali Washing Compounds. SIDNEY M. BERNSTEIN, M.D., AND MAX LEVINE, PH.D.

EDITORIAL BOARD

Luncheon Session—Ball Room Foyer, Statler Hotel

FRIDAY, 2:30 P.M.

SECOND SPECIAL SESSION

Imperial Ball Room, Statler Hotel

Presiding: REGINALD M. ATWATER, M.D., DR.P.H.

ROUND-UP SESSION—HIGH POINTS OF THE 76th ANNUAL MEETING

Participants:

Representatives of the Sections, of the Program Committee and members of Association Committees.

RESOLUTIONS COMMITTEE FOR BOSTON MEETING

Appointment of the Resolution Committee to serve at the Annual Meeting in Boston is announced by Martha M. Eliot, M.D., *President*. The members appointed are:

Hugh R. Leavell, M.D. *Chairman*
C. Earl Albrecht, M.D.
Katherine Faville, R.N.
Frederick D. Mott, M.D.
Myron E. Wegman, M.D.

Suggested resolutions can be sent to the committee, c/o the Association, now. As in the past, a resolutions box will be placed near the registration desk, Mechanics Hall in Boston, at the time of the Annual Meeting. The time for closing the box, as determined by the Executive Board, will be announced at that time.

Hotel Reservations at Boston

Members are asking which is the "Headquarters" hotel for the Boston Annual Meeting. The answer is that no one hotel has been designated headquarters for delegates because Boston's hotels, though numerous, are not large.

A Housing Bureau is being operated for the Association by the Boston Convention Bureau. We are asking members to select their own hotel from among those listed on page 1178. The application should be carefully filled in and mailed to:

The Housing Bureau
Boston Chamber of Commerce
80 Federal Street
Boston, Mass.

Convention activities will center largely in Mechanics Building. We rearrange the list of hotels below to show you their location with relation to Mechanics Building. No. 1 is nearest, 2 next in order of distance, and so on.

- | | | |
|-----------------------|-------------------------|----------------------|
| 1—Hotel Minerva | 6—Hotel Statler | 16—Hotel Manger |
| 2—Copley Square Hotel | 7—Hotel Bradford | 16—The Parker House |
| 3—Copley Plaza Hotel | 8—Hotel Touraine | 17—Hotel Continental |
| 4—Hotel Lenox | 9—Hotel Puritan | 13—Hotel Kenmore |
| 5—Hotel Gardner | 10—Hotel Somerset | 14—Hotel Braemore |
| 5—Hotel Hemenway | 11—Hotel Myles Standish | 15—Hotel Bostonian |
| 5—Hotel Vendome | 12—Hotel Sheraton | 16—Hotel Bellevue |

Single rooms are few and are hard to obtain. Rooms for double occupancy are strongly recommended. There is no question about the ability of Boston's hotels to accommodate the delegates to the Annual Meeting, but the Housing Bureau and the Local Committee ask the cooperation of the membership in seeking double rather than single room accommodations.

THE 76TH ANNUAL MEETING

Boston, Mass., November 8-12, 1948

Hotel Reservation Form

The hotels listed below have rooms available for Association delegates at the rates indicated. Please note that **NO RESERVATIONS WILL BE ACCEPTED DIRECTLY BY HOTELS.** Make your reservation through:

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

- Murray S. Acker, M.D., D.P.H., Health Region 3, Weyburn, Sask., Canada, Medical Health Officer
- R. E. Elvins, M.D., City Hall, San Angelo, Tex., Director, San Angelo-Tom Green County Health Unit
- L. D. Farragut, M.D., M.P.H., 1120 Franklin St., Houston 14, Tex., Director, Harris County Health Unit
- William B. Ganaposki, Box 295, 633 Spearman Ave., Farrell, Pa., City Health Officer
- Robert E. S. Kelley, M.D., 227 Commonwealth Ave., Boston 16, Mass., District Health Officer, Dept. of Public Health
- George E. Maddison, M.D., C.M., D.P.H., Moncton Tuberculosis Hospital, Moncton, New Brunswick, Canada, Director of Tuberculosis Control
- Mamoun Z. Mahayni, M.D., M.P.H., Midan Fokani Ave., Damascus, Syria, Public Health Officer, Syrian Ministry of Health
- Bertram E. Marks, M.D., Dept. of Health, Middletown, Conn., City Health Officer

Laboratory Section

- Ralph G. Aronstam, M.D., 858 W. Boston Blvd., Detroit, Mich., Prof. of Bacteriology, Great Lakes College
- J. Owen Blache, M.D., 2601 N. Whittier, St. Louis 13, Mo., Pathologist, Homer G. Phillips Hospital
- Rachel L. Dirks, 406 B. Ea. 28th, Vancouver, Wash., Bacteriologist, Clark County Health Dept.
- Deborah L. Friedman, 1865 University Ave., New York 53, N. Y., Student, Univ. of Michigan
- Rose R. Ichelson, 5841 Christian St., Philadelphia 43, Pa., Bacteriologist
- Gonzalo A. Mondragon, M.D., Maracaibo 46-60, Medellin, Antioquia, Colombia, S.A., Jefe del Laboratorio Departamental de Antioquia
- Marion Pfeiffer, 137 Vine, Park Ridge, Ill., Senior Laboratory Asst., Chicago Board of Health
- Karel Raska, M.D., 158 Srobarova, Public Health Institute, Prague XII, Czechoslovakia, Deputy Director
- Adele M. Snyder, 5525 Kimbark Ave., Chicago 37, Ill., Bacteriologist, State Dept. of Public Health

Vital Statistics Section

- Eddie V. Cooksey, Charity Hospital, Record Library, New Orleans, La., Medical Record Librarian
- Eugene K. Harris, 2704 Yale Station, New Haven, Conn., Graduate Student, Yale University, Dept. of Public Health
- Mary T. D. Jett, 4726a McMillan, St. Louis, Mo., Acting Asst. Medical Record Librarian, Homer G. Phillips Hospital
- Richard V. Kasius, M.P.H., U.S.P.H.S., Tuberculosis Control Division, Field Studies Section, Washington, D. C., Senior Asst. Sanitarian (R), Statistician
- Sister Mary Anne, Mt. Carmel Hospital, Pittsburgh, Kans., Administrator
- Audrey V. Ohlandt, 221 Foothill Blvd., Oakland 6, Calif., Statistician, Oakland Dept. of Public Health
- Estelle Schloderbach, 5447 Wilson Ave., Chicago, Ill., Asst. Medical Record Librarian, Cook County Hospital
- Charlotte P. Sell, J.C.R.S. Sanatorium, Spivak, Colo., Medical Record Librarian, Jewish Consumptives Relief Society
- Esther M. Sherard, 2601 N. Whittier St., St. Louis, Mo., Chief Registered Medical Librarian, Homer G. Phillips Hospital
- Helen G. Tibbitts, M.A., 1022 S.W. 11th Ave., Portland, Ore., State Registrar, State Board of Health
- Sister M. Wencesla, Margaret Mary Hospital, Rosemont, Batesville, Ind., Administrative Office Supervisor

Engineering Section

- George S. Bote, State Board of Health, P. O. Box 210, Jacksonville, Fla., Typhus Control Specialist, U.S.P.H.S.
- Glen E. Browning, 1449 W. 69th St., Los Angeles 44, Calif., Public Health Engineering Trainee, Oregon State Board of Health
- Harold F. Elkins, M.S.P.H., 1206 N. 64th St., Philadelphia 31, Pa., U.S.P.H.S., Research Fellowship
- Clyde F. Fehn, M.S., 605 Volunteer Bldg., Atlanta, Ga., Engineer (R), U.S.P.H.S.
- Charles C. Johnson, Jr., U.S.P.H.S., Mission Monrovia, Liberia, Engineer in Charge, Engineering Division
- Sheldon L. Lang, U.S.P.H.S., 15 Pine St., New York 5, N. Y., Engineer (R)
- George A. Prince, 39 North St., Hillsdale,

Mich., Public Health Engineer, Hillsdale County Health Dept.

Industrial Hygiene Section

Roland E. Byrd, M.S., 704 N. Pine St., Little Rock, Ark., Director, Division of Industrial Hygiene, State Board of Health

Wilber A. Mitchell, M.S., 119 Crestmoor Ave., Louisville 6, Ky., Industrial Hygienist, State Dept. of Health

Food and Nutrition Section

Isabelle F. M. Ackerman, 21 Shepard St., Cambridge 38, Mass., Nutrition Supervisor, Visiting Nurse Assn. of Boston

John C. Ayres, Ph.D., Iowa State College, Science Hall, Ames, Iowa, Assoc. Prof., Bacteriology Dept.

Robert E. Johnson, M.D., 1849 W. Pershing Road, Chicago 9, Ill., Director of Nutritional Research, WD Medical Nutrition Laboratory

Lelia C. Ogle, 1089 W. Michigan, Indianapolis 7, Ind., Nutritionist, State Board of Health

Robert E. Shank, M.D., 4 Garden Lane, Kirkwood, Mo., Prof. of Preventive Medicine and Public Health, Washington Univ. School of Medicine

Maternal and Child Health Section

Percy Boland, M.D., M.P.H., Casilla 43, Santa Cruz, Bolivia, South America, Chief Obstetrician, Hospital, San Juan de Dios, Santa Cruz

Katharine Dodge Brownell, M.D., 119 E. 78th St., New York 21, N. Y., New York City Dept. of Health, Bureau of Child Hygiene

Allan M. Butler, M.D., 62 Buckminster Road, Brookline, Mass., Prof. of Pediatrics, Harvard Univ.

Rose Ober, R.N., AJDC, c/o PCIRO Administrative Subunit, APO 407, New York, N. Y., Area Supervising Nurse, American Joint Distribution Committee

Public Health Education Section

Elizabeth H. Adler, M.P.H., 306A Lombard St., San Francisco, Calif., Director of Health Education, Dept. of Public Health, Oakland

Mary F. Arnold, M.P.H., 30 Wilson Drive, Ben Avon Heights, Pittsburgh 2, Pa., Student, Univ. of North Carolina

Alfred R. Clarke, 175 Union Ave., Rutherford, N. J., Editor, RN & Journal for Nurses

Elizabeth LeVell, R.N., 109 Lawrence Place, Baltimore 21, Md., Coordinator in Public Health, National Hospital School of Nurses

John H. Fountain, M.D., M.P.H., Director,

Division of Tuberculosis Control, Seattle Health Dept., Seattle, Wash.

Alfred L. Frechette, M.D., M.P.H., Director, Brookline Health Dept., Brookline, Mass.

David Frost, M.D., M.P.H., Health Officer, City Health Dept., Alameda, Calif.

A. Floyd Gardner, M.D., C.P.H., Board of Review, Member Discharges and Dismissals, Exec. Office of the Secretary, Navy Dept., Washington, D. C.

Roy O. Gilbert, M.D., Health Officer, Los Angeles County Health Dept., Los Angeles, Calif.

John T. Herron, M.D., Director, Bureau of Local Health Service, State Board of Health, Little Rock, Ark.

Albert E. Heustis, M.D., M.P.H., Director, Branch County Health Dept., Coldwater, Mich.

Walter R. Hewitt, M.D., Director of Health, University City, Mo.

Herbert A. Hudgins, M.D., Medical Officer and Associate Chief of Field Party, Institute of Inter-American Affairs, Port-au-Prince, Haiti

Walter C. Humbert, M.D., Director, Giles-Lincoln County Health Dept., Pulaski, Tenn.

Robert M. Hursh, M.D., Director, Bureau of Health, Harrisburg, Pa.

Clara R. Johns, M.D., M.P.H., Health Officer, Lee County Health Dept., Dixon, Ill.

Trois E. Johnson, M.D., M.P.H., Director, Division of Local Health Services, State Dept. of Health, New Orleans, La.

Walter B. Johnson, M.D., Deputy State and Dorchester County Health Officer, Cambridge, Md.

Max R. Kiesselbach, M.D., M.P.H., Medical Officer, Venereal Disease Division, U. S. Public Health Service, Washington, D. C.

Arnold B. Kurlander, M.D., M.P.H., Chief, Division of Tuberculosis, State Dept. of Health, Columbus, Ohio

George Loewenstein, M.D., Health Officer, Cumberland, Me.

Pascal F. Lucchesi, M.D., M.P.H., Superintendent and Medical Director, Philadelphia General Hospital, Philadelphia, Pa.

James C. Malcolm, M.D., M.P.H., Health

- Officer, Alameda County Health Dept., San Leandro, Calif.
- Berwyn F. Mattison, M.D., M.P.H., Commissioner of Health, Erie County Health Dept., Buffalo, N. Y.
- Thomas F. McGough, M.D., M.P.H., Health Commissioner, Tuscarawas County Health Dept., New Philadelphia, Ohio
- Demetrius A. Messiney, M.B., M.P.H., Chief of Mission to Ethiopia and Chief Medical Officer, World Health Organization, Geneva, Switzerland
- Abbott B. Mitchell, M.D., M.P.H., Director, Blood Plasma Program, State Dept. of Health, Lansing, Mich.
- James M. Mott, M.D., Director, Lawrence-Douglas County Health Dept., Lawrence, Kans.
- Lorenzo L. Parks, M.D., M.P.H., Director, Field Technical Staff, State Board of Health, Jacksonville, Fla.
- George S. T. Peeples, M.D., M.P.H., Director, Division of Crippled Children, State Board of Health, Columbia, S. C.
- Paul Q. Peterson, M.D., M.P.H., Chief, Bureau of Direct Services, State Dept. of Health, Columbus, Ohio
- John D. Porterfield, M.D., M.P.H., Director, State Dept. of Health, Columbus, Ohio
- Winston B. Prothro, M.D., M.P.H., Director, City-County Health Dept., Kalamazoo, Mich.
- Charles E. Reddick, M.D., Director of Local Health Administration, State Dept. of Health, Phoenix, Ariz.
- Dudley A. Reekie, M.D., M.P.H., Director, Dept. of Public Health and Welfare, Fort Worth, Tex.
- Reuben F. Reider, M.D., D.P.H., Assistant Chief, Laboratory Division, Communicable Disease Center, U. S. Public Health Service, Atlanta, Ga.
- Leonard A. Scheele, M.D., Surgeon General, U. S. Public Health Service, Washington, D. C.
- Dale E. Scholz, M.D., M.P.H., Health Officer, Lawrence-Wabash County Health Dept., Mt. Carmel, Ill.
- Mack I. Shanholtz, M.D., M.P.H., Director of Preventive Medicine Services, State Health Dept., Oklahoma City, Okla.
- Morris Siegel, M.D., M.P.H., Assistant Health Officer, New York City Health Dept., New York, N. Y.
- Charles F. Sutton, M.D., M.P.H., Chief, Division of Local Health Administration, State Dept. of Public Health, Springfield, Ill.
- Sterling P. Taylor, M.D., Health Officer, North Haven, Conn.
- James A. Thrash, M.D., M.P.H., Commissioner of Health, City-County Health Dept., Columbus, Ga.
- Charles C. Tudor, M.D., M.P.H., District Health Officer, Benton-Franklin District Health Dept., Pasco, Wash.
- Bruce Underwood, M.D., State Health Commissioner, State Health Dept., Louisville, Ky.
- Sidney S. Wasserstrom, M.D., M.S.P.H., District Health Officer, New York City Health Dept., Brooklyn, N. Y.
- John J. Wright, M.D., M.P.H., Professor of Public Health Administration, School of Public Health, University of North Carolina, Chapel Hill, N. C.

Laboratory Section

- Emanuel Appelbaum, M.D., Senior Bacteriologist and Chief, Division of Acute Infections of Central Nervous System, Bureau of Laboratories, New York City Health Dept., New York, N. Y.
- Jacques Archambault, D.Sc., Associate Director of Laboratories, Quebec Ministry of Health, Montreal, Que., Canada
- Joseph D. Aronson, M.D., Associate Professor of Bacteriology, Henry Phipps Institute, Philadelphia, Pa.
- Catharine Atwood, B.A., Bacteriologist in Charge, Boston Health Dept., Boston, Mass.
- Frederick Boerner, V.M.D., Advanced Bacteriologist, State Dept. of Health, and Assistant Professor of Bacteriology, School of Medicine, University of Pennsylvania, Drexel Hill, Pa.
- Janet M. Bourn, Ph.D., Bacteriologist, State Dept. of Health, Lansing, Mich.
- Chester W. Christensen, Ph.D., Special Instructor in Industrial Microbiology, Wayne University, Detroit, Mich.
- Frances L. Clapp, B.A., Director, Biological Testing Section, Lederle Laboratories Division, American Cyanamid Co., Pearl River, N. Y.
- Rita Clark, S.B., City Chemist, Bacteriologist, and Milk Inspector, Brockton Health and Water Depts., Brockton, Mass.
- Gilbert Dalldorf, M.D., Director, Division of Laboratories and Research, State Dept. of Health, Albany, N. Y.
- Gustave J. Dammin, M.D., Assistant Professor of Pathology and Internal Medicine, Washington University Medical School, St. Louis, Mo.
- Ben E. Diamond, M.A., Director, Division of Laboratories, State Board of Health, Pierre, S. D.
- Cornelia A. Eddy, M.S., Instructor, Dept. of

- Bacteriology, Tulane University, New Orleans, La.
- Norbert H. Fell, Ph.D., Chief, Pilot Plants, Engineering Division, Chemical Corps, U. S. Army, Frederick, Md.
- Joseph Felsen, M.D., Director of Laboratory and Research, Bronx Hospital, New York, N. Y.
- Florence K. FitzPatrick, Ph.D., Research Bacteriologist, Sharp and Dohme, Inc., Glenolden, Pa.
- Louis Gershenfeld, D.Sc., Director of Bacteriological Laboratories and Professor of Bacteriology and Hygiene, Philadelphia College of Pharmacy and Science, Philadelphia, Pa.
- Paul W. Kabler, M.D., M.P.H., Chief, Section of Medical Laboratories, State Dept. of Health, Minneapolis, Minn.
- Anne C. Kimball, Ph.D., Director, Division of Serology, State Dept. of Health, Minneapolis, Minn.
- Alfred S. Lazarus, Ph.D., Associate Professor of Public Health and Preventive Medicine, University of Washington School of Medicine, Seattle, Wash.
- Howard E. Lind, Ph.D., M.P.H., Director, Sias Research Laboratory, Brooks Hospital, Brookline, Mass.
- Col. Karl R. Lundeberg, M.C. (M.D., D.T.M. & H.), Assistant Chief Health Officer, The Panama Canal, Balboa Heights, C. Z.
- Robert A. MacCready, M.D., Assistant Director, Division of Communicable Diseases and Director, State Diagnostic Laboratory, State Dept. of Public Health, Boston, Mass.
- Harold Macy, Ph.D., Associate Director, Agricultural Experiment Station, University of Minnesota, St. Paul, Minn.
- John K. Miller, M.D., M.A., Associate Director, Division of Laboratories and Research, State Dept. of Health, Albany, N. Y.
- Harry E. Morton, Sc.D., Associate Professor of Bacteriology, School of Medicine, University of Pennsylvania, Philadelphia, Pa.
- John M. Pearce, M.D., Professor of Pathology, Cornell University Medical College, and attending Pathologist, New York Hospital, New York, N. Y.
- Lenore R. Peizer, B.A., Bacteriologist, New York City Health Dept., New York, N. Y.
- Henry D. Piersma, Ph.D., Director, Human Biological Section, Lederle Laboratories Division, American Cyanamid Co., Pearl River, N. Y.
- Charles R. Rein, M.D., Private Practice of Dermatology and Syphilology, and Associate Professor of Dermatology and Syphilology, New York University, New York, N. Y.
- Lawrence W. Slanetz, Ph.D., Bacteriologist, Agricultural Experiment Station and Professor of Bacteriology, University of New Hampshire, Durham, N. H.
- Mathilde Solowey, Ph.D., Acting Head, Microbiology Research Division, Bureau of Agricultural and Industrial Chemistry, U. S. Dept. of Agriculture, Washington, D. C.
- Randall L. Thompson, M.D., Sc.D., Professor of Microbiology, Indiana University, Indianapolis, Ind.
- Willard F. Verwey, D.Sc., Director of Bacteriological Research, Medical Research Division, Sharp and Dohme, Inc., Glenolden, Pa.
- George R. Weber, Ph.D., S. A. Scientist, U. S. Public Health Service, Cincinnati, Ohio
- Lyle A. Weed, M.D., Ph.D., Bacteriologist, Mayo Clinic, Rochester, Minn.
- Bernard Witlin, Sc.D., Research Bacteriologist, Sharp and Dohme, Inc., Glenolden, Pa.
- Mildred T. Woolley, Dr.P.H., Director of Laboratory, Long Beach Health Dept., Long Beach, Calif.
- Joseph Zichis, Ph.D., Assistant Chief Bacteriologist, State Dept. of Public Health, Chicago, Ill.

Vital Statistics Section

- F. Herbert Colwell, Dr.P.H., Statistics Consultant, State Health Dept., Seattle, Wash.
- Ann Dillon, M.S.P.H., Senior Statistician, State Dept. of Public Health, Nashville, Tenn.
- Harold F. Dorn, Ph.D., Chief, Office of Statistical Methods and Advisory Service, U. S. Public Health Service, Washington, D. C.
- Carl L. Erhardt, B.B.A., Registrar of Records and Director, Bureau of Records and Statistics, New York City Health Dept., New York, N. Y.
- Clifford H. Greve, M.S.P.H., Statistician and Assistant Chief, Program Analysis Section, U. S. Public Health Service, Washington, D. C.
- Paul H. Jacobson, A.M., Vital Statistics Analyst, Statistical Bureau, Metropolitan Life Insurance Co., New York, N. Y.
- Anthony M. Lowell, M.P.H., Assistant Statistician, New York Tuberculosis and Health Assn., New York, N. Y.
- Kurt Pohlen, Ph.D., Director, Dept. of Research and Statistics, Catholic Hospital Assn., St. Louis, Mo.
- Paul W. Shipley, B.S., Chief, Bureau of Records and Statistics, State Dept. of Public Health, San Francisco, Calif.

Engineering Section

- Joel C. Beall, B.S.C.E., Engineer and Director, Division of Sanitation, Macon-Bibb County Health Dept., Macon, Ga.
- Nelson Biaggi, M.S.S., Associate in Sanitary Science, School of Tropical Medicine, San Juan, P. R.
- A. Harry Bliss, M.S., Associate Sanitarian, School of Public Health, University of California, Berkeley, Calif.
- Henry E. Breedlove, M.S.S.E., Public Health Engineer and Director, Division of Sanitation, Mobile County Board of Health, Mobile, Ala.
- Charles G. Caldwell, M.S.S.E., Director, Division of Sanitary Engineering and Sanitation, State Dept. of Public Health, Santa Fe, N. M.
- Herman L. Felton, B.S., Technical Director, Orkin Exterminating Co. and Orkin Sanitation Services, Atlanta, Ga.
- Henry Greene, M.S.P.H., State Field Supervisor, Typhus Control Service, U. S. Public Health Service and State Dept. of Public Health, Macon, Ga.
- Attmore E. Griffin, Ph.B., Director, Technical Service Division, Wallace & Tiernan Co., Inc., Newark, N. J.
- William R. Hardy, M.S.S.E., City Sanitary Engineer, Dept. of Public Health, Fort Worth, Tex.
- Frederick S. Kent, M.P.H., Senior Assistant Sanitary Engineer, U. S. Public Health Service, Ann Arbor, Mich.
- Harold B. Robinson, M.P.H., Scientist (Milk and Food Sanitation), U. S. Public Health Service, New York, N. Y.
- Jack C. Rogers, B.S.C.E., Public Health Engineering Associate, Los Angeles City Health Dept., Los Angeles, Calif.
- James L. Rowland, Jr., M.S.P.H., Senior Sanitarian, State Division of Health, Jefferson City, Mo.
- Wilmer H. Schulze, Ph.D., Director, Sanitary Section, City Health Dept., Baltimore, Md.
- Alexander H. Zimmerman, Ch.E., Ventilation Engineer in Charge, Division of Industrial Hygiene, City Bureau of Heating, Ventilating and Industrial Sanitation, Chicago, Ill.

Industrial Hygiene Section

- Henry S. Brown, M.D., Medical Director, Michigan Bell Telephone Co., Detroit, Mich.
- Dohrman H. Byers, M.S., Scientist, Industrial Hygiene Division, U. S. Public Health Service, Washington, D. C.
- Lewis J. Cralley, Ph.D., Engineer, Industrial Hygiene Division, U. S. Public Health Service, Washington, D. C.

William A. McQuary, B.A., Acting Director, Division of Industrial Hygiene, State Board of Health, Little Rock, Ark.

Harry F. Schulte, M.S., Occupational Hygiene Engineer, University of California, Los Alamos, N. M.

Food and Nutrition Section

- Marjorie G. Abel, M.S., Chief, Bureau of Nutrition, Territorial Dept. of Health, Honolulu, T. H.
- Lillian Anderson, M.A., Director, Nutrition Service, Community Service Society, New York, N. Y.
- Stefan Ansbacher, Dr.Sc., Scientific Director, Hoosier Soybean Mills, Rockville Centre, N. Y.
- Ansta T. Barr, M.S., Regional Nutrition Consultant, U. S. Children's Bureau, Dallas, Tex.
- Esther L. Batchelder, Ph.D., Head, Food and Nutrition Division, Bureau of Human Nutrition and Home Economics, U. S. Dept. of Agriculture, Washington, D. C.
- Franklin C. Bing, Ph.D., Director, American Institute of Baking, Chicago, Ill.
- Bertlyn Bosley, Ph.D., Director, Nutrition Division, State Board of Health, Raleigh, N. C.
- Enos B. Buchanan, M.A., Deputy Commissioner of Health, Cleveland Division of Health, Cleveland, Ohio.
- Bertha S. Burke, A.M., Assistant Professor of Maternal and Child Nutrition, School of Public Health, Harvard University, Boston, Mass.
- Roy E. Butler, M.D., Senior Surgeon, U. S. Public Health Service, New Orleans, La.
- Howard E. Chaney, M.S., Chemist in Charge, Branch Chemical Laboratory, State Dept. of Health, Cambridge, Md.
- William J. Darby, Jr., M.D., Ph.D., Professor of Biochemistry and Assistant Professor of Medicine, School of Medicine, Vanderbilt University, Nashville, Tenn.
- Jane G. DeBuse, M.S.P.H., Nutrition Consultant, State Dept. of Public Health, Boise, Ida.
- H. C. Diehl, B.S., Director and Secretary, The Refrigeration Research Foundation, Berkeley, Calif.
- Conrad A. Elvehjem, Ph.D., Chairman and Professor, Dept. of Biochemistry, University of Wisconsin, Madison, Wis.
- John L. Etchells, Ph.D., Bacteriologist, Bureau of Agricultural and Industrial Chemistry, U. S. Dept. of Agriculture, Raleigh, N. C.
- Margaret S. Follstad, M.S., Nutrition Consultant, Tuberculosis Institute of Chicago and Cook County, Chicago, Ill.

- Robert S. Goodhart, M.D., Member, Food and Nutrition Board, and Chairman, Committee on Nutrition in Industry, National Research Council, New York, N. Y.
- Millicent L. Hathaway, Ph.D., Nutrition Specialist, Bureau of Human Nutrition and Home Economics, U. S. Dept. of Agriculture, Washington, D. C.
- Christine A. Heller, M.S., Nutrition Consultant, Territorial Dept. of Health, Anchorage, Alaska.
- Dorothy L. Husseman, Ph.D., Associate Professor, Home Economics Dept., University of Wisconsin, Madison, Wis.
- Almeda King, M.S., Nutritionist, State Dept. of Public Health, Boston, Mass.
- Pauline Beery Mack, Ph.D., Director, Ellen H. Richards Institute, Pennsylvania State College, State College, Pa.
- Lucy M. Maltby, Ph.D., Director of Home Economics, Corning Glass Works, Corning, N. Y.
- Edna M. McIntosh, M.S., Director, Dept. of Nutrition, Gerber Products Co., Fremont, Mich.
- Lillian L. Nash, M.S., Chief, Division of Nutrition, Cook County Dept. of Public Health, Chicago, Ill.
- Mildred E. Neff, M.A., Director, Nutrition Services, State Dept. of Health, Louisville, Ky.
- Milla E. Newland, M.S., Nutrition Consultant, State Dept. of Public Health, Burlington, Vt.
- Isabel Patterson, M.S., Nutrition Consultant, State Dept. of Health and Welfare, Augusta, Me.
- Leone Pazourek, S.M., Nutrition Consultant, State Dept. of Public Health, Springfield, Ill.
- Marguerite J. Queneau, M.A., Associate Nutritionist, State Health Dept., Albany, N. Y.
- Myra Reagan, M.S., Nutrition Consultant, State Dept. of Public Health, Atlanta, Ga.
- Elda Robb, Ph.D., Director, School of Home Economics, Simmons College, Boston, Mass.
- Tom D. Spies, M.D., Professor and Chairman, Dept. of Nutrition and Metabolism, Northwestern University Medical School, and Director, Nutrition Clinic, Hillman Hospital, Birmingham, Ala.
- Hulda Stettler, M.S., Nutrition Consultant, State Dept. of Health, Lansing, Mich.
- Robert P. Straka, Ph.D., Senior Microbiologist, Western Regional Research Laboratory, U. S. Dept. of Agriculture, Albany, Calif.
- Clara M. Taylor, Ph.D., Professor of Nutrition, Teachers College, Columbia University, New York, N. Y.
- Paul H. Tracy, Ph.D., Professor of Dairy Technology, University of Illinois, Urbana, Ill.
- Russell M. Wilder, M.D., Ph.D., Professor and Chief, Dept. of Medicine, Mayo Foundation for Medical Education and Research, Rochester, Minn.
- G. Dorothy Williams, M.S., Chief, Nutrition Division, New York City Health Dept., New York, N. Y.

Maternal and Child Health Section

- John A. Anderson, M.D., Ph.D., Professor of Pediatrics, University of Utah, Salt Lake City, Utah.
- Herbert Bauer, M.D., M.P.H., County Physician, San Luis Obispo County, Berkeley, Calif.
- Alice D. Chenoweth-Pate, M.D., M.A., Director, Division of Maternal and Child Health, State Dept. of Health, Louisville, Ky.
- Goldie B. Corneliuson, M.D., M.S.P.H., Director, Bureau of Maternal and Child Health, State Dept. of Health, Lansing, Mich.
- Edwin F. Gouldman, M.D., Obstetric Consultant, State Board of Health, Topeka, Kans.
- John M. Hayek, M.D., M.P.H., Director, Division of Maternal and Child Health, State Dept. of Health, Des Moines, Iowa.
- Herbert R. Kobes, M.D., M.P.H., Director, Division of Services for Crippled Children, University of Illinois, Springfield, Ill.
- Kenneth S. Landauer, M.D., Director of Medical Care, National Foundation for Infantile Paralysis, New York, N. Y.
- Ella Oppenheimer, M.D., Director, Bureau of Maternal and Child Welfare, D. C. Health Dept., Washington, D. C.
- Edward Press, M.D., M.P.H., Regional Medical Director, U. S. Children's Bureau, Chicago, Ill.
- Viola Russell, M.D., Director, Maternal and Child Health Division, State Dept. of Public Health, Burlington, Vt.
- Henry C. Schumacher, M.D., Medical Director and Consultant in Mental Hygiene, U. S. Public Health Service, San Francisco, Calif.
- Hart E. Van Riper, M.D., Medical Director, National Foundation for Infantile Paralysis, New York, N. Y.
- Samuel M. Wishik, M.D., Chief, Division for Physically Handicapped Children, New York City Health Dept., New York, N. Y.

Public Health Education Section

- William W. Bolton, M.D., Associate Director, Bureau of Health Education, American Medical Assn., Chicago, Ill.

- Bernadine Cervinski, M.P.H., Director, Division of Health Education, State Dept. of Health, Bismarck, N. D.
- Doris G. Chandler, M.P.H., Director of Health Education, National Society for the Prevention of Blindness, New York, N. Y.
- Helen Crosby, B.A., Director, Bureau of Social and Health Agencies, Metropolitan Life Insurance Co., New York, N. Y.
- Ira L. Ferguson, M.Sc., Associate Professor, Health Education and Safety Education, Southern University, Baton Rouge, La.
- William Griffiths, M.A., Director, Division of Public Health Education, State Dept. of Health, Minneapolis, Minn.
- Catherine D. Hidy, M.P.H., Public Health Educator, City Health Dept., Little Rock, Ark.
- Norma Johannis, M.P.H., Director of Health Education, State Dept. of Public Health, Denver, Colo.
- Ben D. Kiningham, Jr., M.P.H., Executive Secretary, Illinois Tuberculosis Assn., Springfield, Ill.
- Laura K. McCrory, M.P.H., Health Educator, City Health Dept., Minneapolis, Minn.
- Whitelaw R. Morrison, M.D., A.M., Professor of Hygiene and Physical Education, Oberlin College, Oberlin, Ohio.
- Raymond G. Nebelung, Dr.P.H., Executive Director, Public Health Committee, Chamber of Commerce, Honolulu, T. H.
- Morton A. Seidenfeld, Ph.D., Director of Psychological Services, National Foundation for Infantile Paralysis, New York, N. Y.
- Milton L. Shurr, M.S.P.H., Associate Executive Secretary, Health Division, Council of Social Agencies, Chicago, Ill.
- Myer Solis-Cohen, M.D., Assistant Director, Philadelphia Dept. of Public Health, Philadelphia, Pa.
- Josef J. Weisskopf, M.D., Surgeon and Chief, Treasury Dept. Health Units, Federal Employees Health Division, U. S. Public Health Service, Washington, D. C.
- M. Frances Frazier, R.N., M.P.H., Instructor, School of Public Health, Harvard University, Boston, Mass.
- Anna C. Gring, M.A., Director of Nursing, Public Health Nursing Service, Montclair, N. J.
- Ethel R. Jacobs, R.N., B.S., Director, Division of Public Health Nursing, State Board of Health, Indianapolis, Ind.
- Myona M. Morrison, M.P.H., Director of Public Health Nursing, Kern County Dept. of Public Health, Bakersfield, Calif.
- Jeannette Rosenstock, R.N., C.P.H., Director, Nursing Division, Topeka City-Shawnee County Health Dept., Topeka, Kans.
- Miriam M. Slight, R.N., B.S., Field Supervisor, Topeka City-Shawnee County Health Dept., Topeka, Kans.
- Julia C. Thompson, R.N., Acting Director, Nursing Division, Topeka City-Shawnee County Health Dept., Topeka, Kans.

Epidemiology Section

- Anne M. Bahlke, M.D., M.P.H., Medical Consultant, Bureau of Communicable Disease Control, State Dept. of Health, Albany, N. Y.
- Theodore J. Bauer, M.D., Venereal Disease Control Officer, U. S. Public Health Service, Chicago, Ill.
- Ward L. Chadwick, M.D., Director, Communicable Disease Division, Denver Dept. of Public Health, Denver, Colo.
- Abraham Gelperin, M.D., Dr.P.H., Director, Bureaus of Venereal and Communicable Diseases, New Haven Health Dept., New Haven, Conn.
- William M. Hammon, M.D., Dr.P.H., Professor of Epidemiology, University of California, San Francisco, Calif.
- Bascom Johnson, Jr., M.D., M.P.H., Assistant Chief, Dermatology and Syphilology Section, Veterans Administration, Washington, D. C.
- Herbert S. Miller, M.D., M.P.H., Director, Tuberculosis Control Service, State Division of Health, Jefferson City, Mo.
- William C. Spring, Jr., M.D., M.P.H., Commissioner of Health, Tompkins County Health Dept., Ithaca, N. Y.
- Thamara M. Stander, M.D., M.S.P.H., Epidemiologist, Nassau County Dept. of Health, Mineola, N. Y.
- James Watt, M.D., Dr.P.H., Surgeon and Medical Officer in Charge, Dysentery Control Project, U. S. Public Health Service, Pharr, Tex.

Public Health Nursing Section

- Flora H. Booth, R.N., B.S., Director of Nursing, Summit County Health Dept., Akron, Ohio.
- Mary L. Brown, R.N., M.P.H., Director, Public Health Nursing Instruction, Meharry Medical College, Nashville, Tenn.
- Meta L. Deininger, R.N., B.S., Director of Public Health Nursing, Tompkins County Health Dept., Ithaca, N. Y.
- Sara M. Errickson, R.N., B.S., Nurse Consultant, State Dept. of Health, Trenton, N. J.

School Health Section

- Helen L. Coops, Ph.D., Assistant Professor, Dept. of Physical and Health Education, and Health Coordinator, University of Cincinnati, Cincinnati, Ohio.
- Louella L. Haage, R.N., M.A., Supervisor of School Nurses, Jersey City Board of Education, Jersey City, N. J.
- Grace D. Keenan, M.S.Ed., Supervisor of Health Education, Brockton School Dept., Brockton, Mass.
- Cyrus H. Maxwell, M.D., M.S., Chief, Administration of School and College Health Services, U. S. Office of Education, Washington, D. C.
- Mary E. McGuire, M.S.P.H., Child Health Consultant, State Dept. of Public Welfare, Austin, Tex.
- Thomas R. O'Brien, M.D., Director of School Health, Health Dept., Lynn, Mass.
- Abraham B. Rosenfield, M.D., M.P.H., Director of Maternal and Child Health, State Dept. of Health, Minneapolis, Minn.
- George W. Snyder, M.D., Director of School Hygiene, Dept. of Education, St. Paul, Minn.

Dental Health Section

- Philip E. Blackerby, Jr., D.D.S., M.S.P.H., Director, Division of Dentistry, W. K. Kellogg Foundation, Battle Creek, Mich.
- Hugh R. McLaren, D.D.S., D.D.P.H., Assistant Chief, Dental Health Division, Dept. of National Health and Welfare, Ottawa, Ont., Canada.
- Joseph J. Obst, D.D.S., M.A., Private Dental Practice, and Secretary-Treasurer, Dental Information Bureau, Brooklyn, N. Y.
- Muriel K. G. Robinson, D.D.S., M.P.H., District Dental Officer, State Dept. of Health, Philadelphia, Pa.

Unaffiliated

- Herbert K. Abrams, M.D., M.P.H., Chief, Bureau of Adult Health, State Dept. of Public Health, San Francisco, Calif.
- Major V. Harry Adrounie, Bacteriologist, Medical Inspector and Preventive Medicine Officer, U. S. Army, Hq. 1 Corps, Medical Section, APO, San Francisco, Calif.
- Louis C. Barail, M.D., D.D.S., Chief Biologist-Bacteriologist, U. S. Testing Co., Inc., Hoboken, N. J.
- Morley B. Beckett, M.D., M.P.H., Chief Grade, Tuberculosis Section, Branch No. 11, Veterans Administration, Seattle, Wash.
- Leland J. Belding, M.D., M.P.H., Health Officer, Jackson Junction, Iowa.
- Capt. Otto L. Burton, MC, USN, (M.D., M.P.H.), Chief of Preventive Medicine, Bu-

reau of Medicine and Surgery, Navy Dept., Washington, D. C.

- Major George R. Carpenter, M.C., (M.D., M.P.H.), Assistant Chief, Preventive Medicine Branch, European Command, U. S. Army, APO, New York, N. Y.
- Leon A. Dickerson, M.D., Director, Kanawha-Charleston Health Dept., Charleston, W. Va.
- Frederick H. Downs, Jr., B.S., Director, Division of Milk and Dairy Products, State Health Dept., New Orleans, La.
- Joseph G. Fallon, M.P.H., Assistant Professor of Biology and of Nursing Education, Pacific Union College, Angwin, Calif.
- Harry S. Fein, M.D., M.S.P.H., Student, Dept. of Ophthalmology, Northwestern University Medical School, Chicago, Ill.
- Wilton M. Fisher, M.D., Ph.D., Surgeon (R), Laboratory Division, Communicable Disease Center, U. S. Public Health Service, Atlanta, Ga.
- Kenneth R. Gibson, D.D.S., M.S.P.H., Director of Dentists, Children's Fund of Michigan, Detroit, Mich.
- Max Gross, M.D., Director of Tuberculosis Clinics, New Jersey Sanatorium, Glen Gardner, N. J.
- Charles R. Hess, M.D., Section Chief, Veterans Hospital, Oteen, N. C.
- Marcus D. Kogel, M.D., General Medical Superintendent, City Department of Hospitals, New York, N. Y.
- Dominick J. Lacovara, M.D., M.A., Resident Psychiatrist and Chief Psychologist, Craig House Sanitarium, Beacon, N. Y.
- Hyrum L. Marshall, M.D., M.S., Professor of Public Health and Preventive Medicine, University of Utah Medical School, Salt Lake City, Utah.
- William Muhlberg, M.D., President, Cincinnati Board of Health and Treasurer, American Diabetes Assn., Cincinnati, Ohio.
- Walter L. Obold, Ph.D., Professor of Biological Sciences, Drexel Institute of Technology, Philadelphia, Pa.
- Frederick M. Offenkrantz, M.D., M.A., Clinical Pathologist, St. Joseph Hospital, Paterson, N. J.
- Herbert A. Perry, M.D., Superintendent and Medical Director, Eastern State Hospital, Medical Lake, Wash.
- Leslie W. Rowles, D.V.M., Director, Veterinary Division, Topeka City-Shawnee County Health Dept., Topeka, Kans.
- Mark M. Schapiro, M.D., M.S., Surgical Associate, American Hospital, Chicago, Ill.
- Norma G. Silver, M.S.P.H., Executive Secretary, Metropolitan Detroit Health Council, Council of Social Agencies, Detroit, Mich.

John G. Smith, M.D., Deputy Commissioner of Health, Cleveland Division of Health, Cleveland, Ohio.

John W. Spies, M.D., M.P.H., Director, Divisions of Communicable Diseases and Cancer, State Board of Health, Marshallton, Del.

Edward K. Steinkopff, M.D., Medical Director, Pinchurst Sanatorium, Janesville, Wis.

Allan Stone, B.A., Executive Director, Minnesota Division, American Cancer Society, St. Paul, Minn.

Alice B. Tobler, M.D., M.P.H., Assistant Deputy State Health Officer, State Dept. of Health, Annapolis, Md.

Samuel H. Zia, M.D., Professor of Bacteriology, Peiping Union Medical College, Peiping, China.

There is no tuition or laboratory fee involved. Travel and living expenses must be paid for by the individual or his employer. Applications or inquiries should be sent to Seward E. Miller, Senior Surgeon.

HARVARD BROADENS TEACHING PROGRAMS IN CANCER CONTROL AND MENTAL HYGIENE

The Department of Public Health Practice of the Harvard School of Public Health will expand its teaching and research programs in Cancer Control and in the public health aspects of Mental Health for the academic year beginning September, 1948.

The objectives of the new Cancer Control program will be administrative, epidemiological and statistical research in cancer, and the training of cancer control administrators for official and voluntary agencies. Students in the Cancer

curriculum may specialize in the administrative, epidemiological, health education, or statistical aspects of the problem. These students will receive both basic public health training and specialized cancer teaching under the direction of the Cancer Control staff of the Harvard School of Public Health in cooperation with Boston hospitals and agencies. The staff will consist of a director-epidemiologist, health educator, secretary, technical assistant, clinical instructors, health department personnel, and a biometrician. The project is financed jointly by a \$40,000 grant from the U. S. Public Health Service and a \$6,900 grant from the Massachusetts Division, American Cancer Society.

The broadened teaching program in the preventive aspects of mental hygiene has been made possible by the Grant Foundation, which has given \$230,000 for this purpose and for a five year investigation of certain problems of community mental health. The first community service center and research unit under the project will be established in Wellesley, Mass., in October, 1948. Groups participating in the Community Mental Health program are the Department of Social Relations of Harvard University, the Harvard Medical School, the Massachusetts General Hospital, the Wellesley Community Mental Health Committee, and the Harvard School of Public Health. The Mental Health staff will be composed of a director-psychiatrist, an assistant director, a service team, a research team, clinical psychologists, and technical assistants.

Officer of British Columbia.

AMERICAN BOARD OF PREVENTIVE MEDI-
CINE AND PUBLIC HEALTH
INCORPORATED

Culminating a plan that has been
long discussed in the councils of the
American Public Health Association's
Committee on Professional Education
and in the councils of the American
Medical Association and related groups,
the first meeting of the American Board
of Preventive Medicine and Public
Health, Inc., was held in New York City
on July 14. This meeting represented
the 3 incorporators of the Board, all of
whom were present, namely, Ernest L.
Stebbins, M.D., Robert H. Riley, M.D.,
and Reginald M. Atwater, M.D. Ac-
tion approving the incorporation had
been taken in early May through a
meeting in Washington attended by the
representatives of the American Medi-

cal Association, the American Public
Health Association, and other inter-
ested persons.

The American Board of Preventive
Medicine and Public Health has been
incorporated under the laws of the State
of Delaware. The incorporators organ-
ized with the appointment of Dr. At-
water as Chairman of the meeting and
Dr. Stebbins as Secretary. The perma-
nent officers of the Board will be chosen
at the first official meeting of the Board
of Directors which is expected to be
held in September.

It was reported that the certificate
of incorporation had been filed in the
office of the Secretary of State of the
State of Delaware on June 29, 1948,
and that certified copies had been re-
corded as required.

Dr. Stebbins as Secretary presented

to the meeting a form of proposed by-laws for the regulation of the activities and affairs of the corporation, which had been prepared and approved by the meeting of the representatives in May. These by-laws were duly submitted and adopted as the by-laws of the corporation. The by-laws provide that the members of the corporation are to be appointed by the American Medical Association and the American Public Health Association (3 members each), and by the Association of Schools of Public Health, the Southern Medical Association, and the Canadian Public Health Association (1 member each), a total of 9 members. It is provided further that one-third of the initial members of the corporation shall hold membership for a term ending at the first annual meeting of members of the corporation, one-third for a term ending one year thereafter, and one-third for a term ending 2 years thereafter. The incorporators proceeded with the 9 nominees and chose by lot the names to serve for 1, 2, and 3 years respectively. The vote resulted in the election of the following persons as trustees of the corporation for the terms indicated.

For a 1-year term:

Dr. J. H. Baille (C.P.H.A.), Toronto
Dr. F. C. Beelman (A.M.A.), Topeka, Kans.
Dr. Richard F. Boyd (A.P.H.A.), Washington, D. C.

For a 2-year term:

Dr. Ernest L. Stebbins (A.M.A.), Baltimore, Md.
Dr. Felix J. Underwood (S.M.A.), Jackson, Miss.
Dr. V. A. Van Volkenburgh (A.P.H.A.), Albany, N. Y.

For a 3-year term:

Dr. Walter L. Bierring (A.M.A.), Des Moines, Iowa
Dr. William P. Shepard (A.P.H.A.), San Francisco, Calif.
Dr. James S. Simmons, (A.S.P.H.), Boston, Mass.

The incorporators directed that announcements of the meeting as held should make clear that the Board was

not yet organized to receive applications for certification of candidates, but that steps were being taken to develop an application form and an examination procedure. Announcement will be made through the columns of the *American Journal of Public Health* and other channels when the Board is ready to receive applications, and instructions will be published regarding the method of submitting applications. In the meantime, the process of having the American Board of Preventive Medicine and Public Health, Inc., approved by the Advisory Council on Medical Specialties will be continued in order that diplomates of this Board, all of whom must be physicians, shall have standing comparable with the 16 other recognized specialty boards in the United States.

N.A.S. MEETS

The National Association of Sanitarians held its 12th annual meeting at Portland, Ore., July 7-9, 1948.

A progress report of the association's growth disclosed that 4 new sections were added representing Florida, Kansas, North Carolina, and North Dakota.

Officers elected and installed for the ensuing year were:

President—C. W. Clark, R.S., Portland, Ore.
Vice-President—Ed. McLarky, Sr., R.S., Los Angeles, Calif.
Treasurer—C. H. Zieler, R.S., Los Angeles, Calif.
Directors—Graves J. Grant, R.S., New Orleans, La.; Charles W. Ashbaugh, R.S., Kansas City, Mo.; Edwin A. Watkins, R.S., San Diego, Calif.
Board of Examiners—Clifford J. Baughman, R.S., Bakersfield, Calif.
Exec. Secretary—Roscoe C. Davis, R.S., Los Angeles, Calif.

The 13th annual meeting will be held in Los Angeles in 1949.

SHELLFISH BACTERIOLOGY LABORATORY

The U. S. Public Health Service has established a laboratory for studies of shellfish bacteriology at the Oceanographic Institution in Woods Hole,

Mass. One of its first projects will be a comparative study of various organisms such as coliform bacteria that have been used as indicators of sewage pollution of shellfish and shellfish growing waters. The Service, since 1925, in response to the request of the shellfish industry, has recommended minimum requirements for shellfish sanitation and has prepared a code of recommended practices that are the basis of legal regulations adopted by shellfish producing states.

MORE JOINT ACTIVITY IN WEST VIRGINIA

The Eastern Panhandle Cooperative Health Unit of West Virginia was recently established by Berkeley, Jefferson, and Morgan Counties with a combined 1940 population of about 60,000. Headquarters are in Martinsburg, and due to personnel shortages a temporary part-time health officer, G. P. Morison, M.D., has been named. Previous to this consolidation only Berkeley County was organized, Morgan County being served by a state health district, and Jefferson County having nursing service and a part-time health officer.

Cabell County and the City of Huntington are in process of organizing a city-county health department on approval of the County Court and the City Council. The *West Virginia Monthly News Letter* reports that the County Court's approval comes after 22 years of work.

Wood County and the City of Parkersburg, which already have joint health services, are organizing an official city-county health department with a single board of health.

WHO UP TO DATE

The May (Vol. 2, No. 5) *Chronicle of the World Health Organization* contains a general review of the work of the Interim Commission—the machinery of the Commission, the assimilation of existing international health activities,

work on such special problems as quarantine conventions, biological standardization, control of narcotics, malaria, tuberculosis, and venereal diseases, children's emergency fund, the Egyptian cholera epidemic, are all briefly reviewed. Available from World Health Organization, 350 Fifth Ave., New York, N. Y.

TYPHUS MENACE REDUCED IN GEORGIA

The State Department of Public Health carried on DDT dusting and rat eradication activities in 76 Georgia counties in 1947, with the result that in 5 of the most densely populated counties, comprising one-fourth of the state's population, the number of typhus cases decreased 57 per cent over 1946 and 92 per cent over 1945, when DDT dusting was begun. From a total of 1,111 cases of typhus reported in 1945, the number dropped to 436 in 1947, a decline of 61 per cent for the state as a whole. In 1947, DDT dusting was extended to include farm residences and outbuildings. More than 182,787 premises were dusted, nearly 35,000 more than in 1946. Poison bait was also used in some areas. Ratproofing buildings, refuse collecting, and sanitary land-fills were also employed in the campaign to reduce typhus.

METROPOLITAN CAMPAIGN TO REDUCE CHILDREN'S ACCIDENTS

Reducing the number of children's accidents is the objective of an intensive campaign now being launched by the Metropolitan Life Insurance Company with the coöperation of the U. S. Children's Bureau, the American Academy of Pediatrics, and the National Safety Council. Accidents are the leading cause of death among children of more than 1 year of age, with death rates per 100,000 population far surpassing those of any other cause. The program is planned to encourage public health, medical, safety organizations, and the

public to give greater attention to child safety. A 12 page booklet, *Help Your Child to Safety*, addressed to parents, emphasizes ways of combating physical hazards and unsafe practices resulting in injuries to children. The booklet and other source material is available from the company on request for use in local organized child safety programs. One Madison Avenue, New York, N. Y.

BEN MILLER NEW YOUTH HOSTELS' EXECUTIVE

Early in September Ben W. Miller assumed his duties as Executive Vice-President of American Youth Hostels, a newly created office which is planned to relieve the General Director, Monroe Smith, of other administrative duties to devote increasing attention to the development of the Youth Hostel program, particularly its international aspect. During the current summer more than 400 young people traveled to Europe under the auspices of American Youth Hostels, which has organizations in 24 countries.

Mr. Miller was formerly Secretary of the American Association for Health, Physical Education and Recreation.

TWO NEW SERVICES IN OHIO STATE HEALTH DEPARTMENT

In a recent reorganization a Bureau of Direct Services was created in the Ohio State Health Department. Under the direction of Paul Q. Peterson, M.D., this bureau is made up of the sanitary engineering, laboratory, vital statistics, industrial hygiene, and hospital divisions. Dr. Peterson will also be responsible for the department's public health training program.

In the Bureau of Local Services, a cancer division has been created with Walter B. Lacock, M.D., as Director.

"ACTION FOR SAFETY" A NEW ARRIVAL

In July, the National Commission on Safety Education of the National Education Association (1201 16th St., N.W.,

Washington 6, D. C.), began publication of *Action for Safety*, a monthly newsletter. Its purpose is to give information about the activities of the Commission and significant developments in safety education. Presumably available for the asking.

BALTIMORE JOINS THE MARYLAND MEDICAL CARE PROGRAM

In June, Baltimore's Mayor, Health and Welfare Commissioners, Johns Hopkins Hospital, and the University of Maryland Medical School, concluded arrangements for providing medical care clinic services for public assistance clients of the City Welfare Department. Thus Baltimore was brought into the state-wide medical care program for Maryland, in accordance with the recommendations of the Special Study Committee on Medical Care Needs of Baltimore City made early in 1947.

CALIFORNIA SURVEY OF CHRONICALLY ILL

By act of the 1947 state legislature, the California State Department of Health has a plan for an extensive investigation of the "problems involved in the reduction of deaths and disability from cancer and other chronic diseases." The outline of the plan was approved by the State Board of Public Health in November, 1947, and an advisory committee which was appointed at that time has held its initial meeting. Recommendations and estimated program costs for the survey will be placed before the legislature in 1949.

FIRST GRANTS FOR RESEARCH IN HUMAN REPRODUCTION

The February *Journal* (p. 311) reported on the program of research in human reproduction to be undertaken by the National Committee on Maternal Health. In July announcement was made of the first research grants in this program—5 grants totaling \$21,918—

for basic research seeking to throw light on factors governing fertility control and problems of infertility.

The 5 studies will be carried on at the University of Illinois, The Johns Hopkins University, Michael Reese Hospital (Chicago), the Worcester Foundation for Experimental Biology (Shrewsbury, Mass.), and the University of Witwatersrand, Johannesburg, South Africa. The grants were recommended by the National Research Council's Committee on Human Reproduction which is coöperating with the National Committee on Maternal Health in this program.

THE STATE OF CHILD HEALTH SERVICES

The first reports of the nation-wide study of Child Health Services, which the American Academy of Pediatrics has had in progress for three years under the direction of John P. Hubbard, M.D., have been published. Three are now available, of which two concern North Carolina, the pilot state for the study.

Child Health Services in North Carolina was originally published as a supplement to the *North Carolina Medical Journal* and is now available in reprints. It gives the background of the national study as well as a detailed account of the existing child care situation in the state. It finds North Carolina children at a disadvantage as to medical care in relation to those of other states and children in isolated rural areas at a disadvantage in relation to those near cities.

How Well Does North Carolina Provide for the Health of Its Children is the brief and graphic presentation of the same material geared to general public health education needs.

The third report currently published is *Health Services for the Rural Child* by Dr. Hubbard and others, and originally presented at the National Conference on Rural Health of the American Medical Association in February, 1948,

and first published in the *Journal of the American Medical Association*. This has extensive tabular material on hospitals, physicians, and dentists by states and counties.

Each report is available from the American Academy of Pediatrics, Study of Child Health Services, 2346 Massachusetts Ave., N.W., Washington 8, D. C., the second mentioned at \$1, the others presumably without charge.

BRITISH MEDICAL ASSOCIATION DECIDES TO COÖPERATE IN THE NATIONAL HEALTH SERVICE ACT

The British Information Services, in June, reported that "the last major obstacle to putting into effect the National Health Service, which provides all citizens who wish to use it with medical care, irrespective of their income was removed when on May 5, as a result of a plebiscite among its members, the British Medical Association decided that the profession would not refuse to coöperate in carrying out the National Health Service Act which went into operation on July 5."

Certain misgivings of the profession had led the British Association to advise its members to refuse to enter the scheme. This deadlock was broken when the Minister of Health gave assurance on the following points:

1. Full-time salaried service, which the profession opposes, would not be instituted without further legislation.
2. Every doctor in the Service would be completely free to publish his views on the organization and administration of the Service.
3. The Medical Practices Committee, which has power to schedule areas as over-doctored and prevent entrants into the public service in these areas, will review areas so scheduled after two years.

NEW OFFICERS OF NATIONAL NURSING AGENCIES

At the Biennial Nursing Convention of the American Nurse's Association, the National Organization for Public Health Nursing, and the National League for

combines the best use of medical knowledge and the best attack on sociological problems. This is particularly true of the distinguished career of Dr. Martha May Eliot.

Dr. Eliot is a member of a most distinguished family that has consistently made its contribution to the public welfare. She graduated from Radcliffe and received her medical degree from The Johns Hopkins School of Medicine. She then made a noteworthy study on rickets for the U. S. Children's Bureau and shortly became a member of the Bureau's staff. Since 1941 she has been associate chief of the Bureau and in 1947 was on the staff of the International Children's Emergency Fund Committee of the United Nations. As a member of this committee she made two trips to Europe in the interest of child health. To the medical profession and to the sociologist she is particularly known as the author of the Emergency Maternal and Infant Care program.

This year she was elected the first woman president of the American Public Health Association in recognition of her leadership in the public health field, particularly in maternal and infant care.

For her outstanding contributions to that very vital area of public health, which are admired by the medical profession, by the sociologists and by all humane and thoughtful people, I present her to you for the degree Doctor of Humane Letters, *honoris causa*.

President Allan Valentine, in conferring the degree, said:

Major contributor to the health of countless children, respected national leader of men in public health, you have personally united for human welfare those coy and nervous allies the physician and the sociologist, thus turning the past impossible into the future inevitable.

GRANGE RESOLUTION ON LOCAL HEALTH UNITS

The National Grange at its 81st annual meeting in Columbus, Ohio, in November, 1947, adopted the following resolution presented by its Interim Committee on Health:

Whereas:

1. A third of the population of the United States, particularly in rural areas, is without an organized local health department directed by a full-time health officer.

2. Twenty thousand of 38,000 different local governmental jurisdictions and 70,000 of 108,000 school districts are each attempting to operate their own health services.

3. Such small units of government cannot expect to have enough tax money to attract the necessary trained workers to carry out a public health service to which the people are entitled:

Therefore, Be It Resolved, that we favor:

1. The enactment of state laws authorizing the creation of 'county-wide, city-county, or multi-county units of health jurisdiction.

2. The employment of professionally qualified full-time health officers at appropriate salaries.

3. Requirements by law that health departments carry on certain essential standard activities.

This is one of a number of similar resolutions adopted by other agencies that took part in the Princeton Conference on Local Health Units. The Grange's Interim Committee on Health, of which Joseph W. Fichter, Ohio State Master is the Chairman, and Lloyd W. Halvorson, Grange Economist is Secretary, in June began a series of letters to state Grange officials, particularly health chairmen. The first letter pointed out that 40,000,000 persons are without the services of a full-time local health officer and urged Grange support of the local health unit's program adopted by the Princeton Conference and of federal and state legislation to assist local areas whose own resources are inadequate for maintaining their own health even after combining units of government to form a jurisdiction of at least 50,000 persons.

STANDARDIZED ANTIGENS

Arrangements have been made for the New York City Department of Health to furnish standardized Venereal Disease Research Laboratory cardiolipin—lecithin antigen—Mazzini and Kolmer antigens to the 20 serologic laboratories of the Department of Hospitals. Technicians from the laboratories of the Department of Hospitals will be trained in the use of these antigens in the laboratories of the Department of Health.

N.O.P.H.N. RESOLUTION ON LOCAL PUBLIC HEALTH SERVICES

The following Resolution was passed

half of children in this country and abroad. Active for more than three decades with the United States Children's Bureau, and its Chief since 1934, she has contributed immeasurably toward the Bureau's high standards of research and the development of its nonpartisan health and welfare services. A woman of rare courage and statesmanship, she has achieved noteworthy success in her chosen field.

Miss Lenroot also received the degree of Doctor of Humane Letters from Russell Sage College in Troy, N. Y., at the Thirty-first Commencement of the College on May 30.

SOUTHERN BRANCH, A.P.H.A., ANNOUNCES 1949 MEETING

George A. Denison, M.D., Secretary-Treasurer of the Southern Branch, A.P.H.A., who is Health Officer of the Jefferson County Board of Health, Birmingham, Ala., has announced on behalf of the Southern Branch that the 1949 Annual Meeting will be held April 14-16, inclusive, in Dallas, Tex., with headquarters at the Baker Hotel.

NORTHERN CALIFORNIA PUBLIC HEALTH ASSOCIATION MEETING

The Northern California Public Health Association held a dinner meeting on June 4 in Berkeley, at which the topic under discussion was "Shall Health Department Administration Be Combined with Public Hospital and Medical Administration."

Officers for 1948 have been reported as follows:

President—Harold F. Gray, Berkeley
President-Elect—C. Martin Mills, M.D., Richmond
Vice-President—Fannie T. Warncke, Oakland
Treasurer—Eugene M. Howell, Stockton
Secretary—L. Amy Darter, Berkeley
Representative on Regional Board, Western Branch, A.P.H.A.—Kenneth Haworth, M.D., Eureka

ARIZONA PUBLIC HEALTH ASSOCIATION

At its Annual Meeting held in Douglas, April 23-24, the Arizona Public

Health Association elected new officers as follows:

President—Oscar V. Cooper, Phoenix
President-Elect—Marion Sprague, Phoenix
Vice-President—George W. Marx, C.E., Phoenix
Secretary—Helen Rotthaus, Phoenix
Treasurer—Mary Peterson, Phoenix

DENVER ORGANIZES ITS HEALTH AND HOSPITAL STRUCTURE

A Bureau of Health and Hospitals has been created in the Department of Health and Charity of the City and County of Denver, Colo. The function of this bureau will be to plan and administer the programs and services previously administered by the Department of Hospitals and the Department of Health of the City.

The creation of the new bureau coincides with the return of Dr. Lloyd Florio to his position as Professor of Public Health and Preventive Medicine at the University of Colorado School of Medicine. Dr. Florio has been on leave from the School of Medicine for the past year and was appointed Health Officer of the City and County of Denver to implement the programs outlined in a survey under the direction of Dr. E. G. McGavran completed in the early months of 1947.

The newly created bureau will have a single board which will exercise advisory and delegated functions over both the health and hospital programs. Dr. Florence R. Sabin will continue in her post as Manager of Health and Charity for the City and County of Denver. The Director of the new Bureau of Health will be Dr. James P. Dixon, who previously served in the capacity of Medical Director of the Denver General Hospital.

Dr. Dixon says that it is the intent not only to further administrative efficiency, but also to work out procedures whereby programs of preventive and curative medicine can be effectively coordinated and integrated.

PERSONALS

Central States

ROBERT BARR, M.D.,† hitherto Chief of the Section of Departmental Administration, and earlier Director of the Division of Local Health Services, has been made Chief of the Section of Special Services, Minnesota Department of Health. At the same time the Division of Local Health Services, headed by PERCY T. WATSON, M.D.,* has been transferred to the Section of Special Services. Dr. Barr succeeds VIKTOR O. WILSON, M.D.,* who became Rochester, Minn. Health Officer on May 15 and is in turn succeeded by J. W. BROWER† in the Section on Administration.

RUTH BISHOP has been appointed as Resident Lecturer in Public Health Nursing, School of Public Health, University of Michigan, Ann Arbor. Miss Bishop has had staff nurse, student instructor, and supervisor experience with the Visiting Nurse Association, Cleveland; the Hillsdale County and Wayne County Health Departments in Michigan; as well as 2 years in the Army Nurse Corps.

LEROY DAVENPORT, D.V.M.,† is the new consultant in Veterinary Medicine of the Division of Communicable Diseases, Illinois State Department of Health. He was formerly Assistant to the Superintendent of the Illinois Division of Livestock Industry.

FLOYD M. FELDMAN, M.D.,* has resigned as Health Officer of Rochester, Minn., to accept appointment as Medical Director in the U. S. Public Health Service where he has been placed in charge of the Central Coordination and Analysis Office, Tuberculosis Study Section, Washington, D. C.

VERNON G. MACKENZIE,† who recently returned from a 9 month assignment with the Public Health Section of the American Mission for Assistance to

Greece, on July 1 became Officer in Charge of the Federal Security Agency's Water and Sanitation Investigations Station in Cincinnati. He succeeds HAROLD W. STREETER,† who retired after 34 years with the U. S. Public Health Service.

DONALDSON F. RAWLINGS, M.D.,† was appointed Chief, Division of Maternal and Child Health, Illinois Department of Public Health, effective July 6, to succeed RUTH DUNHAM, M.D.,† who resigned to accept a commission in the U. S. Public Health Service.

CHARLES F. SUTTON, M.D.,† has succeeded RICHARD F. BOYD, M.D.,* as Director of Local Health Administration, Illinois State Health Department, having previously served as Assistant Director.

VIKTOR O. WILSON, M.D.,* has resigned as Director of the Division of Child Hygiene, Minnesota State Department of Health, Minneapolis, to become Health Officer of Rochester, Minn., succeeding FLOYD M. FELDMAN, M.D.,* resigned.

Eastern States

LEVERETT D. BRISTOL, M.D., Dr.P.H.,* of Bethayres, Pa., has been appointed Chief of the Division of Cancer Control, Pennsylvania State Department of Health, Harrisburg. Dr. Bristol has recently served as Commissioner of Health and Welfare in the State of Maine and formerly was Director of Health, American Telephone and Telegraph Company.

JOHN E. FARRELL, Sc.D.,* Executive Secretary of the Rhode Island Medical Society, and of the Council of the New England State Medical Societies, was elected Secretary-Treasurer of the National Conference of Presidents and Other Officers of State Medical Associations at the 4th annual meeting of that group in Chicago in June.

DOUGLAS H. FRYER, M.D.,† of Phila-

delphia, Pa., accepted a position, beginning August 1, as Commissioner of Health, Columbia County, Hudson, N. Y.

F. C. LAWLER, Sc.D.,* formerly with the J. T. Baker Chemical Company, Phillipsburg, N. J., has recently been appointed Director of the Vermont Laboratory of Hygiene, Burlington, Vt.

JAMES L. MCCARTNEY, M.D.,† has been elected President of the Nassau Neuropsychiatric Society recently organized by the private practising neurologists and psychiatrists of Nassau County, New York.

HERBERT R. MORGAN, M.D., formerly Senior Fellow in Virus Diseases, National Research Council, at the Thorndike Memorial Laboratory of the Boston, Mass., City Hospital, has been appointed Associate Professor of Epidemiology, School of Public Health, and Assistant Professor of Internal Medicine, Medical School, University of Michigan, Ann Arbor.

E. R. NAILLARD, M.D., on July 1, was appointed Director of the new laboratory and research bureau of Nassau County, New York, Health Department.

BASIL O'CONNOR,† Chairman of the American National Red Cross, and President of the National Foundation for Infantile Paralysis, in May was awarded a gold medal of the National Institute of Social Sciences. Under his guidance, the Institute stated, the National Foundation "has achieved a high and permanent place in the land, offering new hope for stricken youth to face courageously a brighter future."

C. A. SARGENT, M.D.,† for many years District Health Officer of the New York State Department of Health, has been appointed Commissioner of

Health of Syracuse, N. Y., succeeding H. BURTON DOUST, M.D.†

Southern States

BRIG. GEN. LEON A. FOX, M.C., U.S.A.,* was made an Honorary Commander of the Most Excellent Order of the British Empire on July 22. The award, presented by Sir Oliver Frank, the British Ambassador to the United States, was in recognition of General Fox's service and aid to the British Armies while serving as Field Director of the United States Typhus Commission.

BRUCE UNDERWOOD, M.D.,† was recently appointed Health Officer of Kentucky to succeed PHILIP E. BLACKERBY, SR., M.D.,† deceased. Dr. Underwood has had 6 years' experience as a local Health Officer in Kentucky and Florida and most recently has been in private practice in Morganfield, Ky.

Western States

JOHN D. FOUTS, M.D.,† is the Director of the newly formed Bellingham-Whatcom County, Washington, Health District. He recently completed the work for an M.P.H. degree at Columbia University. Previously, he was Health Officer of King County whose health services have been merged with those of Seattle.

WARREN F. FOX, M.D.,* formerly Health Officer of Riverside County, California, recently became Health Officer of the newly organized full-time health department of the City of San Bernardino.

GEORGE C. GIBSON, M.D., in July succeeded FRANK B. QUEEN, M.D., as Director of the Cancer Control Section, Oregon State Board of Health, Portland. Dr. Gibson recently completed a 2 years' surgical residency at the Pondville Cancer Hospital in Massachusetts.

W. PHILIP PHAIR, D.D.S., became Di-

rector of Dental Health of the Washington State Health Department, Seattle, after receiving his M.P.H. degree at the University of Michigan. MARGARET W. ROBINSON,† Research Assistant for the Research Foundation for Alcoholism, Seattle, Wash., has recently been appointed Executive Secretary of the Foundation.

Deaths

DONALD A. CAMPBELL, M.D.,† Neosho, Newton County Health Officer, Neosho, Mo., Elected Member 1943 (Health Officers Section).

O. R. GILLETTE, M.D.,* City Health Officer of Colorado Springs for 39 years, died in July at the age of 74. (Health Officers Section).

ROBERTS A. HEARN, M.D.,† Staff Physician, American Legion Hospital, Battle Creek, Mich. Elected Member 1943 (Industrial Hygiene Section).

A. W. JONES,* Secretary and Manager, Tuberculosis and Health Society, St. Louis, Mo. Elected Member 1925, Elected Fellow 1934 (Public Health Education Section).

CLEMENTINE J. PRIOR† of Yakima, Wash. Elected Member 1935 (Laboratory Section).

BENJAMIN B. ROBBINS, M.D.,† Health Officer, Bristol, Conn. Elected Member 1927 (Health Officers Section).

WILLIAM M. SILL, M.D.,† Superintendent of Public Health, Jamestown, N. Y. Elected Member 1926 (Health Officers Section).

C. H. WATSON,† Senior Sanitarian, Bannock County Health Unit, Pocatello, Idaho. Elected Member 1943 (Engineering Section).

STEPHEN E. WHITING,* Consulting Engineer of Swampscott, Mass. Elected Member 1935, Elected Fellow 1940 (Industrial Hygiene Section).

Recent Developments in the Treatment of Syphilis*

EVAN W. THOMAS, M.D.

*Departments of Medicine and Dermatology and Syphilology, New York University
College of Medicine and the Department of Medicine and Dermatology and
Syphilology, Third Medical Division, Bellevue Hospital, New York, N. Y.*

VALUES OF PENICILLIN

The advent of penicillin, especially in its new slowly absorbed preparations, has greatly simplified the treatment of syphilis. All stages of the disease can now be treated in a relatively short time with better therapeutic results than formerly. Although penicillin is not a panacea for every case of syphilis, no previous antisyphilitic agent can compare with it in ease of administration, safety, and therapeutic effectiveness. An occasional patient may require the use of bismuth, arsenicals, or fever therapy, but most syphilitics can now be treated satisfactorily with penicillin alone.

At least 2 years of follow-up observations are required for the proper evaluation of any schedule of antisyphilitic treatment; and in spite of careful planning, the optimum time of penicillin treatment for early syphilis has not yet been thoroughly established. When the antibiotic first became available for antisyphilitic treatment in

1943, it was used in aqueous or saline solution. To insure reasonably continuous therapeutic action, individual injections had to be given every 2 to 6 hours, and patients had to be hospitalized. During the war, most cases of early syphilis were treated over periods of from 4 to 8 days, the great majority having been treated for 7½ days. We now have adequate information regarding the optimum total dosage of penicillin for the treatment of early syphilis within 8 days, but the data on more prolonged periods of treatment are still in the process of compilation. The time-dose relationships of therapy with aqueous solutions of penicillin are very different from those with slowly absorbed preparations. The introduction of penicillin in oil and beeswax (POB) made it possible to treat syphilis with single daily injections but most of the data on prolonged follow-up studies of patients treated for early syphilis with POB are on 8 day schedules of therapy. Furthermore, within the past few months, preparations of penicillin which are even more slowly absorbed than POB

given every 2 to 4 hours over a period of $7\frac{1}{2}$ days, a total dose of 2.4 million units has given as good results as 5 million units. Regardless of whether individual injections were given every 2 or 3 hours over a period of $7\frac{1}{2}$ days, the results of treatment of early syphilis at Bellevue Hospital were the same whether the total dose was 2.4 million units or 4.8 million units. The addition of daily injections of 0.04 gm. arsenoxide for 8 days to total doses of from 1.2 million to 2.4 million units of penicillin failed to give significantly better therapeutic results than 2.4 million units alone in $7\frac{1}{2}$ days.

The cumulative "failure" rates for all schedules of therapy of early syphilis with aqueous solutions of penicillin in total doses of from 2.4 to 4.8 million units in $7\frac{1}{2}$ days have been about 20 per cent. The "failure" rates were computed on the basis of the number of patients kept under observation; the "failures" included all cases that had to be retreated because of reinfection, infectious relapse, serologic relapse, and definite seroresistance.

Failure rates of 20 per cent in the treatment of early syphilis are far from satisfactory, but many of the so-called failures were probably reinfections. Therefore, it is impossible to judge the effects of the treatment of early syphilis solely from statistics based on the retreatment of patients. The only satisfactory criterion of a reinfection following rapid treatment of early syphilis is the development of a new chancre at a different site from the original one, and even this criterion was not used in compiling cumulative "failure" rates following rapid treatment of early syphilis. Had it been used, the percentage of "failures" would be somewhat lower, but unfortunately patients can be reinfected following rapid treatment of early syphilis without developing a chancre. Less than 50 per cent of women who are originally infected

with syphilis have chancres which are observed by the patient or examining physician. The appearance of secondary lesions may be the first observed sign of a reinfection in both women and men, and in some cases the only evidence of a reinfection may be a rise in the quantitative serologic tests for syphilis (serologic relapse). Thus, the actual effects of treatment with aqueous solutions of penicillin were undoubtedly better than the statistics indicate. Nevertheless, the treatment of early syphilis with aqueous solutions of penicillin over periods of from 4 to 8 days has not produced maximum therapeutic results, and we have no comparable data on more prolonged periods of therapy with aqueous solutions.

RESULTS OF TREATMENT OF EARLY SYPHILIS WITH POB

Although injections of from 300,000 to 600,000 units of POB do not have to be given more frequently than once a day, the total dosage of penicillin required for the treatment of syphilis over a given period of time seems to have been much the same, whether the penicillin was given in aqueous solution or in oil and beeswax. At Bellevue Hospital in the latter part of 1945 and early months of 1946 we treated over 800 cases of early syphilis with 600,000 units of POB daily for 8 days. One series was treated with two injections of 300,000 units 8 hours apart each day, and another series with single daily injections of 600,000 units. There was no significant difference in the results of treatment in the two series. I have no personal experience with daily injections of only 300,000 units of POB in the treatment of early syphilis but the available data from other sources³ indicate that the cumulative "failure" rates are much the same, whether a total dose of 2.4 or 4.8 million units is given over 8 days. In our series of patients treated for 8 days with 4.8 million units

of POB the cumulative "failure" rates for a follow-up period of 2 years or more are similar to those for 2.4 million units of penicillin in aqueous solution in 7½ days, viz., about 20 per cent.

Data on 15 day schedules of penicillin therapy for early syphilis cannot yet be compared satisfactorily with those on 8 day schedules because of the marked difference in the time of follow-up observations and the varying conditions under which patients were treated.

At Bellevue Hospital we began to treat early syphilis with daily injections of 600,000 units of POB for 15 days late in 1947. The series so treated is not entirely comparable with earlier series because the reservoir of infectious syphilis was appreciably lower in the latter part of 1947 and first half of 1948 than in the preceding 4 years. The chances of reinfection by promiscuous individuals is greater when the reservoir of infectious syphilis is high than when it is low.

But, in spite of uncontrollable variables, a 15 day schedule of therapy for early syphilis now seems superior to one of 8 days. At Bellevue Hospital, of 134 patients treated for early syphilis with 600,000 units of POB daily for 15 days and observed from 4 to 9 months, only 2 have had to be retreated and both of them were probably reinfectd. It is quite possible that daily injections of 300,000 units of POB would have given similar results to 600,000 units daily. Chargin, Sobel, Rein, and Rosenthal⁴ have reported relapses in less than 5 per cent of patients treated for secondary syphilis with 300,000 units of POB daily for 16 days after a follow-up period of from 6 to 10 months.

POSSIBLE SCHEDULES OF TREATMENT OF EARLY SYPHILIS WITH PROCAINE PENICILLIN IN OIL AND ALUMI- NUM MONOSTEARATE

As single injections of 300,000 to

600,000 units of procaine penicillin G in oil and 2 per cent aluminum monostearate give blood concentrations of penicillin for about 4 days, daily injections of this preparation should be unnecessary in the treatment of syphilis. A Committee on Venereal Diseases of the National Institute of Health is now studying the treatment of early syphilis with the following schedules of therapy using procaine penicillin in oil and aluminum monostearate:

1. A single injection of 2.4 million units
2. Weekly injections of 1.2 million units for 2 weeks
3. Weekly injections of 1.2 million units for 4 weeks.

The use of schedule 1 should give results very similar to those obtained by injections of 40,000 units of penicillin in aqueous solution every 3 hours for 60 injections or of daily injections of 300,000 units of POB for 7 or 8 days. The advantages of treating early syphilis with a single treatment are so great from a public health point of view that this treatment should be given careful trial under controlled conditions, but it cannot be advised as yet. The optimum period of treatment for early syphilis now seems to be 15 or more days. Therefore, schedules 2 and 3 are likely to give better results than schedule 1.

Other possible schedules of treatment with procaine penicillin in oil and aluminum monostearate are injections of 600,000 units two or three times a week for 2 to 3 weeks. At least another 2 years or more will be required before we can state with assurance the optimum time during which penicillin should be given in the treatment of early syphilis but at present it does not seem likely that treatment need be given for more than 2 to 3 weeks.

RESPONSE OF SEROLOGIC TESTS FOR SYPHILIS FOLLOWING RAPID TREAT- MENT OF EARLY SYPHILIS

The goal of therapy in the treatment

of early syphilis is cure, with the achievement of seronegativity by all patients. Serologic tests for syphilis (STS), however, do not become negative immediately after treatment. In cases of seropositive primary syphilis about 80 per cent of those satisfactorily treated on our service became seronegative within six months after treatment and of those satisfactorily treated for secondary syphilis only about 60 per cent became seronegative within 6 months after treatment. The remaining 20 and 40 per cent respectively required varying periods before the STS became completely negative. Some patients had small amounts of reagin in the blood for more than 2 years after treatment, but in such cases the quantitative tests became relatively low within 6 months after treatment. The prolonged presence of small amounts of reagin in the blood for many months after treatment for early syphilis does not necessarily mean a continuing syphilitic infection because we found that retreatment did not hasten the reversal of such positive tests to negative and that in the course of time the STS became negative without further therapy unless a relapse occurred.

On our service we made the more or less arbitrary rule that patients who have positive Kahn tests in dilutions of 1-8 or quantitative complement-fixation tests of 15 or more, 9 months after treatment, should be retreated. Very few patients treated for early syphilis will have such relatively high quantitative STS 9 months after treatment unless they have relapsed. Relapse is detected either by the appearance of new early lesions or by marked, sustained rises in quantitative STS from previous levels.

TREATMENT OF RELAPSING EARLY SYPHILIS

At Bellevue Hospital the cumulative "failure" rates of patients retreated for

"relapsing" early syphilis with at least 2.4 million units of penicillin in 8 days have been about 20 per cent. Many of these patients probably had reinfections rather than relapses. In cases of genuine relapse it is advisable to treat over a longer period than 8 days. A few of our patients had to be retreated two or three times for repeated relapses. But none as yet has failed to respond to penicillin, and we have no absolute failures in our entire series, provided repeated courses of penicillin were given. For a first relapse, patients should be retreated with no less than 6 million units of penicillin over a period of at least 15 days. Those who relapse a second time should receive 9 million units over a period of at least 21 days. Rarely it may be advisable to supplement the penicillin therapy with arsenicals and bismuth. In such cases, I believe the treatment with arsenicals and bismuth should be given after the course of penicillin has been completed. This procedure prolongs the therapy and may be more effective than combining the arsenicals and bismuth with penicillin therapy over a period of only 2 or 3 weeks.

TREATMENT OF LATE NEUROSYPHILIS WITH PENICILLIN

Prior to the advent of penicillin, late neurosyphilis was one of the most difficult manifestations of syphilis to treat. Antisyphilitic therapy with heavy metals and arsenicals often checked a syphilitic infection of the central nervous system but it failed to arrest the process permanently in over 50 per cent of cases whether the disease was asymptomatic or symptomatic. In our experience at Bellevue Hospital, fever therapy (malaria or electropreyxia) caused permanent arrest of neurosyphilis, as determined by spinal fluid examinations, in about 85 per cent of cases and, so far, penicillin has proved superior even to fever therapy in the treatment of all

types of neurosyphilis, including general paresis.

During the first three years of trial with penicillin, some investigators⁵⁻¹⁰ reported that fever therapy was superior to penicillin in the treatment of general paresis. They maintained that the best therapy was a combination of penicillin and fever. They based their conclusions on the clinical response of patients rather than on spinal fluid examinations. At Bellevue Hospital, Dattner and I¹¹ have long contended that the most reliable guide to the arrest of a syphilitic infection of the central nervous system is the spinal fluid examination. Following successful therapy, the cells in the spinal fluid should be less than 4 per cu. mm. 3 to 4 months after treatment, and there should be an appreciable fall in increased total protein determinations. Over a prolonged period of observation, the total protein determinations of the spinal fluid should fall to normal, and the colloidal gold and quantitative Wassermann tests should gradually become negative. In some of our malaria-treated cases the Wassermann reactions of the spinal fluid failed to become negative for more than 5 years after treatment but, as long as increased total protein determinations were falling and quantitative Wassermann and colloidal gold tests were declining toward negative reactions, we have not found that further antisyphilitic treatment helped to improve clinical symptoms and signs which are often caused by permanent damage in the central nervous system.

Most investigators¹²⁻¹⁶ have now agreed that the response of the spinal fluid tests following penicillin therapy of neurosyphilis has been as good, if not better than, the response after fever therapy, and numerous authorities have stated that the clinical improvement after penicillin was comparable to that after fever therapy. In England, both

Nicol¹⁷ and Martin,¹⁸ who have had much experience with malaria therapy of general paresis, have reported that penicillin was superior to fever therapy. Nicol says: "One of the most striking clinical features (of penicillin therapy in general paresis) was the physical and mental improvement in many patients."

It must always be recognized that no spirocheticidal agent can replace scar tissue with functioning parenchyma. Consequently, in cases of advanced neurosyphilis it is frequently impossible to restore normal function in spite of the total arrest of a syphilitic infection. Therefore, the spinal fluid tests furnish a better guide to the effectiveness of treatment of neurosyphilis than clinical signs and symptoms.

On the basis of follow-up spinal fluid examinations, 88.3 per cent of 301 patients treated at Bellevue Hospital for various types of neurosyphilis with penicillin alone and followed up for 9 to 48 months had satisfactory results after treatment with from 2 to 9 million units of penicillin given over a period of from 12 to 20 days. Most of the patients who had to be retreated received less than 6 million units of penicillin at the time of their first treatment. So far, only 1 patient has failed to respond satisfactorily after a second course of penicillin. Among the patients who had satisfactory results after penicillin therapy were 5 who had had much previous treatment with malaria therapy, bismuth, and pentavalent arsenicals. As we have observed over 500 patients treated at Bellevue Hospital for neurosyphilis with malaria and electropyraxia in previous years, I have no hesitancy in stating my belief that penicillin has proved superior to fever therapy in the treatment of neurosyphilis, including general paresis.

Schedules of penicillin therapy for neurosyphilis—From our experience at Bellevue Hospital, late neurosyphilis should be treated with no less than 6

million units of penicillin over a period of at least 15 days and preferably 3 weeks. Most of our patients were treated with 40,000 units of penicillin in aqueous solution every 3 hours for 150 injections (19 days). More recently, we have treated neurosyphilis with daily injections of 600,000 units of POB for 15 days. With the use of procaine penicillin in oil and aluminum monostearate, it is probable that injections of 600,000 units three times a week for 3 weeks will give comparable results to 40,000 units of penicillin in aqueous solution every 3 hours for 150 doses.

TREATMENT OF LATE SYMPTOMATIC SYPHILIS OTHER THAN NEUROSYPHILIS

The data on penicillin treatment of late symptomatic syphilis, other than neurosyphilis, are less abundant than on the treatment of early syphilis and neurosyphilis. Nevertheless, except for two reports,^{19, 20} of gummas which failed to respond to penicillin, all types of late syphilis have responded well to penicillin therapy. Of 26 cases of late bone syphilis and cutaneous lesions treated at Bellevue Hospital with penicillin and observed for more than 2 years, all had satisfactory healing and none had relapsed.

To avoid Herxheimer reactions in cases of cardiovascular syphilis and syphilis of the liver, it is advisable to begin treatment with bismuth; but after several weeks of bismuth injections, the treatment can be completed with penicillin. Although the published reports of penicillin therapy of cardiovascular²¹⁻²⁴ and liver syphilis include relatively small series of patients, the results of treatment have been as satisfactory as could be expected.

Schedules of penicillin treatment of late symptomatic syphilis—From the data now available, late symptomatic syphilis, other than neurosyphilis, should

be treated with from 4 to 6 million units of penicillin over a period of not less than fifteen days. If procaine penicillin G in oil and aluminum monostearate is used, injections of 600,000 units two or three times a week for 3 weeks should prove adequate therapy in most cases.

TREATMENT OF LATE LATENT SYPHILIS

By definition, late latent syphilis is asymptomatic; it is diagnosed solely by history and positive STS. The spinal fluid must have been examined in all cases of latent syphilis and found to be normal before the diagnosis can be made.

As the STS do not become negative in most patients treated for late syphilis for many years after treatment, it is difficult to evaluate the effects of therapy in latent cases. Obviously, however, the kind and amount of anti-syphilitic treatment which has proved effective in late symptomatic syphilis should be adequate for the treatment of late latent cases.

In the follow-up of patients treated for late latent syphilis quantitative STS should be obtained at regular intervals. As long as the quantitative tests show a gradual trend toward negative reactions or fail to show marked, sustained rises from previous levels, further anti-syphilitic treatment is not advised. The policy of treating late syphilis, symptomatic or asymptomatic, until the STS have become completely negative cannot be too strongly condemned. At least 70 per cent of patients treated for late syphilis with any known form of antisiphilitic therapy will continue to have positive STS for more than 5 years after treatment, and some will continue to have positive STS for the rest of their lives. To treat patients for late syphilis with the sole purpose of reversing positive STS to negative is a serious error; it involves misrepresentation to the patient because there is

no evidence that continued antisyphilitic therapy will in any way hasten the reversal of positive STS to negative in well treated cases. Late latent syphilis can in most cases be satisfactorily treated with from 4 to 6 million units of penicillin over a period of 2 to 3 weeks.

CONCLUSIONS

1. Penicillin is now the antisyphilitic agent of choice for the treatment of all stages and types of syphilis.
2. So far, the best results in the treatment of early syphilis seem to have been obtained with daily injections of from 300,000 to 600,000 units of POB for 15 days.
3. Procaine penicillin G in oil and 2 per cent aluminum monostearate can now be substituted for POB, and individual injections of this preparation do not have to be given as frequently as with POB. Probably two injections of 600,000 units of this preparation a week for 2 or 3 weeks will accomplish as much as daily injections of 300,000 units of POB for 15 days.
4. Neurosyphilis should be treated with at least 6 million units of penicillin over a period of not less than 15 days and preferably 3 weeks. Injections of 600,000 units of procaine penicillin in oil and aluminum monostearate three times a week for 3 weeks should prove sufficient therapy for most cases of neurosyphilis.
5. For late symptomatic and late latent syphilis from 4 to 6 million units of penicillin should be given over a period of not less than 15 days.
6. In most cases of late syphilis, whether symptomatic or asymptomatic, it is impossible to reverse positive serologic tests for syphilis to negative within 5 or more years. Such patients should be observed after treatment with quantitative serologic tests at regular intervals. Marked rises in quantitative tests from previous levels, sustained for several weeks or months, are an indication for further therapy.

Some Unmet Needs in Tuberculosis Control—A Challenge for the Future*

WILLIAM P. SHEPARD, M.D., F.A.P.H.A.

Third Vice-President, Metropolitan Life Insurance Company, Past President, National Tuberculosis Association, San Francisco, Calif.

THERE appear to be three major unmet needs in tuberculosis control: capital, greater skill, and broader vision.

I. CAPITAL

I wish to speak first of the need for capital, not just money, not donations, not increased budget, but capital for an investment which promises good returns.

Dr. Florence R. Sabin, retiring President of the Western Branch, American Public Health Association, is the latest of our great public health leaders to suggest that the economic aspects of public health work have been insufficiently stressed. Humanitarians as they are, public health workers have been overwhelmed with the enormous human values of saving life and preventing illness. They sometimes forget the money values. We must depend on more or less hardheaded businessmen to support our work. Perhaps it is time we ceased thinking of ourselves as mendicants and assumed the role of investment counselors.

Today in public health and especially in tuberculosis control we have good methods, tested and proved effective over the years; we have professional competence, both administrative and medical; we have organizational competence attested by our results. We have skilled services to offer which will bring rich returns, both humanitarian

and financial. These are items worth buying.

Good Health Is Good Business

Using a recent report of the National Planning Association under the title, *Good Health Is Good Business*, Dr. Sabin^{1,2} has illustrated how the economic aspect of public health may be used to good advantage in our search for capital. I will not repeat all of her figures which will be published soon, or go into detail concerning their derivation. Just let me recite certain high points to illustrate the method.

It is estimated that this country spent about \$174,000,000 in 1943 for the care and control of tuberculosis. When the tuberculosis death rate becomes about one-fourth of its present figure, that is, about 10 per 100,000 per year this expenditure can be reduced to about \$37,000,000, a saving of \$137,000,000, a year. The death rate of 10 per 100,000 will be reached between 20 and 25 years from now at the present rate of decline. It is a reasonable assumption that this time could be speeded up if we greatly increased present effort and expenditure. In fact, some think the death rate might be reduced by three-fourths in 10 years.

In addition to the \$174,000,000 we spent in 1943 for the care and control of tuberculosis, we lost in that year \$348,000,000 worth of goods and services which could have been produced by those now disabled with tuberculosis.

* Presented at the Forty-fourth Annual Meeting, National Tuberculosis Association, New York, N. Y., June 18, 1948.

It is estimated by the National Planning Association that this amount could be reduced to \$35,000,000, a saving of \$313,000,000 a year.

Over and above these staggering amounts, we lost \$229,000,000 in 1943 in the future net earnings of male heads of families who died of tuberculosis that year. It is estimated that this could be reduced to \$22,000,000 a year, a saving of \$207,000,000.

Are we not justified in asking Mr. United States, Incorporated, if he wishes to save the sum total of these amounts; namely, \$657,000,000 a year?

How Much Would It Cost?

Mr. United States, Incorporated, is bound to be interested as would any businessman. His first question is, "How much will it cost?" This, too, is roughly estimated by the National Planning Association as follows:

If in the next 10 years we were to x-ray every inhabitant of this country aged 15 and over twice; follow up all suspects thus found with standard x-rays and complete examinations; follow up all contacts thus found with x-rays and careful examinations, the total cost would be about \$13,560,000 a year.

The National Planning Association estimates the cost of hospital and medical care for the 133,000 patients hospitalized at \$173,000,000 a year.

They estimate the cost of health education over this period as \$12,000,000 a year.

The cost of rehabilitation would come to something like \$22,000,000 a year.

The cost of family relief for the afflicted wage earners would come to something like \$58,000,000 a year.

It is also estimated that \$3,000,000 a year is needed for medical research.

Pensions for tuberculous veterans are assumed to continue at their present rate of \$38,000,000 a year during the 10 years.

The cost of constructing new beds for areas now inadequately supplied is estimated at \$377,750,000 but these facilities would be worth about \$310,000,000 at the end of 10 years, when they might be turned over to other uses, leaving a net cost of about \$6,800,000 a year for a period of 10 years for hospital construction. There are a few other miscellaneous items.

Altogether the National Planning Association estimates that it would cost about \$328,000,000 a year for 10 years to reduce the tuberculosis death rate to something like a fourth of its present level. After that the cost would be reduced to approximately \$37,000,000 a year, much of which would go for research. That is the prospectus for Mr. United States, Incorporated, investor: spending \$328,000,000 to save \$657,000,000. A 10 per cent return in 10 years would be a good investment. This offers a 200 per cent return!

Perhaps the time has come to present this whole matter to the nation as a good business proposition. We may as well face the costs squarely even though they seem astronomical to us. The return can be estimated with some accuracy and Mr. United States, Incorporated, cannot lose.

We may well stress the fact that this type of investment is different from most other expenditures of public funds. For example, expenditures for the police department have only an indirect effect on crime prevention, one much less tangible. Expenditures for fire departments do result in a little more tangible results in fire prevention, but no more tangible than ours. As for hospital expenditures, there is no end to the plea of hospital superintendents for more and better hospitals. Similarly with relief expenditures, we never have enough. The expenditure which we propose, large as it seems to us, is self-limited. Once completed, it will save in one year twice what it cost each year!

This, then, illustrates our need for capital and suggests a method by which the search for an investor may be approached. The figures presented here may not be exact, but the principle of investing a certain amount for a good return is sound. We may not have, at this moment, all the facilities needed in the way of personnel, but given the funds we can soon get them. Mr. United States, Incorporated, may well be interested both as a taxpayer and a purchaser of Christmas Seals.

II. GREATER SKILL

We already have much skill and much knowledge in public health matters and especially in tuberculosis control. We have had almost a half century of experience. We have a smooth working organization internally and externally. Relations were never better within our own organization and with our various state and local organizations. We have proved our adaptability to change.³ We are prepared for the future, whatever may be the developments in a preventive vaccine or an antibiotic for the cure of tuberculosis. We now have the best case finding device yet found in the mass miniature x-ray. We can well be proud of our good results and our outstanding success over the years.

In our field, however, the best is none too good. We cannot be satisfied with anything short of perfection. Public health workers have always been characterized by their interest in evaluating and appraising their work. They find out how well or how ill they are doing, even if it hurts. Few social movements have been more constructively critical of their own methods. We have learned over the years to do things because they work, and to drop things that do not work. This is one of the major reasons for our great strength today and for the gratifying public support accorded us.

In our search for even better methods we must keep certain questions con-

stantly before us. They need not be detailed here, but they include such things as these:

Some Suggestions for Self-Appraisal

Are you using modern methods of health education, or being satisfied with publicity alone? Are you reaching as many groups as you should, especially special racial groups among whom the tuberculosis rate is high? Are you spending as much on special racial groups as their needs justify?

Does your mass x-ray program include careful preliminary educational preparation and follow-up? Is it carefully integrated with and supported by the health department, county medical society, affected industries, and all existing community group leaders?

Is your health department adequately staffed and financed for modern tuberculosis control? If not, what are the reasons and what are you doing about it? Are you familiar with your state and local health department needs in general and exerting every effort to supply these needs through proper legislation and appropriation, bearing in mind that no voluntary agency can control tuberculosis adequately in the absence of a strong health department? Are you aware of your community's overall health needs, beyond tuberculosis control, and actively participating with the health council or other community-wide agency to supply these needs?

Are your practising physicians aware that each and every one of their offices is a case finding center, and does each of them know what community facilities are available for the detection of tuberculosis and the safeguarding of the well?

Is your sanatorium efficiently operated as evidenced by prompt admission, low per cent of recalcitrant patients, high per cent of early cases and cures, reasonable costs? Have you sufficient beds for newly discovered cases?

Do you periodically seek the counsel

CHART 1

DECLINE IN TUBERCULOSIS MORTALITY IN THE UNITED STATES* SINCE 1921

of the National Tuberculosis Association to see what their experience has been with your problems, most of which are common to all associations?

These are but a few of the items of self-appraisal necessary to greater efficiency. Others are available from the Gunn-Platt report,⁴ or from the National Tuberculosis Association.

III. BROADER VISION

Broader vision is our final major need. We have already spoken of our mendicant attitude. To this, perhaps, should be added myopia. The time has come to look farther ahead.

Mortality Trend

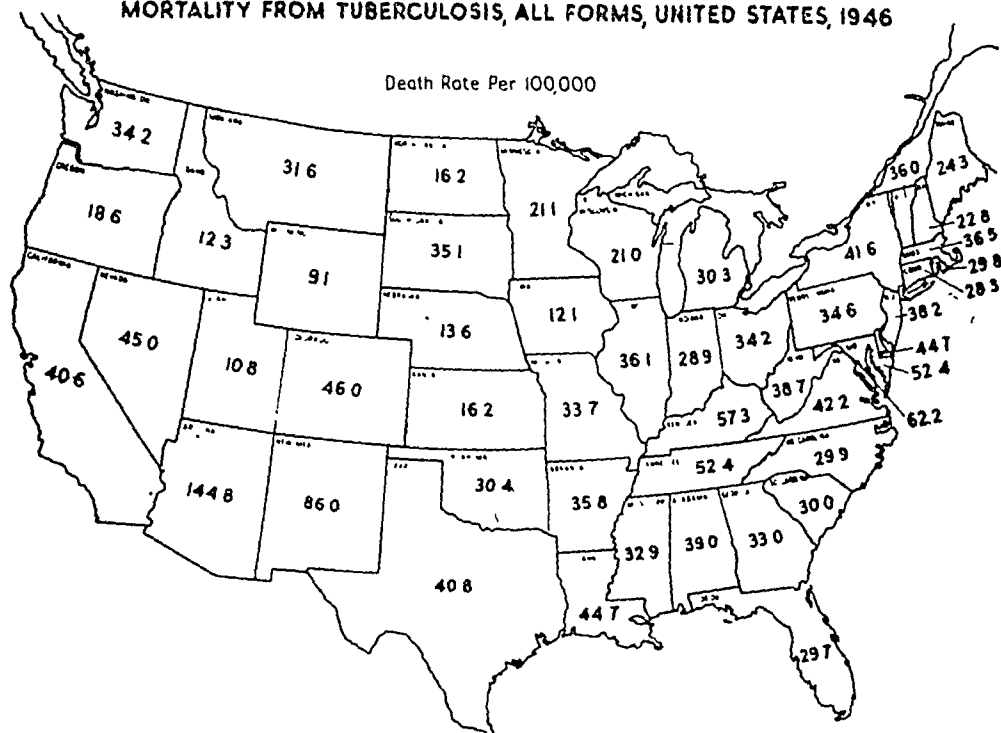

As we look at Chart 1⁵ we see one of the most astounding socio-biological phenomena of man's history. It is not

new, but it helps myopia. This chart happens to go back only to 1921, but it shows our experience with the tuberculosis death rate per 100,000 population for the past 25 years. If it went back 75 years more, it would show approximately the same steady downward trend. Note where the trend line finishes in the year 1965 when tuberculosis mortality in this country will be less than 20 per 100,000 per year. Already it is below 40. If this trend continues, the death rate will be less than 10 in from 20 to 25 years.

The matter is even more urgent. If you will look at Chart 2⁶ where 1946 death rates by state are displayed, you will see that the national death rate is heavily weighted by a few states at the top of the list whose rate is excessive. Actually, there are already 35 states out

CHART 2

MORTALITY FROM TUBERCULOSIS, ALL FORMS, UNITED STATES, 1946

of the 48 having death rates below 40 per 100,000 population. There are 17 states having death rates below 30, and 8 states having death rates below 20. Indeed, tuberculosis is already a very minor cause of death in Nebraska, Idaho, Iowa, Utah, and Wyoming, where it kills fewer than 15 per 100,000 per year.

Chart 3⁷ shows what we mean by minor causes of death. Note the enormous death rates from heart disease and cancer as compared with tuberculosis even today. Where will the tuberculosis rate be in 10, 20, and 40 years from now? Where will the National Tuberculosis Association be 20 and 40 years from now?

We, of the National Tuberculosis Association, have been told before that 3 choices confront us: liquidate, curtail, or expand.⁸ Before deciding this question, let us take a quick review of our

assets again and then look at our liabilities.

Shall We Liquidate These Assets?

Among the assets we have some 3,000 local associations. They have about 50,000 board members. We employ about 1,500 trained workers on a full-time basis, many of them with years of experience, well trained by that experience and by academic qualifications, their competence improving daily. There are at least 250,000 people in this country who are in some way connected with the tuberculosis control movement in a voluntary capacity, donating varying amounts of their valuable time, doing it for the cause, not for personal gain.

We have knowledge of community organization, of health education, and public health administration. We have experience and some skill in influencing

CHART 3

LEADING CAUSES OF DEATH, 1900 AND 1946

legislation in the right direction and in obtaining appropriations where it seems reasonable to ask the taxpayer to support portions of the tuberculosis control work. We have learned the proper role of the voluntary agency in relation to the tax-supported agency and in relation to other agencies in various health fields. We have shown our adaptability by changing direction as new scientific developments appear. We have outstanding public support and a fund raising device which is unparalleled. As workers in the public health field we have full knowledge of the proper use of the various specialists in this field; such as nurses, statisticians, health educators, physicians, and so forth.

Can We Liquidate These Liabilities?

Among our liabilities we have already spoken of lack of capital and our desire

for even greater skill. The only other serious liability is our past failure to recognize 3 facts:

1. We have never controlled tuberculosis without attention to the general health needs of the community. We have always worked with health departments, with schools, with the problems of nutrition, health habits, need for medical care and hospitalization, the special aspects of industrial health, the importance of medical education, and the great importance of research.

2. We do health education, not solely tuberculosis education.

3. We can rather easily turn our skills to other fields, once tuberculosis control is well in hand.

Altogether we appear to be a healthy, going concern. Assets far outweigh liabilities. There is still great need for our services. Liquidation and curtailment are out of the question. Our only choice is to expand.

Exploring the Possibilities of Expansion

In what direction might the N.T.A. logically consider expansion? Time will not permit discussion of all the possibilities, but the following are some of the most intriguing:

Local Health Councils

We are beginning to realize that, regardless of the headquarters structure of the national health agencies and their interrelationships with each other, they flourish only by rendering service locally. They are the flower of the roots arising in the grass—a lesson we in the tuberculosis field learned long since. These roots only flourish when fertilized by local service.⁹

Each community has its own health problems, many of them like other communities, a few of them unique.

The solution of these problems must be reached locally by local people, not by imposing a program from the top. Local groups dedicated to the solution of health problems must be autonomous.

Because of these conditions, and thanks to the pioneering of a few well established local health councils, many such councils are being formed with surprising rapidity throughout the country. They consist of representatives of all health agencies, both official and voluntary, in a given community and are dedicated to the study and solution of all community health problems. With increasing frequency they seek expert advice from the national agencies, sometimes on social hygiene, again on tuberculosis, again on cancer, and so forth.

In many places the local tuberculosis association is virtually a health council, or at least is in a key position to activate and implement one already existing. It has been a valuable experience for our local tuberculosis associations to learn to facilitate their cooperation with other health agencies. We are learning, as are other members of these local health councils, that credit for an accom-

plishment is a secondary matter and that credit can best be shared with many. Paul de Kruif quotes J. W. Livingston as saying, "You can get anything done if you don't care who gets the credit."

Active participation in, and financial and moral support of, local health councils would seem a modern, proper, and legitimate use of our funds and personnel.

Heart Disease

Heart disease is more important than tuberculosis economically, socially, and from the health standpoint. It already imposes a greater burden on our populace than does tuberculosis. It is a field in which we have a legitimate interest since we can hardly examine or x-ray human chests without at least considering the heart. There are a striking number of similarities between the heart disease control program and that of tuberculosis control. These are especially startling in the field of acute rheumatic fever, now a leading killer among children.¹⁰ In several localities and in some states we already have a good start toward combining the tuberculosis and heart disease control movements. This, too, would seem a legitimate and proper way to direct our energies.

Chronic Illness

If we segregate the entire problem of chronic illness, including as it does heart disease and tuberculosis, we are appalled at its size and seriousness. It is an enormous burden which grows heavier as the population ages. Little is being done about it. It is a field with which we are not unfamiliar, since tuberculosis is usually a chronic disease. The recently published joint statement on "Planning for the Chronically Ill," issued by the American Hospital Association, the American Public Welfare Association, the American Public Health Association, and the American Medical

Association,¹¹ is well worth careful study. It points out the need for more institutional care, a field in which we are well versed. Incidentally, it presents the possibility of using tuberculosis sanatoria when they are virtually empty in the not too distant future, for the care of the chronically ill. The report points out the need for more medical care, a field in which we have been blessed by the whole-hearted coöperation of the medical profession for many years.

The report says there is a hopeful side to the problem of the chronically ill in the field of rehabilitation; again, a field in which we have had considerable experience. There is great need for more home nursing care. We know where to get and how to use public health nurses. Altogether, this field of chronic illness looks like a great and impressive challenge and one in which we are not inexperienced or without skill.

Maternal and Child Health

Since the demise of the American Child Health Association in 1935, there has been no great national organization prepared to render service through local affiliates in the field of maternal and child health. The recent nation-wide study of child care facilities made by the American Academy of Pediatrics discloses surprising deficiencies in this nation's care of its children.¹² The infant and maternal death rates are still distressingly high in many places, and in the very places where modern medical and hospital care are lacking. It will take all the power of an aroused and informed public to remedy these deficiencies. Again, we have experience and ability in helping localities discern and remedy their health problems, and in working with organized medicine. The Academy of Pediatrics will need some such support as ours if results are to be obtained with a minimum of delay.

School Health

With but few exceptions, the school health field remains in a distressing state. Relatively few schools have sufficient numbers of school physicians, nurses, and teacher-health-specialists to do more than a token job of what we know how to do. Physical defects, many of them correctable, are overlooked or neglected in an appalling number of school children. We have learned from the Astoria studies and a few other places how to do effective health work in schools. We have the support of the education profession. We are lacking in public health personnel which is specially trained for school work.

Tuberculosis associations have had a long and fruitful partnership with the schools. We have often subsidized school nurses and physicians. We are accustomed to dealing with boards of education. We know how to prepare good health teaching material. This challenge might well engage us.

Personnel Training and Placement

The public health progress of the nation is seriously impeded by lack of competent personnel. In no area is this more apparent than among the voluntary health agencies. We have the oldest and best organized personnel training and placement program of any of the national voluntary health organizations. We have been giving in-service training for years. We have recruited, trained, placed, and replaced competent personnel for our locals. We are in touch with the accredited schools of public health and know how best to use them to supplement our needs. If we did nothing else new but to further develop our personnel training facilities for ourselves and the other health agencies, we would render a great service.

Other Special Problems

I need not go further than to leave

these few illustrations of some directions in which we might turn our attention. Others are the field of cancer control, of mental hygiene, and diabetes. In each of these we bring some special skill and meet a challenge worthy of our mettle.

Fund Raising and Interrelationships

It is at the point of fund raising and the interrelationships of various agencies that our best plans are likely to fail. With our great propensity in this country for voluntary organization we often over-organize to the detriment of the cause to which we are dedicated. Disagreements over internal administration, fierce interorganizational jealousies, complications, overlapping, and duplication unfortunately occur. Thus, sometimes we see the absurd spectacle of the individual suffering needlessly while the experts argue over which is to help and how.

Let us start by looking at the average town or city and the average individuals in it. It is safe to assume that this average "Midtown" needs good sanitation, tuberculosis control, venereal disease control, cancer deaths reduced, something done about heart disease, all the protection there is from polio, modern facilities for mental hygiene, prevention of blindness, prevention of deafness, and so forth. It is also safe to assume that much the same people are laboring to meet these needs in each of these average "Midtowns." They are the public spirited, generous, socially minded people who are your board members or someone else's, or who work for the Community Chest, or the League of Women Voters, or the Parent-Teacher Association. It is also pretty much these same people who do the fund raising, first for one cause, then the other.

It is on fund raising for so many worthy causes that they weary. They are justly entitled to relief. We must spare their energies and conserve their

interest. There has been some thought that we might be able to finance the national voluntary health agencies in a combined or federated fund raising drive similar to that of the War Chest. I do not believe this can be done at present.

It is the inalienable right of the free American citizen to give to whomever he pleases and for whatever purpose interests him. One will give generously to tuberculosis because of personal experience. Another is more concerned with cancer or diabetes or heart disease. The reasons for each one are his own and he is entitled to them. He is not interested in a nebulous, anonymous cause called public health. Therefore, he will be less generous with any plan of federated fund raising except when it can be placed under one great cause, such as the War Chest. The experience of the Community Chests has proved this. They have, on the whole, collected less in their communities than would have been collected by each agency separately with separate fund raising drives.

To be sure, the individual donor may be annoyed with multiple drives, but so is he annoyed with the rival advertising claims of the virtues of 20 different automobiles, or soaps, or cereals. Nevertheless, he enjoys the freedom to choose his own brand of car. He takes greater pride in it because he picks it. So it is with his donations. Annoyed though he may be, it is his birthright in a democracy to make a free choice. Our job is telling him frankly what is needed, why, what his dollar will do, and keeping him informed on what his past dollars have done. He is also entitled to know that we use his money economically and with the greatest possible efficiency.

Is it too much to anticipate that the time may come when:

1. Tuberculosis associations will have the Great White Plague practically conquered, though continuing to hold the fort through permanent application of control measures and ever more generous support of research.

2. Tuberculosis associations will be playing a leading role in local health councils throughout the country, both financially and in terms of service. In some places they may actually become local health councils by having expert medical advice on various health problems other than tuberculosis and special board committees on such problems. In other places they may become the major financial and staff support of existing health councils.

3. Tuberculosis associations will be changed to tuberculosis and health associations and tell the public frankly what they are doing in the other challenging fields of public health.

4. Christmas Seals will be offered as usual, but for various purposes, and other appeals made to the same mailing list during the year, now for one purpose and again for another.

5. We say to the public something like this, "You have helped us conquer tuberculosis through your generous support over the years. It could easily become a great menace again, hence we need your continued support to hold our gain."

"The lessons we have learned and the skill we have developed in tuberculosis control can now be turned partly to other fields where the need is great."

"Please send the amount you would like us to devote to tuberculosis now. Later in the year we will give you an opportunity to help us with heart disease control (or cancer, diabetes, etc.)."

The amount sought and its proposed use will depend upon *local* needs, discerned by *local* people, and used *locally* except for a reasonable percentage for the particular national agency whose services are needed. The amount sought will not be a "quota" demanded by a national agency. Its use will be for a program constructed locally, not "imposed" by the national. The local agency will be wise to consult the national in order to take full advantage of its expert knowledge and broad experience. Thus, the national earns its percentage by rendering local service.

Is this too much to hope for? With our 50 year record of success in community health leadership, I do not believe it is.

Such a plan need not affect the existing structure of the national health agencies. They should be supported by a modest percentage of local funds collected, just as the National Tuberculosis Association is supported. They would continue to explore, develop and imple-

ment the best possible methods in their fields and be ready to offer them to local units as requested. Their experts would be available to locals at any time. They would continue studies of the overall national health problems and continue to integrate their work with the national government agencies. Their fund raising would be confined to the large donors, corporations, and individuals who wish their money used nationally. Finally, they would integrate their work with each other more closely through the National Health Council, just as we shall all soon be doing through local health councils.

There is a continuing need for various independent national health agencies, with separate fund raising campaigns, though closely coördinated through the National Health Council.

On the local basis, there is logic and economy in a single voluntary health organization, either a local health council with branches, or a tuberculosis and health association with committees of the board and divisions of the staff covering various fields. Incidentally, diagrams of such a plan were worked out for the National Health Council by Armstrong in 1921 and 1922 and encouraged by Dr. Linsley Williams, then Managing Director of the National Tuberculosis Association.

IV. SUMMARY

The future never presented more important challenges. Our unmet needs may be classified under Capital, Greater Skill, Broader Vision. Capital will be forthcoming as our work becomes better recognized as a good investment and as we develop courageous business methods. Greater Skill is inevitable with continued self-appraisal and sharing of experience. Broader Vision is urgent since it will lead to greater service, better health, and prolonged lives for all.

There is no thought of abandoning

tuberculosis control. We know this adversary well enough to realize that it will threaten us again in war or famine. We are strong enough now, however, to hold our tuberculosis gains while we attack new enemies which are destroying our people.

Physical Disability: A National Problem

HOWARD A. RUSK, M.D., AND EUGENE J. TAYLOR

*Department of Rehabilitation and Physical Medicine, New York University
College of Medicine, New York, N. Y.*

THE lack of a systematic approach requiring the reporting of cases of physical disability to a central agency, together with varying subjective interpretations of "what constitutes a handicap," makes it difficult to stake out the boundaries of the field of rehabilitation and services to the handicapped in any quantitative fashion.

Although a census of such conditions has been proposed on several occasions (legislation calling for an exhaustive census of the physically handicapped was introduced in Congress by Senator Johnson of Colorado on March 15, 1948¹), there has never been a complete survey of the extent of disability in the United States. The most comprehensive source of information at present is the National Health Survey, conducted by the U. S. Public Health Service in 1935-1936.² In this survey, 800,000 families in 83 cities and 23 rural areas of 19 states were studied. The reliability of this study has been demonstrated in other extensive surveys on the extent of chronic disease and crippling conditions,³⁻⁷ and although results are not

strictly comparable, due to different methods of enumeration, they bear out the fact that the National Health Survey is probably the best source available for such statistics, although later studies indicate that its results are conservative.

Regardless of the inadequacies of existing yardsticks, numerous requests for statistics on the extent of disability have made a compilation of the following known existing data seem advisable.

ORTHOPEDEICALLY HANDICAPPED ADULTS

In the National Health Survey, an orthopedic impairment was defined as "a permanent handicap which has been depriving the afflicted person of the natural use of some portion of his skeletal system. The term 'skeletal' has reference to the tissues of the bones, joints, and the neuromuscular mechanisms concerned with the functions of the tissues. In detail, it refers to lost, crippled, paralyzed, or deformed individual members of the body."⁸

It was reported that the estimated number of persons in the United States

TABLE 1
Estimated Orthopedic Impairments—1940

| Ages | Males | | Females | |
|----------|------------------------|----------------|------------------------|----------------|
| | Orthopedic Impairments | | Orthopedic Impairments | |
| | Non-disabling | Incapacitating | Non-disabling | Incapacitating |
| Under 15 | 79,700 | 13,200 | 53,500 | 12,500 |
| 15-24 | 145,000 | 13,300 | 68,700 | 12,300 |
| 25-44 | 310,100 | 35,600 | 150,700 | 24,100 |
| 45-64 | 594,100 | 76,500 | 190,300 | 34,100 |
| Over 65 | 336,400 | 69,900 | 163,300 | 49,500 |
| Total | 1,636,100 | 208,500 | 626,500 | 132,500 |

[1381]

with orthopedic impairments in 1940 was 2,603,000, of whom 341,000 were afflicted with incapacitating impairments, and of whom 1,844,600 were males and 759,000 were females.⁹

The distribution of these cases by sex, age, and degree of incapacity is indicated in Table 1.

The annual incidence of new cases of orthopedic impairments was estimated at 94,440¹⁰ distributed by sex, age, and extent of incapacity as shown in Table 2.

Kessler has estimated that on the basis of the 1940 census, there were approximately 2,000,000 disabled adults, exclusive of the war disabled, the chronically ill, the blind, the deaf and the hard of hearing.¹¹

During the period of November, 1941, to August, 1945, 4,828,000 registrants for Selective Services between the ages of 18 and 37 years were rejected for military service. Of this group, 510,000, or 10.6 per cent, had manifestly disqualifying defects; 367,000, or 7.6 per cent, had musculoskeletal defects; and 235,400, or 4.9 per cent, neurological defects.¹²

THE AMPUTEES

The number of amputees in the United States has been variously estimated at from 500,000 to 2,000,000. The most generally accepted figure, including amputations of all types, is approximately 900,000, with an annual increment of 75,000.¹³ The number of major amputations has been estimated at

400,000 with an annual increment of 40,000.¹⁴

According to the National Health Survey, it was estimated that in 1940, 673,200 persons had lost one or more toes, 65,700 persons had lost one hand or arm, 114,800 persons had lost one foot or leg, and 11,600 persons had lost two or more major members (both hands; both feet; or one or both hands and one or both feet).¹⁵ It must be noted that these figures do not include estimates of limbs lost by men in military services during World War II, approximately 20,500 of whom had major amputations,¹⁶ or of injury due to the great industrial activity associated with the war (it has been estimated that 65,000 war workers had major amputations as a result of accidents).¹⁷

CRIPPLED CHILDREN

Prior to the White House Conference on Child Health and Protection in 1930, the usual figure given for the ratio of crippled children was 2.5 per 1,000. Kessler, in later studies, estimated the ratio to be 3.72.¹⁸ The Committee on the Physically and Mentally Handicapped of the White House Conference reported that there were 368,325 crippled children in the United States in 1933,¹⁹ or 3 per 1,000. In 1944, there were 373,177 registered crippled children according to the Children's Bureau.²⁰

Reliable statistical surveys on the in-

TABLE 2

Annual Incidence of New Orthopedic Impairments

| Ages | Males | | Females | |
|----------|------------------------|----------------|------------------------|----------------|
| | Orthopedic Impairments | | Orthopedic Impairments | |
| | Non-disabling | Incapacitating | Non-disabling | Incapacitating |
| Under 20 | 11,630 | 1,160 | 5,920 | 1,050 |
| 20-39 | 19,750 | 890 | 2,540 | 300 |
| 40-54 | 10,560 | 2,330 | 4,350 | 740 |
| 55-64 | 7,400 | 2,500 | 4,320 | 1,120 |
| Over 65 | 6,190 | 2,850 | 6,020 | 2,520 |
| Total | 55,530 | 9,730 | 23,150 | 6,030 |

cidence of cerebral palsy have been very meager, and most references are based on the published reports of Phelps.²¹

Phelps has reported an annual birth incidence of 7 per 100,000 total population, 15 per cent of whom die in the first 5 years of life.²² This would mean that the total number of cases in the United States based on a life-expectancy of 50 years would be approximately 336,000. At the present time, there are some 40,000 such children listed on state crippled children's registers, but the U. S. Children's Bureau estimates there are 175,000 such children in the nation.²³

POLIOMYELITIS

As with other types of disability statistics, it is difficult to estimate the extent of disability resulting from poliomyelitis. The number of cases reported in 1945 was 13,514, as compared with 19,029 in 1944; 12,450 in 1943; 4,033 in 1942; 9,068 in 1941; 9,826 in 1940; 7,343 in 1939; and 1,705 in 1938. "Cases reported," however, means only the cases which have come to the attention of the health authorities. In some states, only paralytic cases are reported; in other states, non-paralytic cases are included.²⁴

A sampling survey of approximately 1,900,000 men examined for selective service registration from April, 1942, to December, 1943, indicated that 6 out of each 1,000 showed definite signs of having had infantile paralysis sometime during their lives.

It is estimated that of infantile paralysis victims in this country, 50 per cent recover completely, 25 to 30 show light residual paralysis, 15 to 20 per cent show marked residual paralysis, and 5 to 10 per cent die.

EPILEPSY

Estimates on the number of persons in the United States subject to convulsive disorders vary from 1/2 million to

1 1/2 million.²⁵ As there is no standard method of determining disability, there are no figures available on the number of persons disabled by epilepsy, but approximately 50,000 such persons are institutionalized.²⁶

DISEASES OF THE HEART AND ARTERIES

It is estimated that, in the United States, there are between 9,000,000 and 10,000,000 persons suffering from diseases of the heart and arteries,²⁷ and where surveys have been conducted, from 0.3 to 6 per cent of the childhood population and 0.6 to 1 per cent of the young adult population have been found to be afflicted with rheumatic fever.²⁸ In a further study of 1,000 children followed for a period of 10 years after an initial diagnosis of rheumatic fever, it was found that 344 had been forced by residual heart disease to limit their activities; 135 of these were so incapacitated that they were forced to lead a sedentary existence, and 209 were restricted, in that they could not participate in competitive sports.²⁹

Of the 4,828,000 men between the ages of 18 and 37 rejected by Selective Service from November, 1941, to August, 1945, 317,000, or 6.6 per cent, were disqualified because of cardiovascular difficulties.³⁰

DIABETES MELLITUS

It is estimated that there are from 725,000³¹ to 1,000,000 known diabetic persons in the United States, and another 1,000,000 who are unknown.³²

TUBERCULOSIS

It has been estimated that the number of clinically significant, active cases of tuberculosis in the United States is approximately 300,000.³³ Because of varying interpretations of the need and efficacy of rehabilitation of the tuberculous, the lack of rehabilitation facilities, and the lack of any objective standards for the functional capacities of the

ex-tuberculous, there are no figures on the number of persons in the United States needing rehabilitation following tuberculosis. Siltzbach has estimated that "upward of 60,000 persons of the 'good chronic' infective group in the United States are eligible for and could derive benefit from employment under sheltered conditions," and states that the total number of patients, nationally, requiring rehabilitation services is approximately 150,000.³⁴ In 1944, Emerson estimated that three-fourths of all those stricken with tuberculosis would, at some time, need rehabilitation services.³⁵

THE ACOUSTICALLY HANDICAPPED

In common with most types of disabilities, there are no accurate statistics on the number of acoustically handicapped persons in the United States. Estimates of the number of persons who suffer a hearing loss (ranging from a slight loss to almost total deafness) range from 7,000,000 to 14,000,000,³⁶ while an estimated 800,000 persons wear hearing aids³⁷ as compared with an estimated 1,600,000 who need them.³⁸

Estimates of the number of hard-of-hearing children range from 2 to 12 per cent of the population up to a figure of 3,000,000.³⁹ The Office of Vocational Rehabilitation has estimated that there are at least 33,000 deaf civilians and 206,000 who are hard-of-hearing who are eligible for services from state vocational rehabilitation agencies.⁴⁰ During the 1947 fiscal year, the federal-state vocational rehabilitation agencies rehabilitated 954 deaf men and women, and 2,439 who were hard-of-hearing.

During the war years, 13,000 service men were given aural rehabilitation in Army and Navy centers.⁴¹ On January 10, 1947, 42,191 veterans of World War II were receiving disability compensation payments for disease and disabilities of the ear, while 16,594 (as of March 4, 1947) service-connected and

1,077 (as of March 23, 1947) non-service-connected compensation claims for such disabilities were being paid World War I veterans.⁴² The Veterans Administration has stated that within 20 years, the number of World War II veterans needing aural rehabilitation may be expected to increase to 200,000.⁴³

THE VISUALLY HANDICAPPED

The most generally accepted figure on the number of blind in the United States is 230,000,⁴⁴ with an annual incidence of new cases of blindness at 6.6 per 10,000 population.⁴⁵

As of January, 1948, the number of blind children enrolled in residential schools or classes for the blind was 5,876. Of these, 5,344 were in residential schools, and 532 in braille classes in public schools. There are no reliable statistics available on the number of blind children outside residential schools and classes for the blind, but the best estimate on the total number of blind school age children in the United States is about 10,000.⁴⁶

Because of varying interpretations and legal definitions of "visually handicapped," or "partially seeing," figures vary on the number of such persons in the nation. It is estimated, however, that there are some 9,000 children at present in 620 special classes for the visually handicapped in 221 cities, and that some assistance is given to a small number of such children in rural areas. The total number of children in need of such special services has been estimated at 50,000.⁴⁷ Estimates have been made by Hathaway that one child in every 500 should be included in this group.⁴⁸

DISORDERS OF SPEECH

There are no accurate figures on the number of adults with speech disorders, but it has been estimated that approximately 10 per cent of all school children in the United States have some form of

speech difficulty, and that in 5 per cent, the disorders are of a serious or complex nature.⁴⁹ The White House Conference of 1930 reported that 1,000,000 school children between ages 5 and 19 had speech disorders sufficiently severe as to require treatment, and noted that this did not include those who left school before the age of 18.⁵⁰ Numerous school surveys have indicated that at least 3 to 5 per cent of all school children have speech disorders serious enough to demand special assistance.

SUMMARY

Although reliable statistics and data on the numbers of disabled are incomplete, there is certainly sufficient information to conclude that (1) the totals are tremendous, (2) the rehabilitation needs of but a small percentage are being met, and, (3) in most instances those needs could be met more effectively. A scientific enumeration of the total number of disabled in the nation would be helpful for future planning, but our primary efforts could profitably be directed toward providing more and better services for the millions of cases already known.

The Participation of Puerto Rico in the Federal Health and Hospital Program*

E. GARRIDO MORALES, M.D., DR.P.H., F.A.P.H.A.

*Hospital Administration Consultant, U. S. Public Health Service,
San Juan, Puerto Rico*

THERE is perhaps no other community under the American flag where there is greater need for health and hospital facilities than the Island of Puerto Rico. An extremely high population density, together with a peculiar socioeconomic structure and a tropical environment results in widespread unemployment, comparatively low wages, low standards of living, and a high incidence of disease, notably diarrhea and enteritis, tuberculosis, hookworm, and malaria.

The seriousness of these health problems is evident if we realize that during the past several years diarrhea and enteritis and tuberculosis, 2 preventable diseases susceptible to control measures, have been responsible for approximately one-third of the total number of deaths registered on the Island. Out of a total of 27,570 deaths from all causes recorded on the Island during the year 1946, 4,697 were certified as diarrhea and enteritis and 4,317 were reported as caused by tuberculosis. Maternal and infant mortality is higher in Puerto Rico than in comparable communities in continental United States. Only 20 per cent of the total births recorded on the Island during the fiscal year 1947 occurred in hospitals and 71 per cent of the total deaths registered during the year 1946

were certified by physicians without attendance for the last illness.

Intestinal parasite infestations are extremely common, especially in mountainous districts of the Island, and although it is generally accepted that the severity of infections has decreased as a result of sanitation and treatment programs sponsored by the Insular Health Department during the last 25 years, the proportion of infected persons remains extremely high. Malaria is endemic and, although there has been a considerable reduction in the mortality rate as well as the parasite index during the last 15 years, the disease still remains as a major public health problem since there are numerous anopheline breeding areas which are potential foci of infection.

Although there are few reports on the incidence of syphilis in Puerto Rico, it has been estimated that approximately 10 per cent of the urban and 5 per cent of the rural population have a positive serology, presumably of syphilitic origin. Out of 32,000 blood specimens examined from selectees on the Island during World War II, 12.8 per cent showed a positive serology.

According to the Organic Act of Puerto Rico approved by the United States Congress during the year 1917, the Commissioner of Health is in charge of all matters pertaining to health and charities on the Island. In harmony

* Presented before the Seventh Annual Meeting of the Puerto Rico Public Health Association held in San Juan, Puerto Rico. February 11, 1948

with the provisions of the Organic Act, the Insular Department of Health has 3 divisions, namely: Public Health, Hospitals, and Public Welfare.

It is an accepted fact that provision of health services under full-time medical officers is a fundamental need of every community. During the year 1926, the first full-time health unit was organized in the municipality of Rio Piedras. By 1938 the entire population of the Island covering 76 municipalities was served by health units under full-time medical officers. A program of rural medical dispensaries, which was being operated by the Puerto Rico Reconstruction Administration, was transferred to the Insular Department of Health during the year 1938 and a total of 33 dispensaries were operated during the fiscal year 1941, and 55 during the fiscal year 1942. At the present time the Insular Health Department operates 76 health units out of which 51 are in rented buildings; 10 sub-units in urban communities, out of which 7 are in rented buildings; and 83 rural medical dispensaries, out of which 5 are in rented buildings. A total of 22 tuberculosis clinics for diagnosis and ambulatory pneumothorax treatment are operated as a part of the health unit program.

During the past 10 years the U. S. Public Health Service has been carrying out coöperative programs through grants-in-aid to the Insular Health Department for the solution of many health problems, particularly venereal diseases, tuberculosis, and general health. Programs related to maternal and child health, child welfare, and aid to crippled children are being carried out in coöperation with the U. S. Children's Bureau, which functions under the Federal Security Agency.

Funds made available to the Insular Health Department during a period of 10 years, totalled \$84,752,776 out of which \$4,588,675 were allotted by the

U. S. Public Health Service for General Health, Venereal Diseases, and Tuberculosis Control. Beginning with the fiscal year 1944, approximately one-third of these funds are expended for public health, one-third for hospital care of the indigent, and one-third for public welfare.

The employment of trained personnel is essential to the success of any public health or medical care program. Unfortunately there are not enough physicians, registered nurses, laboratory technicians, sanitarians, health educators, and other technical personnel to carry out the medical and public health work that is needed on the Island but this is also true to some extent on the Continent. Progress, however, has been made and the provision of fellowships by the University and the Insular Department of Health, together with the establishment of a department of public health for graduate training at the School of Tropical Medicine, are steps forward in the right direction.

The per capita income in Puerto Rico is extremely low as compared with similar communities in the Continental United States. According to a survey carried out by Mountin, Pennel, and Flock¹ during the year 1935, 90 per cent of a representative group, including 6,000 families in Puerto Rico, had an income of less than \$500 per year while only 4 per cent earned \$1,000 per year or more. The average annual income per family was estimated to be approximately \$230. Another survey conducted during the year 1941 among 2,000 rural and urban wage earners' families scattered throughout the Island revealed that the average annual income per family was \$341. The 1941 study was sponsored by the Insular Department of Labor and the Works Progress Administration. Although it is believed that these incomes are higher at the present time, the fact still remains that the great majority of the people on the

Island cannot afford to pay for medical services, including hospitalization.

With the exception of mental, tuberculous, and contagious patients, which are cared for in Insular institutions operated by the Department of Health, the care of the indigent sick has been a responsibility of the different municipalities. During the year 1935, a survey carried out by the U. S. Public Health Service revealed that the Insular Health Department operated a psychopathic hospital for 1,000 patients, 4 tuberculosis hospitals with a capacity for 1,400 beds, a contagious hospital for 50 beds, and a leper colony for 90 patients.

The survey revealed that the type of medical services rendered by the great majority of the 76 municipalities of the Island was not in accordance with modern medical practice. Data collected showed that during the year 1935 there were 97 general hospitals with a capacity of 3,588 beds on the Island. Out of this number, 61 with 2,017 beds were owned by municipal governments, 2 with a capacity of 130 beds were owned by the Insular Government, and 34 with a total of 1,441 beds were private. Out of a total of 76 municipalities on the Island, with a population of approximately 2 million people, 61 owned municipal hospitals, 7 of which were not used for the care of patients and 15 did not have a hospital building. First-class municipalities operated 5 hospitals with a capacity for 757 beds, 22 second-class municipalities operated hospitals with a capacity for 718 beds, and 34 third-class municipalities operated hospitals with a capacity for 542 patients.

Expenditures for all purposes in the 76 municipalities during the year 1935 totalled \$5,594,545, out of which \$2,705,320 was expended by five first-class municipalities, \$1,760,316 by 22 second-class municipalities, and \$1,128,907 by 34 third-class municipalities. First-class municipalities used 18.1 per

cent of their total expenditures for medical care as compared with 19.8 per cent and 16.5 per cent of total expenditures, respectively, used by second- and third-class municipalities for the same purpose.

There was no x-ray or clinical laboratory in any of the hospitals located in third-class municipalities. Out of 22 hospitals located in second-class municipalities, 4 had some laboratory facilities and only 1 had x-ray equipment. Three out of 5 hospitals located in first-class municipalities had laboratory equipment and 4 had x-ray machines. Kitchen and laundry equipment were inadequate for the demands in municipal hospitals of all categories.

During the year 1935 there were 131 physicians employed by municipalities for the care of the indigent sick out of a total of 436 registered on the Island. Only 87 graduate nurses were employed in the medical care program of these municipalities.

According to a survey conducted by the Insular Health Department during the latter part of the year 1947, there were 1,298 beds for the care of mental patients, 2,254 beds for the care of tuberculosis patients, and 6,753 beds in general hospitals on the Island. Out of the total mental beds, 1,000 are government owned and 298 are private. Out of the total beds reported for tuberculosis patients, 1,892 are owned by the Insular Government and 362 are in private hospitals. There have been no additional beds provided for the care and treatment of mental patients since the year 1929, and only 400 additional beds at the Cayey Hospital, which has not begun to operate, have been provided for tuberculosis patients since the year 1935. A preventorium for approximately 100 beds was converted into a sanatorium for children of school age during the year 1942.

General hospital beds operated by the Insular Government increased from

130 in 1935 to 1,287 in 1947 through the construction of 4 district hospitals during the year 1938. Three out of these 4 district hospitals are on the approved list of the American Medical Association and the American College of Surgeons.

The number of beds in municipal hospitals increased from a total of 2,017 reported during the year 1935 to 2,145 recorded during the 1947 survey, or 128 beds in a period of 12 years. The expenditures reported for medical care in all municipalities increased from \$1,023,564 during the year 1935 to \$2,780,643 during the year 1947, or an increase of 171.6 per cent. First-class municipalities expended \$488,335 during the year 1935 as compared with \$1,179,468 during the year 1947; second-class municipalities increased their expenditures from \$349,371 to \$932,676 during the same period, and third-class municipalities from \$185,858 to \$668,499. Data collected by the Insular Health Department during the 1947 survey of hospital facilities, as well as a personal inspection of a large number of municipal hospitals visited during the years 1935 and 1947, seem to warrant the statement that with the exception of the municipal hospital in the city of San Juan, and perhaps 1 or 2 other municipalities, there has been no improvement in the quality of medical services provided by municipal hospitals at present as compared with conditions revealed by the 1935 survey. Only 6 municipal hospitals had x-ray equipment in 1947 as compared with 5 during the year 1935, and 5 had laboratory facilities during 1947 as compared with 7 which reported such facilities during the 1935 survey. Twenty-nine out of 55 municipal hospitals registered during the year 1947 had no graduate nurse. One first-class municipality which operated a hospital for 175 beds reported no graduate nurse working on the staff although this hospital employed

10 physicians and 56 nurses aides.

Professional and other civic groups on the Island agree that medical care furnished by the municipalities is far below the standards of modern medical practice. Since the Insular Government, through its Department of Health, already operates a medical care program, including the maintenance of institutions for the care of mental and tuberculous patients, as well as 4 general hospitals, it is highly desirable that the Insular Health Department be made responsible for the operation of the medical care program for the entire Island. In the event this could not be worked out, then the Department of Health should participate financially in the support of such medical care programs in all municipalities willing to adopt standards of care promulgated by the Commissioner of Health with the advice of the Insular Hospital Council.

Public Law 725 of the 79th Congress provides federal assistance to states and territories for the construction of health centers, mental, tuberculosis, general, and chronic hospitals, after a survey of needs has been carried out and a state-wide plan formulated, to serve the entire population.

The law authorizes the Surgeon General of the U. S. Public Health Service to promulgate regulations, with the advice of the Federal Hospital Council.

The Hospital Survey and Construction Act authorizes the expenditure of \$3,000,000 to assist states and territories in the survey and planning phase of the program, and \$75,000,000 annually for a period of 5 years to assist states in the provision of physical facilities. No funds are authorized in the law for the maintenance of hospitals. The appropriation Act as passed by Congress this year provides that states' applications for construction funds and approval of their application by the Surgeon General would constitute contractual obligations on the part of the

federal government. Up to \$75,000,000 can be obligated during the fiscal year 1947-1948. Puerto Rico has been allotted \$2,461,875 for the construction of hospitals during the fiscal year ending June 30, 1948. If Congress appropriates every year the sum authorized by Public Law 725, during a period of 5 years Puerto Rico will have available \$12,309,375 of federal funds for the construction of health centers, hospitals, and related facilities. Non-federal funds are to be available for two-thirds of every project that is constructed. There must be reasonable assurance that funds will be available for maintenance after completion of the facility.

In accordance with the provisions of Public Law 725, 79th Congress, and the regulations promulgated by the Surgeon General of the U. S. Public Health Service, the Island of Puerto Rico needs 10,190 beds for mental patients; 11,593 beds for tuberculous patients; 9,174 general hospital beds, and 4,018 beds for chronic illnesses. The survey carried out by the Insular Health Department during the latter part of the year 1947, revealed that there was a total of 1,298 acceptable beds for mental patients on the Island out of which 1,000 were owned by the Insular Government and 298 were private. This leaves a total of 8,892 beds required to supply the need for this type of patients. The survey further showed that there were 2,254 beds for the isolation of tuberculosis patients out of which 1,892 were owned by the Insular Government and 362 were in private hospitals leaving a total of 9,339 to be constructed in order to supply the needs of $2\frac{1}{2}$ beds per annual death taking the average for the 5 year period 1940-1945.

Beds in general hospitals totalled 6,753 out of which 1,287 were operated by the Insular Government, 2,145 by the municipalities, and 3,321 were maintained by private institutions. Of the private hospital beds 2,241 were in pro-

prietary hospitals and 1,080 in non-profit institutions. A total of 908 beds (364 municipal and 544 private) in general hospitals were considered not acceptable for obvious reasons, leaving a total of 5,845 acceptable general hospital beds for the entire Island and a total of 3,329 general hospital beds required for the needs of the Island.

Only 60 beds for chronic illnesses were revealed by the survey with 3,958 required to meet the needs of the Island.

It is very difficult to estimate the approximate cost of a construction program of health centers and hospital facilities such as that needed for Puerto Rico, not only because of the unsettled condition in the construction industry which is unquestionably subject to changes in a long-range program such as that contemplated, but also because construction estimates for the continental United States are not applicable to Puerto Rico for obvious reasons. However, after careful consideration of available data it has been estimated that a total of \$101,443,000 is required for the construction of the overall program in Puerto Rico which includes 25,518 hospital beds. This estimate includes 8,892 beds for mental patients at \$4,000 per bed, 9,339 beds for tuberculous patients at \$4,000 per bed, 3,329 general hospital beds at \$5,000 per bed, and 3,958 beds for chronic patients at \$3,000 per bed. Construction of health centers is not included in this estimate because there are no final figures available as to the number of these centers needed for the Island in accordance with federal standards. However, since the entire population covering 76 municipalities is now served by health services and 58 health units or sub-units in urban communities, and 5 rural medical dispensaries are located in rented buildings, we believe that \$3,000,000 will be required to provide physical facilities, for health services which are now located in rented buildings.

Estimated funds required for the maintenance of additional hospital facilities needed in Puerto Rico, based on present expenditure by the Insular Department of Health for the maintenance and operation of similar institutions totalled \$21,508,500 per annum.

This estimate is based on an annual expenditure of \$1,500 per bed for general hospitals, \$800 for tuberculosis hospitals, \$750 for mental institutions, and \$600 for chronic hospitals.

High government officials are of the opinion that Insular funds required for construction, maintenance and operation of such a comprehensive hospital program, would not be available in the future. It is believed, however, that funds will be available to construct and operate a substantial part of the program. Upon recommendation of the Hon. Jesus T. Piñero, Governor of Puerto Rico, the Insular Legislature on May 7, 1947, approved Act No. 50 (House Bill No. 1374). This law designates the Commissioner of Health, with the advice of an Insular Hospital Board, to carry out an inventory of existing hospital facilities, formulate an Island-wide plan of needs, and supervise the construction program. Act No. 50 appropriates the sum of \$92,000 for survey and planning and \$5,225,000 for the construction of needed hospitals and health centers. Since non-federal funds are to be available for two-thirds of the construction cost of projects, funds already appropriated by the Insular Legislature are slightly over what is needed to match the federal allotment for the fiscal year ending June 30, 1948. It is expected that funds will be appropriated during the present session of the Insular Legislature to match the federal allotment for the fiscal year 1949.

The Federal Hospital Survey and Construction Act requires that each hospital constructed with federal participation must provide a reasonable volume of hospital services to persons unable

to pay, except in cases when such a requirement is not feasible from a financial standpoint. Since it has been estimated that approximately 80 per cent of the Island's population is unable to pay for medical services, presumably the great majority of hospitals to be constructed under the provisions of Public Law 725, 79th Congress, will be sponsored by Insular or municipal governments.

In accordance with the provisions of the Federal Hospital Law, however, private non-profit institutions are eligible for federal participation. Project applications must be submitted through the Commissioner of Health and should be in accordance with the Insular hospital plan. In all cases the facilities to be built must meet minimum federal standards, there must be reasonable assurance that funds will be available for the operation of the facility after the project has been completed and licensure legislation providing minimum standards for the maintenance and operation of hospitals receiving federal aid must be enacted by the Insular Legislature by July, 1948.

Before closing I should like to state that the formulation of a sound Island-wide health and hospital plan is the responsibility of the Commissioner of Health of Puerto Rico with the advice of the Insular Hospital Council. Before the plan is submitted for the approval of the Surgeon General of the U. S. Public Health Service it is required that a public hearing be held. Representatives of the medical and allied professions, as well as members of different professional and civic organizations, will have the opportunity to make suggestions. The Surgeon General will approve the Insular plan if it conforms to the federal act and regulations.

Coördination of Preventive and Curative Services in Maryland

WILLIAM H. F. WARTHEN, M.D., M.P.H., F.A.P.H.A.

Health Officer of Baltimore County, Towson, Md.

THE origins and purposes of the program for supplying medical care to those in the counties of Maryland who would not otherwise receive it have been reviewed and the techniques of administering the fee-for-service plan described.¹ It has been pointed out that the delegation of administrative responsibility for the program was made possible by the pattern of organization of full-time county health departments which have been developed during the last two decades in all of the 23 counties of Maryland.² Some concern, however, has been expressed by those who have recently studied the Maryland plan about the justification of health department administration of medical care unless the official health agency can make all the proved preventive services available to clients of the medical care program.³ In May of 1947, a little more than two years after the law was passed creating a Bureau of Medical Services, Dr. Robert H. Riley, Director of the Maryland State Department of Health, appointed a committee of staff members* to study, discuss, and make recommendations concerning the ways and means for establishing policies to

promote closer coördination between the preventive and the curative services of the department. The committee has found that medical care in Maryland is logically a function of the State Department of Health. It has been determined as well that much has already been accomplished in integrating the preventive and curative services of local health departments, but much more can and should be done in this highly important endeavor.

THE COUNTY ADVISORY COMMITTEE ON MEDICAL CARE

One of the first decisions reached by the Maryland state-wide Council on Medical Care whose establishment was provided for in one of the sections of the Medical Care Law, was the creation in each county of a County Advisory Committee on Medical Care.

The membership of this Advisory Committee as originally suggested was to include 3 physicians nominated by the county medical society; 1 representative of the county or district dental society, and 1 pharmacist chosen by the Maryland Pharmaceutical Association. The Executive Secretary of the County Welfare Board, the Chairman of the Board of County Commissioners or his delegate, and the county health officer were to serve *ex officio*. The health officer was to serve as Chairman. The Council further recommended that additional members named by the health officer should be chosen from minority racial groups, from the Department of

* Committee on the Coördination of Preventive and Curative Services: P. F. Prather, M.D., Deputy State Health Officer of Washington County, W. B. Johnson, M.D., Deputy State Health Officer of Dorchester County, William A. Harris, M.D., Deputy State Health Officer of Charles County, Dean Roberts, M.D., Chief, Bureau of Medical Services, Maryland State Department of Health, W. Ross Cameron, M.D., Chief, Division of Cancer Control, Maryland State Department of Health, William H. F. Warthen, M.D., Deputy State Health Officer of Baltimore County, Chairman.

Education, the local hospitals, and existing special lay health organizations.

The health officers of the several counties at once organized committees on medical care in accordance with recommendations of the Council. It was soon evident from the experience of many counties that the health officer could develop a close working relationship between the practitioners of medicine and the health department by the active operation of such a committee on medical care. The most valuable function of such a committee is to advise the health officer in regard to local situations in the county so that he may plan and carry out more intelligently and effectively a program adjusted to the needs of his particular area.

The effective functioning of an advisory committee on medical care or other similar counseling group depends largely upon the success of the individual health officer in bringing together the key people in the official agencies and in the important professional and lay groups. A well organized advisory committee is important evidence of successful leadership on the part of a health officer.

The frequency of meetings of a committee may vary with the needs and conditions in individual counties, but there never should be less than 4 meetings each year. A regular monthly meeting is often desirable, but where the committee is large, subcommittee meetings may be held at shorter intervals and the meetings of the whole committee less frequently. Some health officers may wish to enlarge the membership of the committees, as was recently recommended by the State Council, and to expand the advisory function of the committee to cover all functions of the health department, preventive or curative.

THE COUNTY HEALTH DEPARTMENT AND THE PRIVATE PHYSICIAN

At the beginning of the medical care

program each health officer presented the proposed plan to his county medical society for its endorsement. It is both wise and proper for the health officer to make periodic reports to the society on the progress of the various phases of the program. The frequency of these reports must, of course, depend upon the judgment of the health officer.

A personal interview between the health officer and every new physician who establishes a practice in the county is a valuable means of promoting a close working relationship between these practitioners and the health department. In this interview, the medical care and preventive program can be fully explained. In some counties the health officer may be able to visit periodically all the private physicians practicing in his county. Where this is possible, the health officer is able to keep the practitioner fully informed regarding his working connection with the services of the health department.

Another valuable aid in securing the fullest coöperation between the health department and the private practitioners of medicine is a regular visit by the public health nurse to the private physicians in her district. The purpose of the visit should be to explain to the physician the ways in which she may be helpful in his work with his own patients. Such visits by the public health nurse are, however, of value only when the health officer has already established a friendly coöperative relationship with the particular physician to be visited.

The Committee on Coördination recognizes the need for a more effective program of public health education and of better public relations, particularly with the professional groups primarily concerned. A striking example of poor practice in such matters is the large number of mimeographed sheets now sent in unsealed envelopes to physicians. This practice should be changed at once

if public health information is to be gotten to the private physician in such a way as to produce effective action.

PATIENT MASTER INDEX FILE OF PREVENTIVE AND CURATIVE SERVICES

At the present time each county health department maintains a separate file of records for each specialized program. A single patient or family may have records in as many as four or five of these files, but the files are seldom crossed-indexed or coördinated. For example, when a patient comes to a maternity hygiene clinic there is no simple way of determining whether or not this patient has also received service from any other department program, such as tuberculosis or medical care. In order to provide a simple means for assembling all the pertinent data concerning a particular patient, a master index file should be maintained in each health department. This file would contain a separate card for each individual served by any program, preventive or curative, of the health department.

The card should include the name, color, sex, date of birth, and, to prevent confusion of patients with the same name, the name of the head of the family. There would be entered on each card the type of any clinical record already on file in the health department and the place in which it is to be found. The type and location of records may be indicated by abbreviations or coded numbers if that seems desirable. Inactive records should be easily recognizable. It is most important that the individual cards be filed in alphabetical order by surname and be readily available, completely summarized, and easy to use.

The maintenance of a master index file in each county health department should be made the duty of one individual who is charged with the responsibility for making all entries and keeping the file current and in satisfactory

order. Provision must be made for all new information regarding active or closed cases to be reported at once by field and clinic workers to the person in charge of the file.

PERIODIC REVIEW OF MEDICAL CARE CASE SUMMARY RECORDS

The Medical Care Case Summary Record used in local health departments in Maryland contains information which, if carefully reviewed by the health officer, gives valuable aid in determining the amount, kind, and quality of care that is being given. A periodic review of these records is perhaps the best means of becoming familiar with the overall operation of the program in a county and with the individuals receiving care as well. These summary sheets are made up from the *Medical Reports of Services Rendered* and *Dental Reports of Services Rendered*, which are the monthly statements of the services rendered by individual physicians or dentists. These service records have been designed to give the maximum possible amount of useful information without being unduly burdensome to physicians and dentists rendering care under the program.

The medical care clerk should in the course of her daily work, set aside for review by the health officer or his representative, groups of summary records on the basis of the following criteria: (1) cases costing more than \$50 in a period of 6 months, excepting obstetrics and surgery, or cases costing more than \$25 in a period of one month, with the same exceptions; (2) all cases showing use by a client of two or more physicians in any one month, unless one of the two is a consultant; (3) all cases having multiple diagnoses; (4) all cases needing special attention such as reportable diseases, cancer, heart disease, or diabetes.

The health officer may set aside a regular time for reviewing the informa-

tion on the summary records which have been chosen by the medical care clerk on the basis of the criteria cited above. In this review, evidence of inadequacy of medical care or of abuse of the program by vendees or vendors may be noted, any apparent discrepancy between the diagnosis as recorded by the physician and the amount and character of service reported as given may be recognized, and the health officer may be able to judge if the preventive measures offered by the health department have been fully utilized, or if the case is in need of hospitalization.

The county advisory committee on medical care can and should play an active part in assisting the health officer in reviewing any of the summary records that present special difficulties or that cannot be handled in a routine manner. The committee can be of invaluable assistance to the health officer in difficult and puzzling cases, particularly when the health officer feels need of the advice of medical men better acquainted than himself with current clinical procedures.

When found necessary, or advisable, the health officer should confer personally with the physician treating a patient whose records present any unusual features and should discuss with him the findings about which question has arisen. Any action of a health officer in disposing of difficult or controversial cases should take into account the available diagnostic, clinical, and rehabilitation services available in the community. Each health officer should work out a method of his own for the disposition of especially difficult cases. He may, for example, after consultation with his county advisory committee, decide to form a subcommittee consisting of physician members who would sit with him individually or collectively when he confers in his own office with a particular physician who appears, from the data on the case summary

record of cases treated by him, to be incompletely informed or to have misinterpreted the provisions of the program or who seems to be abusing the service.

The health officer should always keep in mind that these situations are the most liable of all his relations with physicians to give rise to misunderstanding and resentment. Each case should be handled with extreme care and with the utmost tact and consideration. To suggest even indirectly that the physician is neglecting the patient on the one hand, or making unnecessary visits on the other, will almost always arouse antagonism and may permanently destroy the possibility of maintaining good relations between the physician and the health department.

CONSULTATION SERVICES

The medical care program should not establish consultation services which in any way duplicate those already in operation. Every effort should be made, however, to encourage full utilization of existing clinics by patients who are eligible under the medical care program, as well as by patients who are eligible under other health programs. Physicians should be encouraged to refer such patients as are in need of consultation services to the orthopedic, cardiac, and hearing clinics sponsored by the crippled children's program. The services of the chest clinics are also fully available to clients of the medical care program. The medical care program discovers many patients with complicated gynecological problems who are greatly in need of consultation services; and consultation clinics in gynecology will soon be developed by the Bureau of Child Hygiene.

The Bureau of Medical Services should endeavor to supplement existing consultation services by the establishment, as soon as is practicable, of consultation clinics in such fields as ophthal-

mology, internal medicine, surgery, and in any other fields in which such service is needed and not now available. The medical staffs of these consultation clinics should possess the highest possible professional qualifications. They should preferably be licentiates of the appropriate specialty board or have equivalent training and experience. Wherever practicable, use should be made of members of the faculties of the medical schools of the state.

PUBLIC HEALTH NURSING VISITS TO MEDICAL CARE PATIENTS

The health department should make every effort to have a public health nurse visit each case or family as soon as possible after admission to any of its services. The visit should be designed both to determine the health needs of the patient and his family and to give any necessary nursing care. The nurse should always attempt to teach someone in the home to render as much of the necessary nursing care as possible so that too frequent nursing visits will not be required.

Before inaugurating such a nursing system, the health officer should discuss with his advisory committee the method of arranging with the attending physicians for nursing visits. In most cases it would seem advisable for the health officer to present the matter to every eligible physician at the beginning of the program, either individually or at a meeting of the county medical society. This should do much to avoid misunderstanding on the part of physicians and prevent the development of any feeling that the nurses are in any manner checking up on attending physicians.

All cases enrolled in the medical care program should, as far as practicable, be visited periodically by the public health nurse. Such visits will frequently bring to the attention of the nurse other persons in the family who need either preventive or curative service which might

be provided by the health department. All cases should be visited which have not been seen by the nurse within the period specified in the nursing policy of the department. This period will vary according to the need of individual cases and will of course be dependent upon the nursing personnel available. The actual planning of the frequency of visits will, therefore, be based on the judgment of the health officer. In all visits of this nature and in all plans for the care of patients and families visited, the public health nurse should be guided by the *Nursing Manual of the Maryland State Department of Health*.

PHYSICAL EXAMINATIONS

It is evident to everyone familiar with the medical problems in the social and economic classes from which come most of the patients receiving medical care under the state program, that there exists in this group a great reservoir of unrecognized, and therefore untreated, disease and defect. Ideally, it would perhaps be advisable to provide a system whereby all recipients of the service would receive a complete physical examination at the time of their enrollment and at stated periods thereafter.

The economic and technical difficulties in the way of establishing such a system are at present so great, however, that it is obviously impracticable to attempt to put it into effect at this time. It is, therefore, all the more important that the facilities for diagnosis now available should be used to the fullest possible extent.

Two of the most valuable aids to diagnosis, an x-ray of the chest and a chemical and microscopic examination of the urine, can now be provided without difficulty through the existing facilities of local departments of health. It would, therefore, seem the part of wisdom to explore the possibility of furnishing these two diagnostic services to every

new case enrolled for medical care. The results of this exploratory procedure may well point the road to a practicable plan for more comprehensive examinations in the future.

CHILD HYGIENE SERVICES

Present prenatal clinics and obstetrical consultation clinics should be enlarged and expanded and new clinics organized in areas where there is need for increased service to medical care patients, and the present policy of calling the attention of private physicians to the availability of these services should be continued. Child health conferences should similarly be enlarged and new services inaugurated in areas as need arises. This need can frequently be determined on the basis of the distribution within the county of medical care patients less than 6 years of age. Here again, as in maternity hygiene, it is important to interest private physicians in utilizing these child health conferences.

School health service in Maryland is rendered as a joint activity of the departments of education and health and the coördination of preventive and curative medical services for this age group is an extremely complicated matter. It is to be hoped that the joint State School Health Council will be of assistance in this matter, and it is recommended that in each county there be formed a county school health council with the health officer and the superintendent of schools serving as co-chairmen. In this local group the Parent-Teacher Association, the medical society, and the dental society should also be represented. These councils should have regular monthly meetings if they are to succeed in securing the necessary improvement in the coördination of school health with other health department services.

DENTAL SERVICES

The complexities involved in rendering either preventive or curative dental

services by public agencies make it a major problem in public health. Among the difficulties are: (1) the almost universal prevalence of dental caries, the results of previous failure to treat dental caries and the recurrent character of dental diseases; (2) the inadequacies of present facilities for dental services; and (3) the great lack of appreciation on the part of the public of the importance of oral health, of the value of preventive dental practices, and of "preventive-curative" care for the young age group.

Preventive-curative services include those operative procedures carried out, usually in younger children, as a means of preventing incipient and small defects from becoming gross. This activity is the one that promises the best results so far as future dental health is concerned. It is essential to the success of such a service that it be concentrated on the full meeting of all the dental needs of as many individuals as possible rather than the partial meeting of the needs of larger groups. The eventual evaluation of a dental health program may well be based on a high ratio of the number of teeth conserved by filling as against the number extracted.

Restorative dental service includes those procedures necessitated by previous failure to employ the foregoing "preventive" practices, and in older age groups is based principally on the necessity for: (a) masticatory functions; (b) appearance, as influencing employability; and (c) health as it is influenced by lack of functions and by appearance.

There is obvious need for a closer correlation between health departments and the dental profession if we are to make full use of the profession as part of our general public health activity. A clearer understanding of health department activities by members of the dental profession would well serve both groups, and in the hands of the general

practitioner of dentistry lies the ultimate solution to the problem of dental health.

LABORATORY SERVICES

It is recognized that any program which seeks to correlate preventive and curative services in county health departments will of necessity require an increasingly large volume of service by the public health laboratory for patients of the medical care program. The need for laboratory service is obvious if patients enrolled under the medical care program are to receive adequate service.

Current information concerning laboratory services should be available to all participating in the program. Physicians and department staff members should be advised at once as to extensions or other changes in the service, and efforts should be made to induce them to make full and discriminative use of it.

REHABILITATION SERVICES

The curative services provided by the health department can be substantially strengthened by coördination with the vocational rehabilitation program of the State Department of Education. This rehabilitation program offers a very complete range of services to persons who have a physical disability which constitutes a vocational handicap. For such persons the rehabilitation program provides the following services:

1. General medical examination by the family physician
2. Consultation and diagnostic services when necessary
3. Physical restoration which may include surgery
4. Certain types of medical, dental, and psychiatric treatment
5. Prosthetic appliances including artificial limbs
6. Hearing aids
7. Vocational training, counseling, guidance, and job placement

The services indicated above are available only to persons who offer a reason-

able prospect of placement in remunerative employment. In the review of its cases the health department should keep constantly in mind the possibility of referral of suitable cases to the rehabilitation program.

In order to make full use of the service, the county health departments should receive current literature regarding the rehabilitation services available. It may invite representatives of the rehabilitation service to discuss their program with the staff of the county health department, and may also request the local representative of the vocational program to review periodically with the health officer the records of those cases suitable for rehabilitation.

CONCLUSIONS

Three years after its inauguration in Maryland the medical care program shows satisfactory progress toward absorption into the regular routine of the county health departments. Much still needs to be done to bring the existing preventive services into more perfect alignment with curative services as exemplified by the medical care program. The committee has carefully explored all the factors which in its judgment may so far have had a bearing upon the success of this absorption. It has considered as well those factors which may in the future influence the smooth and speedy establishment of a closer working relationship between the preventive and curative services in the interests of a broadened and more efficient public health service to the people of the state by the several county health departments. The general conclusion has been reached that medical care, as it has been established and applied in Maryland, is properly a function of the state health department and its component local health units. This opinion is concurred in by the deputy health officers who have participated in the discussions of the committee and by those vitally

and immediately concerned in the central office who have been consulted or have supplied material to the committee.

The major assignment of the committee has been the task of bringing into existence a list of ways and means for improving immediately and at long range, whenever possible, the preventive and curative services of the county health departments and for effecting as rapidly as is reasonable a complete integration of these two services. The assignment has been accepted and the task assumed by the committee, and the results of its work are shown in summary form in a series of recommendations. It is with guarded hope for the soundness and lasting practicability of these recommendations that the committee submits them.

RECOMMENDATIONS

1. The county advisory committee on medical care is, when wisely directed by the health officer, a useful instrument in enhancing close working relationships between the health department, the private physician, and other key individuals in official and nonofficial agencies. Such a committee should meet regularly. Serious and immediate consideration should be given to enlarging the membership to include those individuals familiar with school health and general community activities.

2. Periodic reports of the progress of various phases of the complete health department program should be made by the health officer to the county medical society. The frequency and character of these reports must rest entirely with the judgment of the health officer.

3. The health officer should include in his duties a personal interview and conference with each new physician who establishes a practice in the county. This conference should include a thorough review of all health department activities.

4. An effort should be made by the health officer to establish a regular procedure for visits by the public health nurse to the private physicians in her district. This is possible only when the health officer has been able to achieve a friendly, coöperative relationship with the physicians to be visited.

5. There is evident need in the county health departments for a more effective program of public health education and of pub-

lic relations, particularly those directed toward professional groups. The committee recommends that a special committee be appointed to study this problem.

6. Each county health department should establish as soon as practicable a master index file, alphabetically arranged, of individuals receiving services, both preventive and curative, from the health department. This file should be maintained in readily usable and current condition and should form the basis for planning for all services of the health department.

7. The Committee on Coördination of Preventive and Curative Services is strongly of the opinion that it is a highly important and almost necessary procedure in each health department to institute and systematize a review of the data currently entered on the case summary records in order to maintain a satisfactory current knowledge of the way in which the medical care program is being carried out in the county. Review of the information on these records should be a critical one carried out routinely by the health officer or his representative.

The county advisory committee on medical care should play an active part in assisting the health officer in reviewing those records which present special difficulties and cannot be handled in a routine manner.

The attending physician should be asked to make a special review and report on cases which the health officer has found to be receiving continuous care over an unusually long period. The special precautions necessary in this procedure are suggested.

8. Effort should be made to supplement existing consultation services by the establishment of new consultation clinics in such fields as ophthalmology, internal medicine, and surgery, and in any other field in which such services are needed and cannot be made available through existing services.

Physicians staffing consultation clinics should carry the highest possible professional qualifications and be licentiates of the appropriate specialty board or have equivalent training and experience. If possible, they should be members of the faculty of an approved medical school. These consultation services might well be developed under the guidance of a committee representing the University of Maryland School of Medicine and The Johns Hopkins School of Medicine.

9. A continuing effort should be made by county health departments to develop the ideal of having the public health nurse visit each case or family as early as possible after admission to health department services in

order to determine the health needs of the patient and family and to give the necessary nursing care. Before inaugurating this service the health officer should discuss with his advisory committee on medical care the method of clearance of such visits with the patient's physician.

The public health nurse should be guided by the *Nursing Manual of the Maryland State Department of Health* in making visits and planning the care of the patient and family.

10. Consideration should be given to the need for providing routine physical examinations for recipients of medical care, but before attempting to develop any such program, it is believed by the committee to be essential that a careful "pilot" study be conducted in a selected area.

11. Present prenatal clinics and obstetrical consultation clinics should be enlarged, expanded, and organized in new geographical areas as indicated by the demand, to furnish increased care to medical care patients and also to suitable individuals not included in the medical care program.

Wherever possible, application for maternity care in the medical care program should result in an immediate home visit by a public health nurse to determine the need of the patient for existing services and to explain to the patient the availability of these services.

Child health conferences should be enlarged and new ones inaugurated in geographical areas where the need is demonstrated. The standards of need for these conferences should be restudied in terms of distribution within the county of medical care patients less than 6 years of age.

Wherever possible, application for pediatric care should be made the occasion for an immediate visit by a public health nurse. The purpose of the visit should be to determine the need of the patient for existing health department pediatric services, to explain to the patient the availability of these services,

and wherever possible to arrange for enrollment of the infant or child in a child health conference if only for immunization purposes.

Each county health department should adopt the policy of calling to the attention of private physicians and of educators and parents the availability of certain public services for school aged children.

12. Vigorous efforts should be made by the health officer to bring about as soon as possible a closer coördination of the program of the health department with the individual practitioners of dentistry. Specific recommendations as to ways of improving distribution of dental health information to private dentists may be forthcoming, when and if a committee is formed to study public health education and public relations among professional groups as suggested in Recommendation 5 above.

13. It is recommended that laboratory services be enlarged as necessary to meet the growing demands to be placed upon it by patients actually treated clinically in the medical care program.

Steps should be taken to keep the private physicians of the county currently informed concerning the exact nature of the laboratory services which are available.

14. The curative services provided by the health department can be substantially strengthened by coördination with the vocational rehabilitation program of the State Department of Education.

Comparison of the Immunogenic and Anaphylactogenic Properties of Rocky Mountain Spotted Fever Vaccines Prepared from Infected Yolk Sacs and from Infected Tick Tissue*

DAVID LACKMAN, PH.D., F.A.P.H.A., AND R. R. PARKER, PH.D.

Senior Assistant Scientist, Rocky Mountain Laboratory; and Director, Rocky Mountain Laboratory, U. S. Public Health Service, Hamilton, Mont.

THE purpose of this study was to determine whether the protein present in the routine yolk-sac and tick-tissue (*Dermacentor andersoni*) vaccines against Rocky Mountain spotted fever as prepared for distribution by the Rocky Mountain Laboratory differed in immunizing value and in ability to produce anaphylaxis in the guinea pig.

METHODS

The lots of vaccine used were standardized by determining nitrogen content and complement-fixing activity against convalescent, Rocky Mountain spotted fever guinea pig sera. For each test both the yolk-sac vaccine and the tick-tissue vaccine were adjusted to the same nitrogen content. Dosages used were from 0.004 mg. to 0.160 mg. total nitrogen. Quantities below those giving complete immunity were purposely chosen so that any differences existing between the vaccines could be detected.

Male guinea pigs were used for the potency tests. Each was injected subcutaneously with the immunizing dose of

vaccine 10 days prior to receiving, intraperitoneally, a challenge dose of blood taken from a guinea pig infected with Rocky Mountain spotted fever. Temperatures were taken daily for 12 to 16 days following challenge. The criteria for immunity were the absence of scrotal swelling and reddening and of a rise in temperature above 39.6° C. At the end of this period they were tested for sensitivity by injecting 1 ml. of the original vaccine intracardially.

TEST DATA AND DISCUSSION

Four tests were made. In each test, a lot of yolk-sac vaccine was compared with a lot of tick-tissue vaccine; equal numbers of guinea pigs receiving each vaccine. The analysis of the vaccine lots used is given in Table 1.

It will be noted that the yolk-sac vaccines contain about three to four times as much total nitrogen as the tick-tissue vaccines. Therefore, the yolk-sac vaccines were diluted three to four times more than the tick-tissue vaccines to bring both preparations to the same nitrogen content.

The results of vaccination are given in Table 2.

* Presented before the Medical Bacteriology Section of the Society of American Bacteriologists at the 48th General Meeting in Minneapolis, Minn., May 12, 1948.

TABLE 1

Data on Vaccine Lots Used

| Yolk-sac Vaccine | | | | Tick-tissue Vaccine | | | |
|------------------|--------------------|-------------------------|------------------------------------|---------------------|--------------------|-------------------------|------------------------------------|
| Lot Number | Total N mg./ml. | Complement- free mg. | Complement- containing mg. N | Lot Number | Total N mg./ml. | Complement- free mg. | Complement- containing mg. N |
| S-102 * | 0.250 | 1:16 | 255 | 3-9 * | 0.35 | 1:4 | 2:1 |
| S-114 * | 0.339 | 1:2 | 20 | 3-13 * | 0.112 | 1:16 | 1:4 |
| S-104 * | 0.435 | undiluted | 11 | 3-17 * | 0.112 | 1:16 | 2:1 |
| S-139 * | 0.421 | 1:2 | 24 | A-2 | 1.435 | 1:128 | 4:4 |

* These vaccines passed the preliminary potency tests set up by the U. S. Bureau of Animal Industry.

TABLE 2

Results of Vaccination

| | Yolk-sac vaccine | Tick-tissue vaccine |
|--|---------------------|------------------------|
| Number vaccinated | 65 | 51 |
| Number developing intercurrent infection | 17 | 12 |
| Number developing Rocky Mountain spotted fever after challenge | 31 | 21 |
| Number showing immunity | 20 | 33 |
| Percentage showing immunity | 39% | 65% |

In each test, 6 normal guinea pigs were injected with the challenge material; all 24 of these animals developed typical Rocky Mountain spotted fever. From the table it can be seen that, of the 51 guinea pigs injected with yolk-sac vaccine and challenged, 20, or 39 per cent, were protected; in the group of 56 vaccinated with equivalent doses of tick-tissue vaccine, 33, or 63 per cent, proved to be immune.

In interpreting these results it should be borne in mind that the yolk-sac vaccines as distributed contain three to four times more nitrogen than the tick-tissue vaccines, whereas, in our experiments, dilutions containing equal amounts of nitrogen were used. In actual practice, if the recommended dosages were used, a patient would receive three to four times the amount of nitrogen with the yolk-sac vaccine as with the tick-tissue vaccine. From the practical standpoint these results indicate that both preparations are about equally active in inducing immunity in guinea pigs to Rocky Mountain spotted fever.

The results of the tests for anaphylactic sensitization are given in Table 3.

From the table it can be observed that 58.5 per cent of the guinea pigs injected with yolk-sac vaccine showed anaphylaxis, whereas none of the guinea pigs injected with an equal amount of tick-tissue vaccine and tested with tick-tissue vaccine showed sensitivity. Guinea pigs recently recovered from spotted fever, and some normal ones, were also injected intracardially with the materials used in challenging for sensitivity as controls upon its primary toxicity; no reactions were noted. Therefore, the reactions obtained in the guinea pigs vaccinated with yolk-sac vaccine probably are due to true anaphylactic sensitization. In evaluating these results it should be pointed out that there is no well established connection between anaphylactogenic properties of an antigen in guinea pigs and the production of sudden deaths in human beings (such reactions often occur on the first injection) by the administration of a foreign protein. Thus, the safety of a product for administration to human beings would depend on

TABLE 3

Results of Tests for Anaphylactic Sensitization

| | Yolk-sac vaccine | Tick-tissue vaccine |
|---|---------------------|------------------------|
| Number of vaccinated guinea pigs tested with homologous material | 41 | 31 |
| Number showing severe to fatal anaphylaxis | 24 (58.5%) | 0 |
| Number vaccinated with tick-tissue vaccine and challenged with yolk-sac vaccine | | 13 |
| Number of these animals showing sensitivity | | 0 |

the number of persons naturally sensitive to the protein in question rather than on its ability to produce anaphylaxis in the guinea pig.

CONCLUSIONS

Rocky Mountain spotted fever vaccines prepared from infected yolk sacs

and from tick tissue were about equally active in producing immunity in guinea pigs. The protein present in the tick-tissue vaccines failed to produce anaphylaxis in guinea pigs, whereas that present in yolk-sac vaccines produced anaphylaxis in 58 per cent of the guinea pigs tested.

Laboratory Procedure for Evaluating Practical Performance of Quaternary Ammonium and Other Germicides Proposed for Sanitizing Food Utensils

GEORGE R. WEBER, PH.D., AND LUTHER A. BLACK,
PH.D., F.A.P.H.A.

S. A. Scientist; and Principal Bacteriologist, Milk and Food Sanitation Laboratory, Water and Sanitation Investigations, U. S. Public Health Service, Cincinnati, Ohio

THE evaluation of the germicidal efficiency of quaternary ammonium compounds has caused much controversy.¹ It has been recognized by most investigators that no single procedure for testing germicides supplies the complete information necessary for the use of any one compound under all types of applications. Furthermore, a testing procedure suitable for one type of germicide may not be applicable in all details to the testing of another germicide. DuBois² reported that "little effort has been made to develop a laboratory technique for the evaluation of sanitizing agents, without the need of a practical trial." It was hoped, "that such a technique can be satisfactorily evolved through a suitable combination of the methods described."

Following practical experience in the use of quaternary ammonium germicides for sanitizing food utensils, an effort was made to find a laboratory method suitable for the evaluation of such compounds. A number of proposed methods or variations of proposed methods were reviewed. Portions of techniques which appeared to be most suitable were selected from this series of procedures, and in some cases modified in order to formulate a labora-

tory procedure simulating actual practical performance of germicides when used for food utensil sanitizing.

REVIEW OF METHODS

The principal methods suggested for evaluating germicides³ are generally of two types. One involves a comparison of the germicidal value of the test substance with a standard disinfectant (e.g., phenol coefficient), the other involves the actual determination of rate of death under standard conditions (e.g., survivor curve, in which times required to kill definite percentages of test organisms are compared).

Phenol-coefficient methods

The phenol-coefficient⁴⁻⁶ type of procedure has been in use for many years in germicide evaluation for regulatory purposes and to prevent gross fraud. Much opposition has been expressed relative to the use of the phenol-coefficient procedure for evaluation of quaternary ammonium compounds. The reporting of "skips" and "wild pluses"¹ is quite common. Several modifications of the phenol-coefficient test have been proposed in an effort to compensate for what have been stated to be shortcomings of the procedure

when applied to quaternary ammonium compounds and other non-phenolic types of germicides.

In the phenol-coefficient method, the exposure period is longer than is recommended⁷ or is practical for food utensil sanitation. The concentration of germicide employed bears no apparent relationship to that which would be required for sanitizing food utensils. The phenol coefficient is an abstract number and no means appears available for interpreting the phenol coefficient in terms of exposure times and germicide concentrations necessary for food utensil sanitation. The suggestion has been made⁸ that twenty times the phenol-coefficient concentration would be satisfactory as a "use" concentration for certain types of applications.

Because of the surface activity of quaternaries, some investigators¹ indicate that the standard loop used for transfer would not carry a standard amount of testing suspension. Pipettes (Kahn)⁹ have been substituted in an effort to overcome this difficulty. Since a positive transfer tube of broth may result presumably from one (or a few) living organisms, as well as from numerous surviving bacteria, quantitative estimations by plating have been proposed¹⁰ in order to ascertain the extent of killing in those instances where complete killing is not obtained.

If one or a few bacteria are splashed on the walls of the medication tube and later mixed into the germicide, these organisms are not exposed to the germicide for the full period. In order to reduce the possibility of splashing, Pressman and Rhodes¹¹ devised a modified procedure in which the test organisms are carefully placed in the medication tube before the beginning of the test. Following this, the germicide was added without mixing. Other investigators have employed this principle in testing.¹²

Some doubt has been expressed as to whether negative transfer tubes actually

represented 100 per cent kill in the medication tube. Klarmann and Wright¹ devised a "semi-micro" modification of the phenol coefficient, in which only one-tenth the usual volume of germicide-culture mixture was employed in order that the entire mixture might be cultured. Cade¹³ has swabbed the inside of medication tubes and subsequently "swished" the swab in a tube of melted agar, with or without plating, to ascertain if test organisms were surviving.

In order to compensate for the fact that the concentration of germicide employed in the phenol coefficient bears no direct relationship to the concentration to be employed under practical food utensil sanitizing, Mallmann, *et al.*¹⁴ have proposed a modification in which the actual "use dilution" of germicide is employed in the testing procedure.

Some investigators have felt that a test organism dried on a glass surface more nearly approached practical conditions than one suspended in the germicidal solution. In this connection, Johns¹⁵ has proposed the use of glass slides, previously dipped in a culture of test organism and allowed to dry. Mallmann, *et al.*¹⁴ have employed glass rods or rings previously "seeded" with the test organism and then dried. In a study of the efficiency of machine dishwashing, Mallmann, *et al.*¹⁶ have included a test organism in a utensil soil. Following the dishwashing, the utensils were swabbed in order to ascertain the number of surviving bacteria on the utensil surface.

In the phenol coefficient the number of test organisms per ml. of test solution is rather well established in that a constant amount of a standard broth culture is added. However, different test organisms are employed (generally *Eberthella typhosa* or *Staphylococcus aureus*).⁸

Survivor-curve methods

While basically several types of ger-

micide testing procedures are related in some manner to the phenol coefficient, one which has been recognized for a good many years is the survivor-curve type.¹⁷ In 1897 Ikeda¹⁸ was able to show that when the logarithms of the numbers of surviving bacteria were plotted against the elapsed time, a straight line was obtained. The rate of disinfection was found to be logarithmic and generally in agreement with the rate calculated for a monomolecular reaction. Buchanan and Fulmer³ (1930) reported that pseudomonomolecular reactions are of far more concern in biology than are the true monomolecular reactions. Sigmoid-type curves are frequently observed. Numerous workers have used the survivor curve for ascertaining the efficiency of germicides, and this type of procedure does simulate more nearly actual practical application of germicides, in many instances, than does the phenol coefficient. The survivor-curve procedure has been used for evaluation of such germicides as chlorine^{19, 20} and chloramines. It was this type of testing procedure that made possible several fundamental studies relative to coefficients of temperature, concentration, and pH. Recently this type of procedure has been used for ascertaining germicidal efficiencies of quaternary ammonium compounds.^{21-23, 12}

DuBois and Dibblee²³ observed in death rate studies on a high molecular quaternary ammonium compound, employing *Bacillus metiens* spores, that there was an almost immediate reduction in plate count of 60 to 75 per cent. However, even after 6 hours, only about 90 per cent of the spores were killed. McCulloch²⁴ has reported that quaternary ammonium compounds have a tendency to "agglomerate" test organisms, thus reducing the plate colony count without necessarily reducing the viable cells. From this, it is indicated that when the logarithms of the surviving bacteria are plotted against time of exposure, the

slope of the resulting curve does not necessarily provide a true index to the rate of disinfection as it apparently does for some germicides, since this curve tends to become asymptotic, paralleling the exposure-time axis. Apparently for this reason some investigators^{22, 24} have preferred to select exposure times required for 100 per cent kill for comparative purposes, rather than a lesser percentage such as 99, 99.9 etc.

Other details of methods reviewed

Since quaternary ammonium compounds are relatively new germicides, until recently we have not had available satisfactory inhibitors for inactivating the germicides, similar in action to that of sodium thiosulfate with chlorine. Even at the present time, there is some question as to the limiting ratio of inhibitor³² to quaternary effective in protecting different types of test organisms from both bactericidal and bacteriostatic action. However, some of the recently proposed methods^{25, 26, 6, 21, 12} for evaluating the germicidal efficiency of quaternaries include the use of inhibitors.

In reviewing procedures for testing quaternaries, it was noted that the volume of testing solution in the various tests, ranges from 0.55 ml. to 500 ml. Presumably the larger volume is employed in some instances in order to increase the ratio of volume to glass surface to reduce the possible effect of glass surface upon the cationic germicides. Other advantages of a larger volume appear to be to furnish sufficient material for side tests and to stabilize temperatures, particularly where high or low temperatures are to be maintained.

Generally, proposed procedures have employed either a standard nutrient broth or a standard agar medium for culturing, except in those instances where quaternary inhibitors were added to the medium. Cultures, when grown on an agar medium, were generally suspended

in a buffered medium or water. A variety of test bacteria, both Gram-negative and Gram-positive, spore-formers and non-spore-formers, has been employed for evaluating quaternaries. The number of test organisms per ml. of test solution employed by various investigators varied somewhat. In one procedure it was as low as about 1,000, whereas in another it was as high as 900×10^6 .

Exposure intervals varied from 1 second¹³ to 30 minutes.¹⁴ In certain instances^{12, 22} attempts have been made to have an exposure period which would normally take place in food utensil sanitizing.

Other details such as type of container, cover of container, addition or absence of organic matter, etc., varied considerably.

PRELIMINARY INVESTIGATIONS

1. Selection of survivor-curve method

After reviewing the available methods for evaluating quaternary ammonium compounds (and other germicides) proposed for food utensils sanitizing, it appeared that none quite completely met all the necessary requirements. We have endeavored therefore to devise a method which is simple and which more nearly simulates practical conditions of application. An attempt was made to employ only equipment which would normally be found in any bacteriology laboratory. The survivor-curve type of procedure was selected because it more nearly represented actual practical conditions of food utensil sanitizing than did the phenol-coefficient type.

2. Number of test organisms

One problem considered was that of the number of test organisms per ml. of germicide solution. To determine this, plate counts were made of artificially contaminated dish water and compared with standard swab-rinse plate counts from food utensils (glasses) dipped in

the dish water and allowed to drain for 15 minutes (rins up). For these studies a pure culture of *Escherichia coli* was employed. It was observed that an average ratio of bacteria per ml. of dish water, to bacteria per utensil (glass) submerged, drained and swabbed, was about 100/1 for both heavily and lightly contaminated dish waters. This would appear to indicate that a feasible number of test organisms per ml. of test solution (corresponding to dish water) would be 100 times the highest counts found normally on food utensils. Records from U. S. Public Health Service mobile laboratories of food utensil plate counts made during the recent war in various areas of the United States indicate that high counts ranged from several hundred thousand to about 1 or 2 million bacteria per food utensil (usually glasses), as indicated by a standard swab-rinse plate count²⁷ procedure. Therefore, it appears that from about 1 million to 100 million test organisms per ml. would be a reasonable range for numbers of test organisms to correspond to actual practical conditions. Since it is known that the greater the number of test organisms, other conditions being equal, the longer the killing time,³ lower counts would have a shorter killing time and would appear to give a false indication of the true effectiveness of the germicide under adverse conditions of heavy loads of contamination. A test solution containing 100 million bacteria per ml. of test solution would appear to correspond to a heavy load of contamination in dishwashing.

3. Volume of germicide-bacteria mixture

The volume of test solution was next determined. It was, of course, desirable from several points of view to have a small volume of solution. This would require less germicide, less water for diluting, fewer actual test microorganisms, and more convenient receptacles in which to carry out the tests. One of

the arguments for a large volume of test solution would be that of maintaining a high ratio of liquid to surface in order to reduce any adsorption of cationics to glass surfaces. Several reports have been made relative to the adsorption of cationics upon surfaces. DuBois²⁸ found from 17 to 31 per cent of certain quaternary ammonium compounds adsorbed to filter paper but it is indicated that lesser amounts were adsorbed to glass surfaces. Eckfeld and James²⁹ reported that in Petri plates, the quaternary was removed from the agar gel, and adsorbed onto the glass. When nutrient agar was spread over glass in an extremely thin layer, growth of *Staphylococcus aureus* was obtained, whereas in the thicker layers it was not. The results were explained as, "due to the adsorption of sufficient of the quaternary from the agar in close proximity to the glass to permit bacterial development."

In order to determine just how great the adsorption of cationics on glass was, a recently developed procedure for titration of quaternaries³⁰ was employed. It was observed by titration that when the amount of surface was increased greatly, by using large amounts of glass wool submerged in quaternary solutions, a considerable amount of quaternary (about 65 per cent) was adsorbed. This adsorption appeared to take place largely in the mesh of the glass wool where agitation could not diffuse it thoroughly. However, when 10 ml. portions of quaternary solutions (200 p.p.m.) were transferred serially through ten test tubes by both pouring and pipetting, from 98 to 100 per cent of the quaternary was recovered by titration.

It would appear that adsorption does take place and is of considerable significance where extreme ratios of surface to volume are maintained and where agitation is not great, e.g., with a mesh of glass wool, in agar media etc. On the other hand, if conditions are such that the ratio of glass surface to volume of

solution is in the range which would be encountered in the ordinary handling of solutions for testing, indications are that with thorough mixing, losses of quaternary by adsorption will be of little significance. It would appear that adsorption of cationics onto glass surfaces would not be of such a magnitude or of such permanence that small samples (10 ml.) thoroughly mixed could not be used in a testing procedure. It is not indicated that this mixing needs to be extreme, but only that which would ordinarily be employed for obtaining a uniform bacterial suspension. In connection with the adsorption of quaternaries to glass²⁹ surfaces from agar, it is of interest to note that Quisno, *et al.*³¹ (1946) reported that agar reduces the germicidal efficiency of quaternary ammonium compounds, and they suggest that this reduction is due to physical adsorption. Agar media have been relied upon to neutralize quaternaries in connection with certain types of testing procedures. However, other inhibitors appear to be more effective.^{32, 35}

In connection with adsorption of cationics by surfaces, we have found that simply by forcing a cotton plug to the bottom of a test tube containing 10 ml. of a quaternary (200 p.p.m.), about 40 per cent was adsorbed immediately and little change was noted, even after standing for 24 hours. The use of cotton plugs, filter paper, and similar substances, in such a manner as to permit contact with quaternaries in a test solution, is not recommended. Glass caps are to be preferred for covering medication tubes.

4. Test organism in suspension versus test organism dried to glass surface

Since some investigators¹⁴⁻¹⁶ have devised procedures in which the test organisms were dried on a glass surface rather than suspended in a solution, limited comparative studies were made using these two principles. Glass micro-

scope slides were dipped in a suspension of a test organism (*Escherichia coli*), drained for 30 minutes at 37° C., and submerged for definite exposure periods in a solution of a quaternary. One hundred per cent kill was obtained in about the same exposure period as when approximately the same concentration of test organisms was employed, suspended in the germicide solution. The method in which the test organisms are dried on the surface of glass slides, has merit in "measuring the ability to kill organisms present on a surface in a film of organic matter."¹⁵ However, it did not appear to lend itself as well as to the use of inhibitors for instantaneous neutralization of the quaternaries as did methods in which the test organisms were suspended freely in the germicide. Since exposure periods required to produce 100 per cent kill were approximately the same for both types of procedures, for simplicity, the one in which the test organism was suspended in the germicide was selected.

5. Selection of test organism

A variety of test organisms has been employed in proposed testing procedures. Generally, it has been observed that Gram-negative non-spore-forming bacteria (e.g., *Escherichia coli*) are more resistant to quaternaries than are Gram-positive microorganisms (e.g., *Staphylococcus aureus*). The use of Gram-negative non-spore-forming test organisms would appear to be a good choice. Reports³ indicate that cultures about 24 hours old show least fluctuation in resistance. Studies reported¹² show that *Escherichia coli* demonstrated resistance to quaternary ammonium compounds approximately equivalent to pathogenic organisms such as *Salmonella schottmülleri*, *Shigella dysenteriae*, and *Eberthella typhosa*, but there was no significant factor of safety. For most of our studies, a strain of *Escherichia coli*²² used in other studies at this Station or

of *Staphylococcus aureus* 209 was employed. A few other test organisms also were used.

6. Choice of end point

Frequently, in comparing germicides by the survivor-curve type of procedure, an end point of something less than 100 per cent kill is used, e.g., 99.9, 99, etc. Because, however, of the reported clumping and "agglomerating"^{23, 24} we have selected 100 per cent kill. Selecting a lesser percentage kill did not appear feasible in view of reports which indicate that the death rate with quaternaries is not constant.

7. Temperature

Generally, temperatures previously employed for testing have been 20° C. We have used 25° C. since it appeared to be nearer to room temperature and might be considered to be about the lowest to which dish rinses would ordinarily drop. Also, 25° C. is generally easier to maintain during testing than is 20° C., especially where special water baths are not available.

8. Exposure times

Exposure times were selected as 15, 30, 60, 120, and 300 seconds. The selection of the shorter exposure periods was based on observations in the field showing the need of sanitizing food utensils within this time under certain practical conditions. Regulations⁷ generally require that utensils sanitized by chemicals be exposed for 120 seconds. The 300 second exposure was designed²² to give additional information on inferior compounds not effective in shorter periods of exposure.

9. Type of water

It has been reported³³ that the water in which a quaternary germicide is tested may greatly affect the germicidal efficiency. For this reason, in a given experiment a constant type of tap water

(or distilled, in a few instances) was employed for suspending the test organism as well as for diluting the germicide. No attempt was made to sterilize tap waters, in order to avoid possible changes. However, distilled waters, when used, were previously sterilized.

GERMICIDE TESTING PROCEDURE

Controls

Sterility control plates were made on all waters. Initial and final counts were made on bacterial suspensions to serve as a control for possible germicidal action of suspending waters as well as to establish the initial number of test organisms employed. All equipment, media, and reagents were sterilized; however, tap waters were used without autoclaving.

Preparation of germicide

Quaternary germicides were diluted in the water (dechlorinated with sodium thiosulfate, generally 0.1 ml. of a 4 per cent solution per 100 ml. of tap water) so that the concentration was double that desired for testing. Usually germicides were tested in the concentration recommended by the manufacturer, or in many instances with quaternaries, at 200 p.p.m. if no recommendations were stipulated. No attempts were made to adjust reaction, but the pH of a duplicate solution was determined.

Preparation of suspension

A standard 99 ml. milk dilution bottle³⁴ previously sterilized, was filled to the 99 ml. mark with the water to be used for the test, sodium thiosulfate²² being added to neutralize residual chlorine. Approximately 5 ml. of this water was then delivered to the surface of a 24 hour 37° C. nutrient agar slant of the test organism (generally *Escherichia coli*). A twisted double-wire nichrome loop, with shaft 12 cm. in length, was used to loosen organisms from the agar slant and the entire con-

tents were rapidly poured back into the 99 ml. dilution bottle.

After mixing³¹ by shaking the bottle rapidly 25 times in a vertical 1 ft. excursion within 7 seconds, 5 ml. was carefully delivered to the bottom of a large test tube (25 x 150 mm.) which had previously been sterilized with a glass cap covering. Care was taken to avoid touching the walls of the test tube; *when the walls were touched, the tube was discarded*. For this purpose, 5 ml. tip-delivery bacteriological pipettes (e.g., blue line Kimble retested No. 37080) were employed. (The aperture of these pipettes was about 2 mm. in diameter).

This suspension contained generally about 200×10^6 organisms per ml., such that when diluted with an equal volume of germicide solution, approximately 100×10^6 organisms would be contained in 1 ml. of germicide-bacteria mixture. In some instances counts were higher, hence only a portion of the suspension from the agar slant was used for transferring into the 99 ml. dilution bottle previously described.

Test procedure

Solutions of germicides as well as bacterial suspensions were held in a 25° C. incubator (or water bath) when not in use, both before and during the test. At the beginning of a test, the medication tube containing the 5 ml. of bacterial suspension was placed in a beaker containing water at 25° C. Likewise about 10 ml. of the germicide (in a test tube) was brought to this temperature, and 5 ml. removed (using a 5 ml. pipette previously described). The pipette was carefully placed in the medication tube and held in a vertical position with the tip just above the surface of the suspension (the glass cap of the tube having been previously removed and placed in the bottom half of a sterile Petri dish until after removal of the 30 second test portion). As the sweep second hand of an interval timer reached

the starting time, the contents of the pipette were released in a manner such that a layer of germicide was formed over the culture. (Best results appeared to be obtained by holding both tube and pipette in the hands in a vertical position. This is important, since if complete mixing is obtained without splashing culture on the walls of the tube, all test organisms will have an equal exposure period to the germicide, and "skips" or other discrepancies will be reduced or eliminated.)

After discarding the pipette, the contents of the tube were immediately mixed by a "swirling" motion and the first test portion of 1 ml. was removed after 15 seconds with a standard 1.1 ml. bacteriological pipette and placed in a test tube (cotton stopper) containing 9 ml. of a lecithin solution and immediately mixed. (Care was taken to deliver rapidly by blowing the portion into the 9 ml. of lecithin inhibitor on the exact second stipulated.) Subsequent samples were removed after 30, 60, 120, and 300 seconds, thoroughly swirling the contents of the tube prior to removal of each test portion. (For most work a 9 ml. blank containing 20 mg. lecithin (asolectin)* in phosphate buffer was used. For dispersion of the lecithin, a ratio of 7 ml. tween 80† to 1 gram of lecithin^{35, 36} was maintained.)

Plates were prepared for each exposure period in both 1 ml. and 0.1 ml. aliquots (from the lecithin blanks) resulting in 10^{-1} and 10^{-2} dilutions,³⁴ and poured with tryptone glucose extract agar containing 100 mg. of lecithin³² (asolectin in tween 80) per 100 ml. of medium. When *Escherichia coli* was employed as a test organism, cultures were incubated for 24 hours at 35–37° C. For certain other test organisms, longer

periods of incubation were required.

Additional controls

Following the withdrawal of the 1 ml. portion at 300 seconds in order to check for surviving bacteria, an excess of lecithin (at least 40 mg. contained in 1 ml. of solution—in other instances, more) was added to the tube containing the germicide-bacteria mixture. A sterile swab (about 22 cm. in length) was inserted and the walls of the "medication" tube swabbed. The swab was removed to a Petri dish, the swab stick cut off just above the cotton (by means of an electrically heated, hot wire)³⁷ (Fisher Hot-Wire Glass Cutter), and the plate containing the swab poured with lecithin-tryptone glucose extract agar. Following this, the "medication" tube was poured with tryptone glucose extract agar (15 ml. containing only 75 per cent the normal water content). For *Escherichia coli*, violet red agar was occasionally substituted for identification, but generally tryptone glucose extract agar gave clear-cut results.

DISCUSSION

Test procedure

Our results indicate good correlation between the plate counts made at 300 seconds, the bacteria surviving in the tube, and the bacteria adhering to the swab. It would appear that tests could be satisfactorily made by eliminating the additional controls after the laboratory worker becomes proficient in use of the testing method, although these controls do help to explain some discrepancies due to splashing of culture on the walls of the testing tube, etc. The swabbing technique may be used after exposure periods shorter than 300 seconds, if desired.

When *Staphylococcus aureus* was employed as a test organism, a ratio of lecithin to quaternary of 100/1 was maintained in the 9 ml. lecithin dilution blanks. This ratio was also maintained

* Asolectin obtained from Associated Concentrates, Inc., P. O. Box 1535, Atlanta, Ga.

† Tween 80 obtained from Atlas Powder Co., Wilmington, Dela.

for *Escherichia coli*, although lower ratios for this organism were sufficient to prevent bacteriostasis. The advantages of using small amounts of lecithin in the agar medium are described elsewhere³²; care must be taken to maintain a pH near neutrality. By adding 5 ml. of a double strength germicide to 5 ml. of a double concentration of bacteria, there results single concentration of both germicide and test organism. Other ratios were considered but this appeared more satisfactory from the standpoint of simplicity and the standpoint of complete instantaneous mixing. Where efficiencies of quaternaries (or other germicides) are to be ascertained at higher temperatures, obviously only the germicide (not the bacteria) should be heated to the higher temperature previous to the beginning of the test; consequently the ratio of the volume of germicide to volume of bacteria suspension would need to be increased.

By the use of 5 ml. bacteriological tip-delivery pipettes with a wide aperture (about 2 mm. in diameter, described previously), it is possible to release the volume of germicide onto the bacteria with such rapidity that mixing is reasonably complete. Time is thus available for "swirling" the tube before the 1 ml. aliquot is removed at 15 seconds. Ten ml. pipettes were found to be more difficult to use for delivering 5 ml. of quaternaries, since with the large air space above the solution in the pipettes and the reduced surface tension, dripping often occurred. Slow-delivery pipettes are not satisfactory.

Comparative studies using test procedure

In order to ascertain whether this test gives a fair estimate of what could be expected under practical application, limited comparisons employing a pure culture of test organisms have been made with plate counts from swabbings²⁷ taken from sanitized utensils. In gen-

eral, if a compound gave poor results by the survivor-curve method herein described, the counts on utensils sanitized in this compound were also high. Likewise, a compound appearing by this testing procedure to be efficient, was able to sterilize (with respect to non-spore-formers) utensils under actual conditions of application.

To evaluate the testing procedure and determine that it was not requiring too much or too little of a germicide, tests were made employing only 50 p.p.m. available chlorine.⁷ An alkaline hypochlorite was selected^{19, 20} since it is known that the germicidal efficiency of hypochlorites decreases with increasing alkalinity, and alkaline hypochlorites are the slowest of the hypochlorites (chloramines including chloramine T generally are even slower).³⁸ Sodium thiosulfate was used as an inhibitor. Under these conditions 100 per cent kills were obtained in about 30 seconds. This is within the limit set by the U. S. Public Health Service Code Regulating Eating and Drinking Establishments.⁷ Years of experience with hypochlorite compounds would substantiate that this compound in the minimum concentration permitted (50 p.p.m.) is effective for utensil sanitizing. Chloramine T solutions of 200 p.p.m. available chlorine (approximately pH 8) gave 100 per cent kills under these conditions in 120 seconds. Hypochlorite tests were made in both distilled water and Cincinnati tap water, and chloramine T tests were made in distilled water. The germicidal efficiency of chlorine compounds as measured by tests made in finished chlorinated tap waters would not appear to be greatly different from results of tests made in distilled water.

In the evaluation of quaternary ammonium compounds by this testing procedure, our results from about 100 tests have been rather clear-cut and definite. The time required for a 100 per cent kill by this testing procedure would ap-

pear to be a fair index to the time required for sanitizing food utensils in the final germicide bath at the given concentration. No margin of safety would appear to exist. No compensation is made for any organic matter present; utensils should be free of organic matter before being exposed to germicides in the final rinse. Some types of organic matter present will reduce effectiveness of the germicide, especially with quaternary ammonium compounds and hypochlorites. Concentrations may be increased in an endeavor to shorten the exposure time required; however, in this connection, caution must be exercised as some discrepancies have been reported.²² It would appear that new compounds proving to be satisfactory by this laboratory procedure should be closely observed under actual conditions of usage by means of the standard swab-rinse plate count procedure for food utensils.²⁷

It has been reported²² from comparative fundamental studies that when quaternaries are tested in waters of different types, germicidal efficiencies vary. We have been able to demonstrate this phenomenon by the procedure described herein and it is especially pronounced with some quaternaries combined with what are stated to be non-ionic detergents. For this reason and because at this time we do not have available a satisfactory chemical testing procedure for actually measuring the effective quaternary residual, it is recommended³³ that quaternary ammonium compounds be tested in the waters (not autoclaved) in which they are to be used under practical conditions. Autoclaving may precipitate substances which normally interfere with quaternaries. Generally, chlorinated finished water supplies should have a bacterial count sufficiently low so as not to interfere with testing.

INTERPRETATION OF RESULTS

Generally we have found that in the recommended concentrations (usually

about 200 p.p.m.) in local tap waters (Cincinnati and Norwood) employing *Escherichia coli*, some quaternary ammonium compounds give a 100 per cent kill in about 60 to 120 seconds, while other compounds are completely ineffective even after 5 minutes, or are only slightly effective, in that the "break" in the survival curve is just beginning at 5 minutes. Some compounds gave 100 per cent kills in 30 to 60 seconds in Cincinnati tap water, but in Norwood tap water the killing times were extended. However, when the recommended concentration of certain compounds was doubled it was possible to obtain in Norwood tap water kills in about 30 seconds. Slight variations in killing time have been observed. (Cincinnati tap water is a surface water; Norwood tap water is from deep wells.)

When *Staphylococcus aureus* and *Micrococcus caseolyticus** were used, killing times were substantially reduced. In distilled water, compounds tested have much shorter killing times than in tap waters, yet plate count controls indicate the distilled water (or tap water) has little or no effect in itself in reducing numbers of viable test organisms during the period of exposure in these experiments. It is possible, therefore, to test quaternary ammonium compounds and other germicides in such a manner that an inferior non-effective product would appear effective and acceptable, simply by choice of a susceptible test organism, by choice of a compatible tap water, distilled water, or buffered distilled water, by reducing the inoculum or by inadequate inhibition (depending upon the test organism).

*Escherichia coli*²² (or other Gram-negative non-sporulating bacteria) would appear to be a good choice as a test organism since its resistance with quaternaries^{12, 39} and other germicides has

* Secured through courtesy of Dr. W. L. Mallmann, Michigan State College, E. Lansing.

at least been reasonably comparable with pathogenic Gram-negative non-sporulating bacteria; it is more resistant to quaternaries than certain Gram-positive bacteria, and bacteriostasis is eliminated³² with less difficulty by use of inhibitors with this organism than with some of the Gram-positive cocci. Also, *Escherichia coli* is reasonably easily identified for purposes of differentiating between survival of test organisms and possible contamination. There is, however, no reason why any type of culture might not be substituted in this procedure. The interpretations would vary accordingly.

Since *Escherichia coli* has been reported^{12, 39} to have approximately the same resistance as certain Gram-negative non-sporulating pathogens, it would seem that a germicide, in order to be considered for use should effect a 100 per cent kill of a test organism (about 100 million per ml.) similar in resistance to *Escherichia coli*²² in certainly not more than about 30 seconds at the concentration to be used when diluted in the water actually employed in sanitizing food utensils. If a germicide effects such a kill in 30 seconds, it would appear safe to assume that in actual food utensil sanitizing procedures an exposure of 2 minutes⁷ would be satisfactory for ordinary non-spore-forming pathogenic organisms. Further testing with pathogenic bacteria, however, will indicate more exactly what these limits are. The 1½ minutes additional time, plus the fact that the load is probably maximum would appear to offer an adequate margin of safety. Compounds not effecting a 100 per cent kill in about 30 seconds would appear to require increased concentration if only a 2 minute exposure period is maintained. Undoubtedly, compounds requiring 5 minutes for a 100 per cent kill would be unsatisfactory in the concentration employed; even the slow-acting chloramine T solutions were effective in 200 p.p.m. in 2 minutes.

When interpreting end points with the survivor curve, care must be exercised not to be confused by organisms splashed on the walls of the tube and thus not properly exposed to the germicide. Repeat tests will usually clarify discrepancies. A test organism such as *Escherichia coli* may be easily distinguished from air contaminants. An occasional single colony on an otherwise sterile plate may be fished for identification and, if necessary, a repeat test made.

Germicides proving to be satisfactory by the laboratory procedure should be carefully observed by the swab-rinse plate count procedure²⁷ under actual conditions of practical application. Under practical conditions the "life" of a germicide may be effectively determined simply by removing some of the rinse after it has been used for dish sanitizing for a period, and testing it by this survivor-curve procedure.

In working with new types of germicides such as quaternary ammonium compounds with which there may be some question as to whether the apparent kill, as indicated by loss of reproductive powers when planted in a suitable medium, is only a bacteriostasis, there is considerable merit in withdrawing aliquots for plating after a very short period of exposure, e.g., 15 seconds. If it can be demonstrated that the organism is capable of reproducing when plated after 15 seconds' exposure, but not after 30 seconds' exposure or longer exposure periods, it would indicate that fewer survivors remain with time. On the other hand, if the initial plating is made only after complete kill has been obtained, there may be some question, particularly with an inexperienced worker, as to whether the medium will actually support growth and all bacteriostatic action has been eliminated. Actual presence of colonies on plates representing a very short exposure period serves as a control for bacteriostasis and gives

ample proof that the test organism was not omitted.

A plate count made after 15 seconds' exposure also has another value. It has been observed that by actual timing in railroad dining cars and in other food establishments in some instances food utensils were submerged in the germicide for only 12 to 15 seconds. Undoubtedly, however, the germicide adheres to the glass and exerts a certain degree of effectiveness for a period after being removed from the germicide bath. Thus, the need for germicides effective in very short periods of time is evident. Through the use of testing procedures such as we have described, effective compounds may be discovered.

SUMMARY

A laboratory procedure is described for evaluating practical performance of quaternary ammonium compounds, hypochlorites, chloramines (including Chloramine T), or other germicides used for food utensil sanitizing. This simplified procedure has been devised by incorporating or modifying essentials applicable from several procedures previously proposed by others. Only a small volume of germicide-bacteria mixture (10 ml.) is required. Tests are made at 25° C. employing equipment ordinarily available in any bacteriology laboratory. Standard procedures and media were adopted where possible.

Limited comparative studies indicate that the time required to give a 100 per cent kill employing a special strain* of *Escherichia coli* (or a test organism of comparable resistance) in a concentration of about 100 million per ml. in the water in which the specific compound is to be used serves as a measure of the exposure time required for sanitizing food utensils under comparable conditions of temperature and concentration of germicide. Inferior compounds fail-

ing to kill in the exposure time provided may be tested with higher concentrations if it is desired to find the effective concentration necessary. It would appear that really effective germicides for food utensils should exhibit their germicidal activity by completely killing the test organism under standard conditions as described in about 30 seconds, and with such germicides the longer exposure times required in actual food utensil sanitizing regulations should provide a margin of safety, assuming adequate cleaning of utensils and their freedom from non-compatible detergents.

"It is, of course, obvious that a solid material foundation is an essential basis for a high civilization; but it is a basis, not a superstructure. Our tendency is to confuse one with the other, to mistake the foundations for the towers and turrets of the new city.

"There is a spiritual hunger in the world today that is not being satisfied by American exports. 'God knows we

need food and coal to survive,' said a European delegate to Lake Success, 'but unless America can take the lead in providing a vital faith, in giving us a song that mankind can sing, all her exports will merely postpone the day of reckoning, and the world will die anyway.'" — Raymond B. Fosdick, *Rockefeller Foundation—A Review for 1947*.

Suggested Techniques for Inducing Navaho Women to Accept Hospitalization During Childbirth and for Implementing Health Education*

FLORA L. BAILEY, PH.D.

Tuscan School, Maplewood, N. J.

SOME interesting and valuable suggestions on the implementation of health education and medical procedures among the Navahos have been made by Alexander and Dorothea Leighton.¹ Since I agree with them that a sympathetic approach to this important problem is necessary, I should like to offer a number of additional suggestions based on my investigation of the beliefs and practices of the Navaho Indians pertaining to the reproductive cycle.[†] This material was gathered from three areas in New Mexico, namely the Ramah, Pinedale, and Chaco Canyon regions. Sixty-six informants, both men and women, furnished the data. The investigation was made with a view to laying the background for a better understanding of Navaho attitudes toward health and particularly toward the problems of childbirth. Hospitals which serve the Navahos, both government and private, have made efforts to inculcate certain health principles into the minds of

those whom they contact but the extent to which they have been successful is undetermined. Recent figures estimate that perhaps 25 per cent of the women seek medical assistance during childbirth.

In analyzing the data, a considerable degree of homogeneity of belief was found to exist, with certain deviations of opinion surrounding the central pattern. Definite patterns of thought, however, could be distinguished throughout all the material. For example, Navaho beliefs and practices pertaining to the reproductive cycle are dependent upon mythological and religious sanctions. Pregnancy restrictions and behavior patterns for facilitating delivery are based on the premise that *like produces like*, or that an effect resembles its cause, and various forms of sympathetic magic are indulged in so that nature will be forced into the path which is desired. It was also discovered that there is a strong emotional response in relation to hospitalization and medical aid. Although many informants did not refer to hospitals, others expressed a violent feeling either for or against these institutions and even mentioned individual doctors by name, discussing them with strong feeling.

Because certain Navaho practices are sanctioned by mythology and reinforced

* This paper was presented before the Section on Anthropology of the American Association for the Advancement of Science at the One Hundred and Fourteenth Meeting in Chicago, Ill., December 26, 1947.

† The writer is indebted to Dr. Clyde Kluckhohn of Harvard University and Dr. Leland C. Wyman of Boston University for their encouragement and advice in the conduct of this study.

by ritual, they offer great resistance to change unless such changes can be made to fit the pattern of Navaho logic rather than that used by administrators of educational and medical programs. It is suggested, therefore, that medical workers and health educators accept without adverse comment the pregnancy restrictions and rules of conduct which are traditional with the Navaho. Then, using a pattern of logic which parallels that expressed in Navaho thought, they could present new restrictions and rituals based on modern medical knowledge which would assist the woman to achieve the desired result, namely, the safe and easy delivery of a healthy child.

Specific recommendations, based on these conclusions, have been proposed and will be presented here in conjunction with the native practices which can be used to reinforce or redirect the pattern.

It is of primary importance to gain the support and confidence of influential members in each family group if a program of health education is to be successfully implemented. Group decisions in matters of health are a common practice when a healing ceremonial is involved. There is considerable carry over, it is safe to venture, in decisions regarding hospitalization. There is little doubt that many women would welcome medical advice and assistance during pregnancy and childbirth if they had the support of older members in the family and heard favorable reports from those of their friends who had experienced hospital care.

One "singer" reported, "For a while, after one woman around here had gone to the hospital and come back with the news that they gave her something to put her to sleep and she had no pain with the baby, many women thought it was better to go to the hospital than to stay home." If, as a result of one woman's confidence and satisfaction,

"many" women wish to make use of medical assistance, it should be a matter of principle for each woman receiving help to be sent away feeling secure and happy so that her enthusiasm would create support and confidence among her neighbors.

In explaining why women hesitate to make use of medical facilities the statement was made, "Women know what to do at home, and they don't know about hospitals, so they don't go to hospitals." This, according to Dr. Clyde Kluckhohn's analysis of Navaho thought patterns,² is a basic reaction closely linked with others by which they win security. Regarding unfamiliar human beings as threats the women withdraw and do nothing when confronted with a new and potentially dangerous situation. Facing such a situation, with which she feels unable to cope, the woman solves her problem by refusing to have anything to do with doctors. The medical staff, by anticipating this reaction, could prepare the way for a more constructive solution of her problem through field clinics, individual conferences, and educational procedures designed to reassure the patient through an explanation of hospital routine.

Even a white patient, entering a hospital for the first time, is confused and apprehensive if the routine has not been explained. How much greater must this apprehension be for a woman who enters an alien world where the language is strange, where nothing fulfills her expectations of how things should be done, and where she is liable to "ghost infection" (as the Navahos term the disease) if she comes in contact with articles previously used by those who have died there.

After orientation and reassurance have been given her, the staff of the hospital, or the visiting field worker, should continue to seek ways of reinforcing the woman's emotional security and peace of mind. The fear and

anxiety of pregnant women in connection with hospitalization could doubtless be reduced by encouraging early admittance, thereby lowering the mortality rate. Reports show that the majority of maternal deaths in the hospital are caused by a retained placenta since the women are so afraid to face an unknown situation that they arrive at the hospital only in time to die there. One young woman remarked, "If a baby doesn't come for two or three days they get scared and go to the hospital." This tendency to seek hospitalization only in an emergency, or if death is imminent, is not unusual. As a result, one hears such bitter reports as that which came from an older woman who had lost two daughters in childbirth at the hospital after each had successfully delivered other children at home. Obviously, in her opinion, there was only one deduction—the white doctors had killed her daughters!

Any effort made by health educators, therefore, to persuade women to seek hospitalization at the proper time would be valuable in that rumors of death due to the fault of the hospital would be minimized, and the fear which serves as an emotional block for some women could thereby be counteracted.

One anxiety, however, which might be exploited in persuading women to accept aid is the extreme fear of contact with the birth discharge. It is linked with the even greater fear of contact with menstrual blood. One man reported, "This blood is not as bad as menstrual blood but it will break the back or the breast." The "breaking" thus referred to is *arthritis deformans* for it is believed that deformation will result from contact with the birth discharge. Other ill-effects were detailed by a young woman as follows: "If a ghost-bird, or a bluebird, or a coyote eats it, the woman won't get well for a long time; she stops having babies; it gives the woman more

pain; it kills the mother; the baby won't have any sense; it will cripple animals; and witches will get it." In the face of such formidable dangers which follow the improper disposal of the birth discharge, medical authorities might offer to relieve the woman of this responsibility, assuring her that if she comes to the hospital the nurses would take care of the disposal, thereby avoiding the possibility of exposing any of her family to contact with the blood and the resulting infection.

In dealing with patients during pregnancy, as well as after their admission to the hospital, it is important to phrase medical suggestions in terms of Navaho logic. For example: Navaho methods of keeping the fetus small, to insure an easy delivery, include hard work, exercise, and not sleeping in the daytime, as well as the magical application of certain medicines which work on the *like produces like* formula such as sucking honey from the pentstemon (called hummingbird's food) or eating a hummingbird's egg, shell and all, because this bird is so tiny. If the medical worker suggests other methods such as moderate exercise, the use of vitamins, or an increased calcium intake, he might explain them by using the Navaho phraseology, "It will make the baby strong, even though he remains small, so he will be born easily." It might also be pointed out that exercise keeps a person lean and in good condition, therefore it would, as they say, "keep the baby small."

There are certain parallels between Navaho and white medical practice which might be capitalized on by the hospital staff to expedite the delivery in a manner satisfactory to all concerned. Since the woman is accustomed to the native pattern of male assistants in the *hogan*, the presence of a male physician should be acceptable to her, and the Navaho practice of manipulating the abdominal walls in order to

secure a favorable presentation could be related to any similar manipulation which might be undertaken by the doctor. Both these patterns have mythological sanction, for Washington Matthews notes that abdominal manipulation to secure a favorable presentation was used by the two male gods, Talking God and Water Sprinkler, when they assisted at the delivery of Changing Woman and White Shell Woman.³

Native forms of modesty should be respected for a Navaho woman expresses her modesty in a slightly different manner from a white woman. That is, she does not consider exposure of the breasts an immodest act but places great emphasis on being adequately covered from waist to ankle. In their ceremonials women strip to one or two skirts and are very skillful in participating in events, even in the ceremonial bath, without exposing the lower part of the body. It is not strange, therefore, that hospital procedures involving a short bedgown and exposure during nursing care should be disliked. Manual examination should be undertaken with as little exposure as possible. However, since women are accustomed to a "singer" pressing and manipulating the body for ceremonial purposes, the doctor might minimize his problem by relating his examination to some such act with which she is familiar.

If internal version is indicated there is precedent in native practice for this also. Cactus salve is rubbed on the hands to make them slippery and the midwife then reaches into the orifice, using her hands as forceps, to deliver the child. However, one woman said, "It is a bad thing to reach in for the baby. I saw it done and it killed the woman." It should be explained to the patient, therefore, that under sterile conditions such emergency measures involve less danger than she anticipates in the *hogan*.

Navaho medical practices include the application of medicines externally and drinking of draughts during the period of pregnancy as well as at the onset of labor. Thus, any medicine which needs to be administered could be given with the explanation that it will, as the Navahos say, "help bring the baby easier," or "bring the placenta right away," or "stop the pain and clean out the blood." These are the results toward which their native medications are oriented and will, therefore, have meaning for them. No more than the exact amount, however, should be left where the patient has access to it, unless drinking a large quantity will make no difference, for the usual dose of native medicine is prescribed as "drink lots of it, drink one or two cups of that medicine."

If there is need for the use of diathermy, x-ray, or similar treatments these might be related to the healing properties of the sun prominent in Navaho ceremonial lore.

Since women are used to hot applications (made by heating the branches of juniper and packing them around the body) a parallel will be easily grasped, if heat needs to be applied, by using the Navaho cliché, "it will stop the pain."

If lacerations occur it is customary to use lotions, salves, or dusting powders. Steam baths, produced with water and herbs called Life Medicine, are also recommended. If similar treatments, ordered in the hospital, are tactfully introduced, objections might be avoided. Surgery, however, is not a native practice and this would have to be presented as a special technique used by white doctors.

A few days after delivery the woman takes a bath in certain herbs, including those called Life Medicine, to counteract the danger from contact with the birth discharge. It would be easy for a nurse to mention that the daily bath

water contained a kind of Life Medicine possessing purifying qualities, thereby easing the patient's mind.

If a woman does not have sufficient milk to nurse her child she may resort to artificial means of increasing lactation. This follows the familiar pattern of *like causes like* since liquids (particularly soups) are taken internally, and milkweed plants are applied to the breasts. On the basis of Navaho logic, therefore, the staff could introduce milk into the diet or, if desirable, force liquids. Certain other practices which have mythological sanction and therefore deep emotional significance for the parturient might be permitted, or even suggested, by the medical staff. If the doctor, for example, would advise the woman to have a Blessingway ceremonial sung for her, prior to entering the hospital, it would fall into a pattern which is familiar to her and make her feel that there was sympathetic coöperation between the white doctor and the native "singer."

The kneeling position, which the woman by tradition assumes for her delivery, has mythological sanction and is more in keeping with her sense of modesty than the modern obstetrical position. If the hospital could adapt its methods to allow delivery in the native position it might reduce emotional tension and prove valuable psychologically. Perhaps the dragrope, which in the legend was either a rainbow or a sunbeam, could be adapted for the woman's support, and certainly such small rituals as placing pollen ceremonially on the objects to be used, or applying pregnancy charms to her body, could do no harm. Corn pollen, sprinkled on a living horned toad at the moment it is born and then gathered, is always carried by a pregnant woman for use in this emergency. They say, "Take live pollen from the horned toad's babies and when the pains begin the woman takes a pinch

and drops it inside her blouse because when the little toads are first dropped they can run away fast. They are strong." Mythologically the horned toad is protected against danger. For a nurse to suggest that the woman make use of such ritual assistance might easily serve to strengthen her feeling of security so that the subsequent ordeal would be eased.

Since the ritual act of *untying* plays an important part in native precautions at birth, if the woman were allowed to unbind her hair and remove her jewelry, and in cases of unusual emotional tension if the nurses would also make some gesture toward untying or unbinding their own persons, this would reinforce her morale.

The Navahos say, "No one should be around who gave any trouble to his mother at birth." Perhaps the hospital assistants could let it be known that they themselves had been born with great dispatch and little trouble. Anything that can be related to the *like causes like* formula would serve to bring reassurance.

That Navaho women find the smell of blood objectionable is evidenced by the fact that they use pungent herbs as an inhalant with the explanation that this will prevent fainting from smelling the blood. This may be partly psychological, related to the fear of contact with the birth discharge, but it would be easy to present the woman with a small bunch of sagebrush or a twig of wet juniper and might help her through a trying time. Familiar odors are known to be powerful stimulants to the emotions and would be gratefully welcomed in an atmosphere of strong, unfamiliar, and doubtless unpleasant odors.

One of the reasons women dislike hospitalization is that the food is unfamiliar and sometimes, to them, unpalatable. The food which the postparturient expects to receive imme-

diately after delivery is a ceremonial food sanctioned by mythology. It is a special type of blue cornmeal mush without the juniper ashes usually added to cornmeal breads. Any woman who has eaten mush ceremonially must eat it following childbirth. Where Navaho women assist in the hospital kitchens it should be possible to serve this specialty and thereby add to the patient's mental and physical comfort.

Since the woman is used to having the new-born baby close to her side it might be advantageous to let the infant remain near its mother in the hospital rather than to exile it to the nursery. This practice is not without precedent in certain modern hospitals where the philosophy of purely objective routine and seclusion for the infant has been replaced by one advocating closer physical contacts.

Molding or pressing the body of the new-born baby is believed to produce strength and beauty. This manipulation is based on mythology, being related to the pressing in the "Girl's Puberty Rite." Women who have had children born in hospitals say that the children did not develop normally due to lack of this ritual. One young mother said, "You press his forehead, and nose, and body to make him beautiful. My oldest girl was born in the hospital and they didn't do that to her, and her nose is little and her forehead sticks out." Certainly it would do no harm to suggest this ritual pressing and would satisfy a need.

Legend tells us, "It is thought the

sun fed the infant on pollen, for there was no one to nurse it." This statement gives the sanction for the first food given to the child. Allowing the mother to offer a pinch of corn pollen to her baby would do him no harm and might do the mother considerable good. It might be practical, also, if the mother has enough milk, to allow her to nurse the child whenever it cries. This would follow a familiar native pattern yet would not be out of line with the newest practices in child care.

If the mother remains in the hospital until after the navel of the infant has healed it is important that the cord be given her to take home rather than discarded. The strong emotional tone in which the magical properties of the cord are discussed would indicate that coöperation in its proper ritual disposal would be appreciated.

When the mother and child are discharged from the hospital it is to be hoped that confidence will have been established between the medical advisor and the Navaho patient. Toward that end the preceding recommendations have been offered with the hope that they may point out specific ways of adjusting one culture to another and of lessening the tensions which are inevitable from such contacts.

Results and Problems after Four Years of a Conservation of Hearing Program

WILLIAM R. WILLARD, M.D., F.A.P.H.A., AND
DONALD F. PROCTOR, M.D.

Department of Public Health, Yale University School of Medicine, New Haven, Conn., and Department of Otolaryngology, Johns Hopkins Hospital, Baltimore, Md.

IN February, 1943, a program for the Prevention of Deafness in children was started in Washington County, Maryland. This was the first program of its kind, with an emphasis on medical treatment, financed by the Children's Bureau and conducted by a health department as one of its services for crippled children. This administrative study covers the first 50 months of operation. It is based on a review of the 1,084 clinic records and other information obtained in the county; 1,035 of the 1,084 records were sufficiently complete to tabulate.

DESCRIPTION OF THE AREA

Washington County in western Maryland is a typical American county in many respects. The population was 68,064 in 1940 (estimated as high as 73,130 during the war) with 2.5 per cent colored. About one-half of the county's population is in the City of Hagerstown; the rest is rural.

The county has an effective, stable County Health Department supported by city, county, and state funds. During the period of this study, the staff included a full-time health officer, 5 public health nurses and clerks. A medical stenographer and hearing technician, added when the program began, gave approximately half time to the program. There was no medical-social service worker or nursing supervisor, but the latter has been added since.

The Health Department building contained adequate clinic facilities. The county has a 158 bed hospital. There were about 50 physicians, including 4 ear, nose, and throat specialists (63 physicians and 6 specialists since the war). Relationships of the Health Department and medical profession have been excellent.

ORGANIZATION OF THE PROGRAM

The program required almost 9 months of preparation, devoted chiefly to planning clinic organization and conferences with most of the physicians in the county. A special meeting for the ear, nose, and throat specialists was addressed by the prospective clinician and a specialist from the Johns Hopkins Hospital. The program was endorsed by the County Medical Society, and the services offered have been used extensively by physicians of the county.

The following services were provided: (1) case finding; (2) a clinic for diagnostic ear, nose, and throat work, and radium treatment of adenoid tissue; (3) public health nursing service; (4) hospital, surgeon, and anesthetist services for those needing surgery but unable to pay for it; and (5) hearing aids for those unable to afford them. It was hoped that the Board of Education would develop speech reading, speech training, or other rehabilitation services but these have not yet been provided.

THE CLINICIAN

The clinician for such a program should be interested in hearing conservation, and adequately trained in management of clinical problems, use of the nasopharyngoscope, the administration of radium therapy, and the testing of hearing. It may be difficult to find a suitable clinician.

Our clinic was staffed for 3 years by an otolaryngologist on the clinical staff of the Johns Hopkins Hospital and Medical School, who had the advantages of good training and enthusiasm. Being an outsider who was not competing with the local medical profession, he maintained a neutral position with the physicians. When other responsibilities made it impossible for him to continue as clinician he was replaced by a resident otolaryngologist on the Johns Hopkins Hospital staff. Since that time, by special arrangement, the Hospital and Medical School have provided the services of a clinician from the resident staff.

This pattern has the advantage of insuring to the clinic competent medical services. It has the disadvantage that clinicians change each year, occasionally more often. This has not been a serious drawback, especially since the original clinician is now a consultant for the State Health Department and visits the clinic periodically.

Such experience is invaluable to the resident, enabling him for the first time to participate in a community medical program under supervised field conditions. It gives him also an appreciation and understanding of a public health program which too few physicians have.

It strengthens the position of the University Medical Center in the minds of the public and the medical profession by bringing service to those not otherwise having access to it. Also, it directs to the Medical Center a certain amount of clinical material valuable for teaching and research purposes.

This pattern has applications broader

than those of a Hearing Conservation Program.

CASE FINDING

Cases were obtained by (1) referrals from teachers and nurses; (2) referrals from private physicians; and (3) audiometric screen testing of all children in the 3rd and 6th grades (about 2,800 children annually) and others selected for testing by teachers. Children were referred to clinic through the family physician if they had one, or by nurses or teachers if they were observed to have earaches or discharge, defective speech, poor behavior not otherwise explained, frequent colds, mouth breathing, chronic cough, or hearing impairment. The source of clinic patients is shown in Table 1.

TABLE 1

Source of Referrals of Clinic Patients

| | <i>No.</i> | <i>Per cent</i> |
|-------------------|-------------|-----------------|
| Screening | 269 | 26.8 |
| Nurse | 180 | 17.9 |
| Teacher | 77 | 7.7 |
| Private physician | 423 | 42.1 |
| Others | 55 | 5.5 |
| | <hr/> 1,004 | <hr/> 100.0 |

The records often did not state the ultimate source of referral, and it is possible that some children referred by screening or by nurses, should have been credited to teachers and vice versa. In some schools as high as 25 per cent of the children screened were referred by teachers from grades other than 3rd or 6th, and in other schools no children were so referred, pointing to the need for further educational work with teachers. The average was about 15 per cent.

Referrals from private physicians during the earlier years of the program were so numerous that it was difficult to see other patients who might be in greater need of service. To meet needs of patients with known hearing impairments or ear infections, it was necessary to use a priority system in scheduling appointments. One-third of all patients referred by private physicians were in

the preschool age, where the opportunity is greatest for doing preventive work by treating conditions predisposing to infection and impaired hearing. As care is provided for the backlog of neglected children in a community, preschool patients referred by private physicians become increasingly important.

Children were screened individually with a pure tone audiometer (Western Electric 2 A) frequencies 512 and 8,192 plus a spoken and whispered voice test. Tests were done in the schools using the quietest room available. Any child with a threshold loss of 25 or more decibels on either frequency was given a complete test. If the child had an upper respiratory infection the complete test was postponed for 4-6 weeks. Any child with a threshold loss of 25 or more decibels on any frequency on the complete test, except for a 4,096 dip, was referred to the clinic. Also, those without hearing impairment but thought to suffer from conditions predisposing to hearing impairment were similarly referred to clinic.

Table 2 shows that the number and per cent of children referred to clinic as a result of screening dropped sharply over a 3 year period. This downward trend is in accord with the experience of others. Much of the backlog of impaired hearing is identified rather quickly and then the findings reflect more nearly the annual increment of defects.

Of 368 patients who had a complete audiometric test prior to their first clinic examination, 190 or 53 per cent waited more than 3 months for their

first examination and 65 or 18 per cent waited 9 or more months. In some instances the children who waited had rather severe hearing impairments. This delay is a reflection of several factors: (1) heavy demand for clinic appointments; (2) indifference on the part of some families; (3) inadequate attention to scheduling these children; and (4) inadequate follow-up.

Any program should provide a reserve audiometer to be used during a semi-annual recalibration of the regular equipment. Also, audiometers occasionally need repair and reserve equipment is important if occasional serious delays are to be prevented. Over 4 months were required recently to effect repairs in the audiometer; meantime the hearing technician could not do her work.

CLINIC SERVICE

The clinic was staffed by the clinician, medical stenographer, nurse, and audiometric technician. The nurse took a preliminary history on the patients, and the stenographer took dictation for the patients' records, and sent a report to the referring or family physician promptly after clinic was over.

The clinic operated on an appointment basis. Data are not available as to the proportion of broken appointments, but for some clinics they ran as high as 25 per cent and allowances were made in scheduling appointments. Patients seldom waited long at clinic and, due largely to the efficient preparation by the nurse and stenographer, the clinic has run smoothly and rapidly.

The clinician was equipped to do a

TABLE 2

Number of Children Screened for Hearing, Number and Per cent Referred to Clinic

| <i>School Year</i> | <i>No. New Children Screened</i> | <i>Number Referred to Clinic</i> | <i>Per cent Referred to Clinic</i> |
|--------------------|----------------------------------|----------------------------------|------------------------------------|
| 1944-1945 | 1,616 | 167 | 10.3 |
| 1945-1946 | 3,118 | 112 | 3.6 |
| 1946-1947 | 2,881 | 72 | 2.5 |
| | <hr/> 7,615 | <hr/> 351 | <hr/> 4.6 |

complete office examination, including the use of an electric nasopharyngoscope, and to give radium treatment for adenoid tissue. X-rays were obtained by contract with the hospital (located in an adjacent building).

As expected, the proportion of return patients to new increased with the age of the clinic. For every 100 new patients 124 return patients were seen in 1943 in contrast to 430 in 1947. This was largely due to the desire to follow patients as long as possible even though no treatment was given. It is not known yet at what ratio this will level off. Return and new patients together required an average of 10 minutes per examination which is faster perhaps than most clinics could handle a patient satisfactorily. Twelve to 15 minutes would seem a more reasonable figure for planning purposes.

Two all-day clinics a month were held during the first two years. During the war there was some curtailment of service, but the original schedule has been resumed. Because of the backlog of accumulated neglect which can be found easily in any community which has lacked an ear, nose, and throat program, the load should be heavy during the early years of a program. An all-day clinic a week for the children from a county of 70,000 would not be too much at first.

By age the children attending clinic

were well distributed, 17 per cent were of preschool age; 34 per cent were of age 6-9 years; 29 per cent 10-13 years; 9.7 per cent 14-20 years; and 9.7 per cent were 21 or above. The adult group was not eligible for service, strictly speaking, but staff members, physicians, and their families could not be refused, and some adults were seen in consultation. Logically, service for adults should be offered in such a clinic. The demand for adult service is great.

Males and females were seen in about equal numbers, as were rural and city children.

CLINIC FINDINGS

Although no attempt is made to evaluate therapy in this report, clinic patients have been compared on the basis of initial and final audiograms. Whereas only 28.6 per cent of 443 patients were found to have normal hearing on the initial examination (no loss exceeding 20 decibels on any frequency), 63.0 per cent were normal on the final audiogram. These figures are presented without regard to treatment received, duration under supervision or other factors. Had each patient received adequate treatment, the results might have been better.

It was judged that in 551 of 663 cases, or 83 per cent, the hearing impairment could be attributed to upper respiratory infections including otitis media. This is shown in Table 3.

TABLE 3

Etiology of Hearing Impairment

| | <i>No. Patients</i> | <i>Per cent</i> |
|----------------------------------|-------------------------|-----------------|
| Conductive impairment | | |
| Otitis media unclassified | 551 | 83.3 |
| Stenosis external auditory canal | 7 | 1.0 |

TABLE 4

Number and Per cent of Clinic Patients with Treatment Recommendations and Treatment Received

| | Recommendations | | Treatment Received | |
|----------------------|-----------------|---------------------------------|--------------------|--|
| | No. | Per cent of all Clinic Patients | No. | Per cent of Those for Whom Recommended |
| T & A | 463 | 44.7 | 317 | 68.5 |
| Hearing Aids | 25 | 2.4 | 10 | 40.0 |
| Mastoidectomy | 9 | 0.9 | 3 | 33.3 |
| Sinus Surgery | 11 | 1.1 | 5 | 27.2 |
| Submucous Resection | 27 | 2.6 | 5 | 18.5 |
| Allergy Consultation | 43 | 4.1 | 14 | 32.6 |
| Chest Consultation | 10 | 1.0 | 6 | 60.0 |
| Radium Treatment | 461 | 44.5 | 461 | 100.0 |

TREATMENT RECEIVED

In Table 4, clinic recommendations and treatment received are tabulated. T & A and radium therapy were each recommended to about 45 per cent of the clinic patients and were secured in 69 per cent and 100 per cent of the cases respectively. This does not imply that 100 per cent received adequate radium therapy; merely that they received at least one treatment.

Radium is an acceptable form of therapy and comparatively few patients will drop out after just one treatment. Of 461 patients receiving radium, the largest number, 110, received three treatments; 161 received four or more; and 19 received six or more treatments.

Hearing aids were secured through the Baltimore League for the Hard of Hearing and each fitting necessitated several trips by the patient of approximately 65 miles to Baltimore. When necessary, the aid was purchased by the State Health Department with crippled children's funds. One was secured by only 10 out of 25 patients for whom it was recommended and in at least 3 instances, possibly 5, the aid was not used after it was obtained. This poor showing is in part caused by the difficulty of going to Baltimore and in part to inadequate interpretation, to the patient of his need, and lack of supervision in the use of the instrument.

Provision of a hearing aid in itself does not solve the problem for many hard-of-hearing children.

It would be a substantial addition to the program if the technician were trained to help in selection of hearing aids, so that this could be done locally. More aids would be fitted and better service provided. However, this plan should be coördinated with the state voluntary agency for the hard-of-hearing, which may be prepared to render this service, but often is not represented in smaller cities or rural areas.

ECONOMIC STATUS

Services for crippled children of the State Health Department paid fees for hospital, surgeon, and anesthetist for patients who were certified by the County Welfare Department as eligible for care. Thirteen per cent of all clinic patients were certified as eligible.

In an effort to measure the relationship of economic status to the receipt of treatment, patients were assigned to 3 groups: (1) certified by the Welfare Department; (2) not able to pay; (3) able to pay. The assignment was made by the public health nurses according to their judgment, and not as a result of a financial investigation. The "not able to pay" group were believed to constitute a higher economic level than those "certified," and the "able to pay"

group represented largely those referred by private physicians.

As shown in Table 5, the *certified* group received a T & A when recommended in 81 per cent of the cases, the *able to pay* group 58 per cent, and the *not able to pay* group 43 per cent.

TABLE 5

Number and Percentage of Patients Who Received a Recommended T & A by Economic Status

| <i>Economic Status</i> | <i>No. Recommended</i> | <i>No. Received</i> | <i>Per cent Received</i> |
|-----------------------------|------------------------|---------------------|--------------------------|
| Welfare Dept. Certification | 107 | 87 | 81 |
| Not Able To Pay | 230 | 99 | 43 |
| Able To Pay | 105 | 61 | 58 |

This suggests that the economic barrier may be serious in preventing patients from securing needed therapy. This conclusion is strengthened by an examination of policies governing certification. As is customary with welfare work, the patients must take the initiative and apply in person for certification at the Welfare office. It is well known that some persons because of charity implications in this procedure will not apply. Others are indifferent, and especially if they live at some distance, will not make the effort to be certified.

Although many factors were considered by the Welfare Department in determining eligibility, in general the following schedule was used:

| <i>Size of Family</i> | <i>Maximum Income for Eligibility</i> |
|-----------------------|---------------------------------------|
| One | \$1,525 |
| Two | 1,575 |
| Three | 1,725 |
| Four | 2,050 |
| Five | 2,350 |
| Six | 2,675 |

This scale in June, 1947, had not been adjusted since 1943, and with higher living costs, seemed much too low.

This points to the need for more flexible criteria which should be applied by a medical-social worker, preferably one integrally associated with the program.

NURSING AND MEDICAL-SOCIAL SERVICE

Nursing visits were made to help in securing corrections and for other services in connection with the program. With only 5 nurses (one per 14,000 population), each carrying a generalized program, it was inevitable that the intensity of service would be low. They visited only 27.5 per cent of patients enrolled in the clinic, but for each case admitted to nursing service an average of 3.4 visits were made.

A study was made of nursing visits relative to success in securing recommended T & A's, which showed that (1) a substantial number of patients for whom a T & A was recommended were not visited (usually the need for a T & A was not considered urgent in these patients); (2) there was comparatively little difference in number of visits made per patient to those who did and did not receive a T & A; (3) very few patients in the "able to pay" group were visited. Since most of these were private patients, this finding is not surprising in view of the shortage of nurses' service.

These figures emphasize the need for careful case studies by a medical-social worker as to why patients do not receive recommended therapy. There are factors blocking the receipt of therapy which the nurse alone cannot solve and with which a medical-social worker could help. It is probable that many of the fruitless visits to patients who did not receive therapy could be avoided, if these factors were clearly recognized. It is estimated that one-fourth to one-half the time of a medical-social worker could be advantageously employed in this program.

It is also clear that there is an unused opportunity to provide nursing service to private patients. To do this will require some education of the physicians, and good relationships between health department and physicians. It will also require more nurses, and a breaking of the local tradition that

nursing service is primarily for the poor.

It is estimated that the nursing hours devoted to this program, counting clinic and field time, were equivalent to one-third the time of a full-time nurse. It is further estimated that the equivalent of the full time of one nurse in this county of 70,000 would have resulted in adequate nursing service.

NEED FOR GENERAL MEDICAL SUPERVISION

For best results, patients under specialized care as in an ear, nose, and throat clinic should be under general medical supervision. This is emphasized by the fact that patients gave histories of the following conditions: Allergy, 68 times; heart disease, 19 times; tuberculosis, 5 times; suspicious bronchiectasis, 12 times; and other significant conditions, 45 times. Approximately 14 per cent of clinic patients gave histories of potentially important conditions outside the ear, nose, and throat.

No general medical supervision was available in Washington County except that provided by the private practitioner. Forty-two per cent of patients were referred by private physicians and presumably were under care, but in most instances the clinic had no official record of the physicians' findings. The other 58 per cent of the patients presumably were not under medical supervision. Such supervision should be provided by clinic service if necessary and adequate records of the finding should be available to the clinic.

RECORDS

Although it was assumed that the clinic kept good records, this study clearly demonstrated their inadequacy for administrative and research purposes. A study similar to the one reported here is the best way to reveal such deficiencies, and is useful in planning better records. Because there are

many unknowns in the prevention of deafness, it is urged that all similar programs include administrative and clinical research as well as service. It is helpful in planning the records to define in advance some of the research problems to be undertaken. This is now being done in Maryland on a state-wide basis in conjunction with a revision of the *record form*.

REHABILITATION

The most conspicuous gap in the program at present is that of rehabilitation, especially speech reading and fitting of hearing aids.

The magnitude of this need can be estimated roughly from the data available. Had proper records been kept, a more precise estimate would be available. We know that 2.4 per cent of the clinic population was recommended for hearing aids. This proportion for the same age groups should gradually decrease as the preventive work continues.

By arbitrarily assuming that patients with a threshold of 35 or more decibels for 3 or more tones in the best ear need training in speech reading, it was calculated that 18 per cent of the clinic population needed this instruction judged by initial audiograms but only 10 per cent judged by the final audiograms. Thus, clinic attendance seemed to reduce the need for this service by almost 50 per cent, and probably the reduction would be greater if more patients completed recommended therapy. Ten per cent of the clinic population, age 6-20, is 76 patients who probably needed speech reading. If the number and age distribution of clinic admissions in the future approximate those of the past, 25 new patients a year would need speech reading.

Although it is recognized that there are many factors in addition to audiograms to consider in determining the need for speech reading for any child, it is believed that this calculation gives

figures useful for planning purposes.

In addition to these children, there were 39 children or 3.7 per cent of the clinic population with speech defects in need of speech training. Fourteen of these children had hearing impairments of 35 or more decibels with 3 or more tones, and all but 7 had some impairment.

Education departments are developing increasing interest in hearing problems of children. Many of them conduct extensive screening programs or are in a position to do so. It is important that health and education departments coördinate their programs so that duplication may be avoided, and so that each program will benefit from the activities of the other. The medical program should usually be conducted by the health department. The rehabilitation program involving speech training and lip reading usually should be conducted by the department of education, but certain phases of this work must be continually under medical supervision. The screening program in schools could be conducted by either department. If conducted by the education department, special arrangements must be made to reach children in parochial schools, and others not attending public schools.

A better quality of screening will result if a trained technician rather than a teacher or nurse does the work. It is suggested that in many communities the technician should be employed jointly by the health and education departments. Whether or not this is done, the program should be developed jointly by the two agencies. In many communities, as in Washington County, the health department clinic program will not keep a technician busy full time, and the rest of her time can be devoted advantageously to work in the schools. Obviously there is a real advantage in coöordinating the school screening program with the clinic program through such a person.

A complete program for the conservation of hearing requires skills in medicine, surgery, and psychiatry, in testing hearing and selecting hearing aids, in the teaching of speech reading, in vocational guidance and education. Thus, many professional skills must be brought to bear in a coördinated fashion if patients are to receive maximum benefit. Large centers should be developed in which these skills are available and co-ordinated for the development of service programs and research. Such centers, serving the civilians as veterans are now served in certain veteran facilities, logically should be located in our medical schools. Programs like that in Washington County should be closely affiliated with such centers serving in a sense as their field outposts.

FINANCIAL ASPECTS

The budget for this program year ending June 30, 1947, was \$7,040.20. This included \$2,313.35 for the clinician's salary, and fees to surgeons and anesthetists for surgical care provided. It also included \$560 for hospitalization. For the 6 months July 1–December 31, 1946, just under \$2,500 was expended with a somewhat reduced clinic program.

For a more complete program, including the equivalent of a full-time nurse, the half time of a medical-social worker, and a share of the time of a nursing supervisor, the budget would approximate \$10,000 for a county of 70,000 or about 14 cents per capita. To this should be added costs for rehabilitation estimated at \$10,000, raising the per capita costs to about 28 cents per capita. If more liberal eligibility requirements for surgical care were effected, the cost might go as high as 32 to 34 cents per capita. Assuming an ideal program for this county at \$25,000 a year, the average cost per patient admitted to clinic, would approximate \$9.60.

Fees were charged for clinic examinations and treatment but only when it

was believed the patient could afford to pay them. No financial investigation was made, and it was usually the private patient who was charged. The fee was \$5.00 for each clinic visit. Two hundred and seventy-three or approximately 25 per cent of all clinic patients paid such a fee. Only 11 patients who were billed failed to pay, and 3 of these paid partially. The minimum paid by any family was \$2.50, the maximum \$35. Of the families who paid, 53 per cent paid \$5.00. A total of \$2,609.75 was collected in 50 months, slightly more than \$600 a year.

This suggests that in prosperous times, clinic service alone on a modest scale could be supported by fees, but the entire program requires other financial support. There is considerable difference of opinion as to the desirability of a health department collecting such fees. The Children's Bureau is opposed to such a practice. Practising physicians, believing in the fee-for-service principle, urge it.

GENERAL APPRAISAL

In spite of shortcomings, this program has contributed materially to the medical care available in Washington County. It has been a major step in preventive medicine directed toward chronic respiratory and ear infections. There are few medical problems today which approach these in magnitude.

The clinic has given, and continues to give, needed consultation service for all types of ear, nose, and throat problems, and has made available radium therapy for adenoid tissue. The program stimulated 2 local specialists to secure their own radium, and one of them received his training in its use in the clinic.

Physicians, teachers, and the public are somewhat more sensitive to problems of impaired hearing, and because the surgery on clinic patients done by local physicians usually is reviewed in

the clinic, it is believed that the quality of work has been improved.

In short, this program has demonstrated in its field the practicability of providing specialized service and facilities available to, and used by, all economic classes of patients and many physicians. This has been done through the Health Department within the existing framework of private practice and not interfering with it. It is a pattern which is being increasingly used to bring to the people specialized services beyond the competence of the general practitioners but in a manner which the patient can afford, and which supplements rather than replaces the family physician.

Although this program is based on hearing conservation, in reality it is a generalized program for all ear, nose, and throat conditions. It would be well if the facts were recognized by calling it a clinic for prevention and treatment of respiratory and ear diseases, considering hearing conservation as one aspect only. These problems are not limited to children, and hearing impairments are more numerous in the adult than child population. The demand for adult services is great. The program should be broadened, as soon as financial support can be provided, to give services to all age groups.

Finally, it should be recognized that a specialized program like this will succeed best within an adequate public health program. The need for nursing and school health service, medical-social work, other clinics for consultation and for general medical or health supervision are so frequent and important, that the program is seriously handicapped without them. This point cannot be emphasized too much.

RECOMMENDATIONS

In reviewing the program the following administrative recommendations were made:

1. An extra audiometer should be available for use when the regular one needs repair or calibration.

2. It is extravagant to use a trained technician only half time on this program, and half time on clerical duties. There are so few trained technicians that full advantage should be obtained from her skill in the hearing conservation program either by screening school children in more grades, or by increasing the number of schools, serving adjacent counties if necessary.

3. School teachers should be given a better understanding of the symptoms of poor hearing among children, the significance of this program, and how to participate in it more fully. This is especially important in the case finding program, and in the handling of children with definite hearing impairments.

4. More prompt medical examination and closer follow-up is indicated for many children identified on screening examination as having impaired hearing, especially if the apparent impairment is large.

5. The services of a medical-social worker should be made available to this program.

6. A more flexible policy of eligibility for hospital and surgical care should be adopted and administered under the supervision of the medical-social worker.

7. A study should be made, with the help of the medical-social worker, of reasons why some patients fail to secure a hearing aid when one is recommended and others refuse to use one when secured. Although many of these reasons are self-evident, others are not and such a study would be educational to the staff.

8. Services equivalent to that of a full-time

public health nurse should be provided for this program in a county of 70,000.

9. General medical or pediatric supervision should be provided for all patients served, either through clinic services or private physicians. Adequate records of their findings and recommendations should be available to the ear, nose, and throat clinic.

10. The clinic records should be improved to permit clinical and administrative research which can be conducted in such a program. The record form should be standardized in all similar clinics in the state conducted by the state health department.

11. For planning and coördination, an active advisory committee should be developed in which the health department, the board of education, the medical profession, the public, and all other interested groups are adequately represented.

12. The policy of collecting fees for clinic service should be reëxamined by the advisory committee.

13. The most conspicuous gap in the program which should be filled is that of rehabilitation, especially speech reading.

14. The generalized public health program should be strengthened, because a specialized program like this one will succeed better where the public health staff and services are more adequate for a complete public health program.

NOTE. The authors wish to acknowledge the coöperation and work of the Washington County Health Department Staff, especially Mrs. Myrtle White and Miss Frances Grove, in the compilation of data for this paper.

Abortion as a Cause of Death

CHRISTOPHER TIETZE, M.D., F.A.P.H.A.

Research Associate, National Committee on Maternal Health, Baltimore, Md.

ABORTION affects population growth in 3 ways: (1) In each case by terminating the current pregnancy before the fetus has attained viability, (2) in some cases by making the woman sterile and thus preventing further pregnancies, and (3) by causing the death of a certain number of women. This article is devoted to a discussion of the third aspect only. It is based almost entirely upon published statistics from several countries and has as its objective the appraisal of abortion as a cause of death.

The term abortion as used in this article should be understood as including all terminations of intrauterine pregnancy before the twenty-eighth week regardless of cause, that is to say unintentional, therapeutic, and illegally induced abortions. Deaths from septic and nonseptic abortion will be shown separately. This distinction is important because of the close association known to exist between illegal induction and fatal infection.

All data will be presented in terms of annual mortality rates per million women of reproductive age (15-44 years). This method of presentation has been adopted by the Registrar General for England and Wales, whereas the National Office of Vital Statistics of the United States still adheres to the traditional procedure of computing mortality rates from abortion per 1,000 live births. The fundamental objection against the latter method is that a mortality rate should show the number of deaths in relation to the population exposed to the risk of dying, but women who have

carried their pregnancies to the point of termination by a live birth are precisely the ones who are not exposed to the risk of dying from abortion.

The mortality rate from abortion should not be confused with the fatality ratio of abortion. The latter can be computed from the number of deaths, if an adequate estimate of the number of abortions is available.

Table 1 presents the number of deaths assigned to abortion by the Bureau of the Census for each year from 1933 to 1945.¹⁴ In 1933 the death registration area for the first time included the entire United States. The table also shows mortality rates per million women 15-44 years of age. For comparison, rates for 1927-1928 have been added based upon the special investigation into maternal mortality undertaken by the Children's Bureau.¹³ This investigation included 15 states in all parts of the country. The population studied was slightly more rural than the United States as a whole but quite representative in its racial distribution and general level of maternal mortality.

To interpret correctly the numbers and rates presented in Table 1 it is necessary to consider the changes which have taken place in the classification of deaths from abortion. Prior to the Third Revision of the *International List of Causes of Death* adopted in 1920, deaths from abortion were not classified separately. They were included either with puerperal septicemia or with accidents of pregnancy, depending upon the presence or absence of infection. After 1920, nonseptic abortion appeared as

TABLE 1

Deaths from Septic and Nonseptic Abortion and Mortality Rates per Million Women, 15-44, in the United States, 1927-1945

| Year | Number of Cases | | Rate per Million Women | |
|-------------|-----------------|-----------|------------------------|-----------|
| | Septic | Nonseptic | Septic | Nonseptic |
| 1927-1928 * | | ... | 99 | 37 |
| 1933 | 2,037 | 540 | 67 | 21 |
| 1934 | 2,204 | 570 | 72 | 19 |
| 1935 | 2,167 | 602 | 70 | 20 |
| 1936 | 1,801 | 630 | 58 | 22 |
| 1937 | 1,531 | 532 | 49 | 19 |
| 1938 | 1,350 | 436 | 41 | 14 |
| 1939 | 1,393 | 393 | 44 | 12 |

| 1945 | 587 | 301 | 14 | 9 |

* 15 states

a subdivision of the accidents of pregnancy, but the much more important group of deaths from septic abortion was not shown. For this period the only information on mortality from abortion is that contained in the Children's Bureau publication previously quoted.

The Fourth Revision of the *International List* adopted in 1929 included two classifications in reference to abortion: Abortion with septic conditions and abortion without mention of septic conditions. These two categories have remained in use up to the present time. It must be understood, however, that statistics classified under the 1929 list are not comparable with more recent ones for the following reasons: (1) Abortions reported as criminal were not classified as puerperal deaths but as homicides. (2) Deaths due to premature labor or to hemorrhage of pregnancy were assigned to nonseptic abortion. (3) Death certificates on which nonseptic abortion appeared in conjunction with toxemia of pregnancy, placenta previa, perforation of the uterus, and certain other terms were not assigned to abortion but preference was given to the other cause mentioned.

The Fifth Revision of the *International List of Causes of Death* adopted

in 1938, and used in the United States since 1939, defined abortion as the termination of a uterine pregnancy prior to 7 lunar months or 28 weeks of gestation, retaining the division into abortion with and without mention of infection. Several changes were made in the lists of terms included under each title and in the rules for determining primary cause of death. As indicated above the results of these changes were the following: (1) Addition of criminal abortions previously classified as homicide. (2) Exclusion of premature labor and hemorrhage of pregnancy from nonseptic abortion. (3) Allocation of certain deaths to nonseptic abortion which under the rules of 1929 would have been assigned to toxemia, placenta previa, or other puerperal causes.

To make comparison possible throughout the series the mortality rates for the years before 1939 must be adjusted to the Fifth Revision of the *International List*. This adjustment has been made with the help of a special study published by the Bureau of the Census in 1944.¹² In this study the deaths of 1940 in the United States were classified according to both the Fourth and Fifth Revisions of the *International List* cross-tabulated. From this correlation it appears that only 1

would have been assigned to septic and 331 to nonseptic abortion if the Fourth Revision had been used in 1940 against 1334 and 348 deaths under the Fifth Revision. To make the series comparable, the number of deaths and the mortality rates from septic abortion were therefore increased by 15.8 per cent for the period 1933-1938 and those from nonseptic abortion by 5.1 per cent. For 1927-1928 the mortality rate from septic abortion was increased by 10 per cent to allow for deaths reported as criminal abortion and classified as homicide. No adjustment is needed for nonseptic abortion because the investigation by the Children's Bureau included all cases of abortion listed in conjunction with other puerperal causes but excluded premature labor and hemorrhage of pregnancy.

The first two columns of Table 2 present the adjusted series of mortality rates per million women of reproductive age for the United States as a whole.

The usefulness of official statistics for the study of the mortality due to abortion has often been questioned and some authorities have felt tempted to discount them altogether. Is this attitude justified by the facts? A careful appraisal of the available evidence is necessary to answer this question. Deaths from abortion may be assigned to other causes for various reasons: (1) Abortions reported in conjunction with a nonpuerperal cause of death which takes precedence over abortion. Such cases numbered 133 in 1940^{4a} which is 7.9 per cent of the number assigned to abortion. Of these 133 cases, 21 were assigned to tuberculosis, 18 to appendicitis, 14 each to syphilis and accidents, 11 to chronic nephritis, 9 each to cancer, heart disease, and pneumonia, 6 to hernia, 5 to nonmalignant tumors, 4 to suicide, 3 to diabetes, 2 each to typhoid fever and pellagra, and 6 to a miscellany of other diagnoses. This list suggests that in many of these

cases the abortion was listed either as a non-fatal complication of a fatal disease or as an unsuccessful therapeutic measure rather than the cause of death.

(2) Deaths reported as due to a puerperal condition but without mention of the fact of abortion or the period of gestation. Such cases are assumed to have occurred in the third trimester of pregnancy and therefore not classified as abortions. Errors of this type were found fairly frequently in the early studies of maternal mortality in the United States. They amounted to 20.9 per cent of all septic abortions in the survey of 1927-1928 made by the Children's Bureau, to 15.7 per cent of all abortions in New York City in 1930-1932,⁶ and to 14.9 per cent in Philadelphia in 1931-1933.⁷ Unfortunately no further such investigations have been published in more recent years. It is believed, however, that the strong efforts made by health departments and by the special committees on maternal mortality established in many cities have resulted in much more accurate reporting of puerperal deaths than was customary 15 or 20 years ago. In this connection it is worth noting that in 1945 more than 78 per cent of all deaths from puerperal causes occurred in hospitals against 55 per cent in 1927-1928.

(3) Deaths reported as septicemia or peritonitis without mention of pregnancy, childbirth, or the puerperal state. If such death certificates refer to women of reproductive age they are usually queried by the registrar and the complete diagnosis ascertained. Between the ages of 15 and 45 years, nonpuerperal septicemia appears more often as the cause of death for males than for females. It is therefore unlikely that many septic abortions are concealed under this diagnosis. For peritonitis of unknown origin, the Census Bureau regularly reports more deaths of women of reproductive age than of men. During the 3 year period 1942-1944

the average annual excess amounted to 100 female deaths. Of these, 40 occurred in white and 60 in colored women. A number of these deaths were probably caused by septic abortion. (4) A fourth group of deaths due to abortion but not reported as such are the cases where a false and apparently innocuous diagnosis is entered on purpose in order to conceal a criminal abortion. I do not believe, however, that this happens very often, especially in urban communities. As a rule a woman seriously ill after an illegal operation is not allowed to die in her home under the care of the abortionist or a conniving family physician but is taken to a hospital in an effort to save her. It is not possible to estimate the number of such concealed deaths. The late Frederick J. Taussig¹⁰ tried to do it by arbitrarily allocating one-half of the excess mortality of females, 15-44, over males from respiratory tuberculosis, diseases of the circulatory system, and acute and chronic nephritis to abortion; but his attempt is now only of historical interest. Dr. Taussig later admitted^{4b} that his estimate had been considerably too high.

The Registrar General for England and Wales recently¹¹ expressed the opinion that "there is no reason to suppose that the understatement of abortion on death certificates amounts to more than ten per cent" in that country. The data presented here suggest that coverage may be less complete in the United States. It is felt, however, that the official statistics include the great majority of all deaths from abortion. It should be noted that the mortality from abortion as reported is generally highest in those sections of the American population where omissions and errors may be assumed to occur most frequently. Furthermore—and this is most important—there is every reason to believe that the quality of death registration has improved a great deal during the

last 20 years. The outstanding fact about mortality from abortion is the steady and sometimes precipitous decline which has been observed almost everywhere. The reality of this decline cannot be doubted, and the extent of the fall is in all likelihood understated by the official statistics.

Four general statements can now be made concerning the development of mortality from abortion in the United States as a whole: (1) From 1927 to 1945 mortality from abortion has decreased by approximately four-fifths—from about 150 to about 30 per million women of reproductive age. (2) Mortality from abortion has decreased at a steadily accelerating pace, the rate per million women having dropped 32 per cent from 1927 to 1933, 44 per cent from 1933 to 1939, and 52 per cent from 1939 to 1945. (3) Deaths from septic abortion have outnumbered deaths from nonseptic abortion throughout the period at a ratio of about 3 to 1. (4) During the last few years, mortality from septic abortion has decreased much faster than mortality from non-septic abortion.

It is suggested that this development has been due to a combination of several causes. (1) Contraceptive methods have been improved and are more generally used than formerly. Fewer women, therefore, resort to illegally induced abortion. (2) Abortionists have become more skillful in avoiding infection. (3) Many lives have been saved by improved methods of treatment, especially by the use of sulfa drugs and penicillin.

Table 2 also presents mortality rates from septic and nonseptic abortion for the white and colored population of the United States. Three facts are strikingly evident: (1) Mortality from abortion has been much higher among colored than among white women. (2) It has declined much faster among the whites than among the colored.

| West | 34 | 83 | 11 | * |
| United States | 33 | 90 | 10 | 28 |

* Less than 15 cases

(3) These statements are true for septic and nonseptic abortions.

The available evidence, meager as it is, indicates that in the United States the incidence of induced abortion is lower among colored than among white women. It seems, therefore, that the shockingly high mortality rates recorded for the colored population are due to the poor caliber of the abortionists and to the general inadequacy of the medical services available to nonwhites.

In addition to the color differential, marked regional differences are found within the United States (Table 3). Among white women, mortality from septic abortion is lowest in New England, the Middle Atlantic States, and on the Pacific Coast. It is highest in the Mountain Division and generally high throughout the South. The pattern is similar for nonseptic abortion. As far as the colored population is concerned, mortality rates from septic abor-

tion show comparatively little variation with the exception of a very high figure observed in the Northeast. Mortality from nonseptic abortion is highest in the South.

Through the courtesy of Dr. Halbert L. Dunn the National Office of Vital Statistics has furnished the author with a tabulation of deaths from abortion by color, region, and size of community for 1945 (Table 4). This tabulation is based not on place of death but on usual residence. Total numbers of cases are small and our estimate of population is less reliable than one would like to make it. With these reservations the following observations are in order: Mortality from septic abortion appears to be on the same level in larger and smaller cities and only slightly lower in rural areas. This finding is at vari-

ance from the widely held belief that death from septic abortion is by far most common in the metropolis. Mortality rates from nonseptic abortion tend to be highest in the country and lowest in the large cities. Additional data covering several years will be necessary to test the validity of these observations.

Turning now to the international scene we find in Switzerland⁹ the longest series of mortality rates from abortion. What makes this series particularly valuable is that a confidential death certificate has been used in Switzerland since the turn of the century. Unfortunately the series is limited to septic abortion. Mortality from this cause doubled between 1901-1905 and 1916-1920, rising from 38 to 81 per million women of reproductive age.

Freudenberg² and Nevermann⁵ have studied the course of mortality from abortion in Berlin and Hamburg. Both authors report steeply increasing numbers of deaths between the early part of the 20th century and the years immediately after World War I. Their material, however, included deaths of nonresident women and therefore presents an exaggerated picture. The number of nonresident cases can only be estimated. If they are excluded, the combined mortality from septic and nonseptic abortion in Berlin and Hamburg

probably ran to about 400 per million women of reproductive age in 1920.

Table 5 presents the available data on mortality from abortion for the United States, England,¹ Prussia,⁸ and Germany³ for the period from 1920 to 1945. The mortality rates from septic abortion are comparable throughout the table but whereas each series of mortality rates from nonseptic abortion is uniform their mutual comparability is limited by the different rules for determining primary cause of death used in each country. As Prussia included two-thirds of the population of Germany during the inter-war period it has been considered permissible to show the rates in the same column.

The following generalizations suggest themselves: (1) Mortality from septic and nonseptic abortion has declined in each country. (2) Mortality from septic abortion has been on the same general level in Germany and the United

States but seems to have fallen faster in the former country between 1933 and 1938. These were, of course, the years of the all-out population drive in Germany and strong efforts were made to suppress illegal abortion. (3) England had a much lower mortality rate from septic abortion in the 'thirties than either Germany or the United States, but decline has been slower and for the last few years her rates have been almost identical with those observed in America.

SUMMARY

The general picture of mortality from abortion in all countries studied is one of steady decline over the past 30 years. In the United States the rate per million women of reproductive age has decreased by about four-fifths from 1927 to 1945. It has decreased more rapidly for white than for colored women and is now nearly 4 times as high among the latter. In addition, marked regional differentials prevail. The actual level of mortality from abortion cannot be accurately determined but the downward trend is certainly real.

MANY workers in the field of public health may be wondering why a health officer should be concerned with accident prevention. They may feel that most accidents are due to motor vehicles and that they therefore should be the concern of a state highway department. This is not true. In 1947, on the basis of preliminary estimates, there were only 32,000 motor vehicle deaths out of a total of 100,000 accidental deaths. During the same time there were 33,500 deaths due to home accidents.¹ Anything that affects the health and life of the people and is preventable is a concern of the health officer. The free access of health department personnel to homes makes them especially effective in combating home accidents.

Some may ask, "Why bother with occasional scattered non-communicable injuries that result from accidents? Certainly there is no epidemic of accidents at present."

That is a debatable question. We may well be in the midst of an epidemic of accidents at the present time as related to 100, 500, or 1,000 years ago. As our vital statistics on accidents do not go back more than 40 or 50 years,

we cannot conclusively prove this. It seems obvious, however, that as we harness the forces of nature and convert them by technical advances into locomotives, automobiles, airplanes, explosives, skyscrapers, tunnels, submarines, etc., we are introducing more and more accident possibilities. For example, in the first 40 years of this century, deaths due to automobile accidents alone rose from zero to 26.2 per 100,000.² In the same way, deaths from airplane traffic have mounted, and so with each of the newer mechanical inventions. It is true that before the automobile, there were deaths from runaway horses and from collisions between carriages. Before that, primitive man occasionally slipped on the mountainside but accidents must have been less frequent and less hazardous than now. A leak in a gasoline tank on an airplane is fraught with much more danger than a leak in the feed bag of a horse. If a bow and arrow were accidentally discharged 1,000 years ago, much less damage was done than by accidental discharge of an ammunition dump or a shipload of nitrate today.

In other words, it is quite probable that in the natural history of accidents, the current prevalence does represent an epidemic. Just what constitutes an epidemic? Webster says an epidemic is "a rapidly spreading or widely prevalent attack of disease." Accidents are certainly widely prevalent. Exactly what is a disease? Is it only a bacterial

* Modified from an address presented at the annual meeting of the Association of State and Territorial Directors of Local Health Services at Lake Ozark, Mo., April 22, 1948.

Note: I wish to acknowledge gratefully the influence of some of the concepts of the universal effectiveness of the epidemiological approach as described in unpublished lectures of Dr. John E. Gordon.

or virus illness, or are heart disease, cancer, pellagra, diabetes, etc., also diseases? Of course, they are. Let us go back to Webster's unabridged *Dictionary* for another definition. A disease is "a condition in which bodily health is seriously attacked, deranged, or impaired." Accidents certainly attack, impair, and derange bodily health.

However, even if we do not have a relative epidemic of accidents at present, that does not mean that epidemiological methods do not apply or that they cannot be effective. Epidemiology is concerned with the entire natural history of a disease, and attempts to institute preventive measures during endemic, as well as epidemic times. You are all familiar with the epidemiological approach to such "orthodox" diseases as smallpox, plague, typhus fever, etc. More recently we are all beginning to see that this same approach can be effective for more "unorthodox" diseases such as heart disease, silicosis, cancer, congenital cataract following German measles, etc. Exactly the same approach can also be effective for accidents. What is more, it may be even more necessary for accidents, because we do not have the same latent incubation period nor as many drugs to cushion the ill effects. For example, if we happen to contact the agent producing syphilis we have 24 hours to use soap, calomel ointment, or other things to stop the damage. Even if we cannot stop the initial damage, we can fall back on penicillin. Our aim as an epidemiologist, however, is still primarily to stop the agent from contacting the host. If, on the other hand, in an accident we contact the agent, which could be a carelessly placed roller skate, which causes a broken back by precipitating a fall down stairs, our back is broken in two or three seconds. We do not have 24 hours to prevent it from getting injured. Once the back is broken, or the skull fractured, penicillin is not as effective in healing the broken

bones as it is in healing the ravages of syphilis.

You can therefore see that the epidemiological principle of interrupting the agent in transit to the host, i.e., seeing that the roller skate did not get slipped on is, if anything, more urgent than seeing that the treponema of syphilis does not contact the host.

Another point favoring the epidemiological approach to accidental injuries is that in accidents it is easier to identify the agent and thus guard the host from contact with it. For instance, in the above example, it is vastly easier to see the roller skate at the top of the stairs than it is to see a microscopic spirochete lurking deep in the depths of a dark vagina.

How can we apply other basic epidemiological principles to this problem? These basic principles and methods of achieving them are given slightly different emphasis and description by different authorities but fundamentally they are the same. The grouping used here is based largely on recent unpublished lectures by Dr. John E. Gordon. The 4 chief principles are:

1. Determination of existing status and behavior of the disorder in the community or universe being investigated
2. Determination of causes related to the status of the specific disorder
3. Development of specific measures for adequate control
4. Evaluation of results that come from recommended procedures

Those are the principles. What are the methods of achieving these principles?

First, to determine the exact status and behavior of a disorder, we must collect the customary epidemiological data. What is its frequency of occurrence? How many per 1,000 or 100,000? What are the most common types of home accidents? How are they distributed as to age? What is the sex distribution? What type of home are they most frequent in?

This information may all be helpful.

in determining the cause and there is no fundamental difference between this information and the type of information obtained in combating an epidemic of typhoid fever, food poisoning, yellow fever, etc.

Second, the determination of causes related to the status of a specific disorder. Here we make inferences from the epidemiological data gathered, in order to determine the cause. For example, if many accidents occur in bathtubs without handles for support or without rubber bath mats, that may be one of the main causes of this type of accident. If, however, these same unguarded bathtubs are safe for young adults but not for elderly people, then another and perhaps more important contributory cause may be inferred, i.e., the infirmity and physical instability of old age.

If electrocution deaths occur only where faulty or unlicensed wiring is present that may be the cause of this type of accident.

Thus, each of the more prevalent types of accidents may, by orderly inductive reasoning from an analysis of the surrounding factors, be attributed to certain causes. Once these causes have been established we may then proceed to the next step in the control of epidemics.

That is the third principle—the development of specific measures for adequate control of the disorder. To help us apply this to accidents let us carry our analogy further. In the more orthodox bacterial epidemics we are all familiar with the measures which help in control. They are primarily three-fold: destroy the reservoir of infection; interrupt the agent in transit to the host; or, increase the resistance of the host.

Let us examine each of these more closely. First, the methods of destroying the reservoir of infection. We know that in the battle of agent versus host,

if the reservoir of the agent is destroyed, it can no longer harm the host. If the agent, for example, is an old forgotten bottle of medicine that was drunk in lethal amounts by a youngster, it should have been discarded. If the agent is a red-hot, old-fashioned pot-bellied type of heating stove, perhaps it can be discarded and replaced by another less dangerous form of heating. Agents may be deficiencies as well as positive items; as in the case of pellagra. If the agent is the lack of lights or railings on stairways, the lack of hand supports on bathtubs, the lack of safe play areas, etc., these conditions should all be remedied.

Second, the methods of interrupting the agent in transit to the host. There is a definite similarity between measures used for stopping the typhoid carrier from transmitting the bacilli from his hands to your food, and stopping fire from an open fireplace, by a firmly fixed screen, from reaching a toddler creeping on the floor. There are many ways of keeping the agent away from the host. For example, a gate at the top of a stairway; a strong screen placed in low windows when open; keeping poisons, matches, knives, and other agents frequently causing accidents away from the susceptible host by placing them safely out of reach; etc.

Third, methods for increasing the resistance of the host. The "herd immunity" can be increased by safety education and increased consciousness of accident hazards. Accident prone individuals may perhaps be made less accident prone by medical or psychiatric treatment. If necessary, a change to a less hazardous occupation could be made.

The fourth and final basic principle in epidemiology is the evaluation of results that come from recommended procedures. Methods for this would be no different from methods used in the more orthodox diseases. Incidence and

prevalence reports would be compared with those existing in other communities as well as with those in one's own community before the control measures were instituted. The supplementary essential of reporting to the public on the effectiveness of control measures must not be overlooked. This should be done in simple, non-technical terms that strike as near home as possible. The human interest elements should be emphasized.

What sort of specific things should a local health department do to combat accidents? They involve the various details that follow in a logical way from the approach outlined above. Many of the specific duties appropriate for each staff member have been described in various publications during the past few years³⁻⁸ and therefore need not be repeated here.

What can you as directors of local health services do in accident prevention? First, you can encourage and advise local health departments to initiate or extend their efforts especially in home safety, in an organized epidemiological fashion. Second, at a state level you can encourage initiation and expansion of similar activities. After all, most states have separate departments for venereal disease, nutrition, communicable diseases, etc. In 1944 more people died in the United States as a result of accidents than as a result of the common communicable diseases, venereal disease, nutritional disease, acute rheumatic fever, and diseases of pregnancy, puerperium, and childbirth, all combined.⁹

SUMMARY

Accidents have been shown to be a widely prevalent scourge on the health of the people; they are to a very large measure preventable; they are susceptible to attack by the epidemiological approach; and especially in the case of home accidents they are in the province of the health department. It is the health departments that have free access to the home; that have a responsibility for factors affecting the health of the people; and especially, it is the health departments that have the know-how of the epidemiological method.

THE PROBLEM OF REHABILITATION

ONE of the most significant advances made in medicine during the post-war period has been the increased recognition given to medical rehabilitation as an integral part of medical care. Satisfactory job placement is the capstone of any successful vocational rehabilitation program; but medical rehabilitation, starting at the earliest possible moment following acute illness or injury, is its foundation. All subsequent rehabilitation processes must be built upon that residual physical disability which medical treatment cannot eliminate.

The fact that vocational rehabilitation and medical rehabilitation are interdependent and inseparable, has been demonstrated by the successful programs in military and veterans' hospitals, and has been recognized in the civilian field by the enactment of the Barden-LaFollette Amendment, which expanded the Federal-State Vocational Rehabilitation programs to include physical restoration and medical care.

Although the focus of attention has been centered on the disabled veteran, the extent of disability among our civilian population is far greater. There were 19,000 amputations among military personnel during World War II, but over 120,000 major amputations during this same period among our civilian population. Approximately 1,500 men were blinded while in military service during World War II, but 60,000 civilians lost their sight during the same period. Some 265,000 men were permanently disabled as a result of combat injuries during the war, but 1,250,000 civilians were permanently disabled by disease and accidents during the corresponding four years.

The National Health Survey conducted in 1935 led to the estimate that 23,000,000 persons in the United States are handicapped to some extent by disease, accident, maladjustment, or war. Later reports, based on smaller but probably more scientifically chosen samplings, have indicated that disability resulting from chronic disease is even more prevalent. In a recent survey in New Haven, Conn., conducted by the Yale University Department of Public Health, it was found that 121 persons out of each 1,000 in the population surveyed suffered from chronic illness, and that one-third of this number were totally disabled. Today, as medical science moves forward in the prevention and cure

of infectious disease, chronic illness with its resulting physical, emotional, social, and vocational disability, is becoming one of the nation's primary health and welfare problems.

That rehabilitation pays economic as well as social dividends, has been amply demonstrated by the military services, the Veterans Administration, and some model civilian programs. During 1944, 43,997 persons underwent rehabilitation under the joint Federal-State Vocational Rehabilitation programs. Of this group, 22 per cent had never held jobs, and 90 per cent were not employed at the time they started rehabilitation. Their average annual wage after rehabilitation was \$1,768, as compared with \$148 before. Many had been on public assistance at a cost of \$300 to \$500 annually, but the cost of their rehabilitation was but \$293 per case, a single rather than an annually recurring expenditure.

That rehabilitation is possible even with many of the aged chronically ill, has been shown by a study of 130 chronic neurological patients in the Veterans Administration Hospital at Minneapolis, Minn. All but two of this group were World War I veterans, and many had not been out of bed for 10 years. After 9 months of medical rehabilitation, 25 had left the hospital and were employed, 40 others had been discharged to their homes capable of light work, and of those remaining, 30 were ambulatory and undergoing advanced rehabilitation, and 25 were capable of some self-care. All but 10 of the group had shown significant permanent improvement. With a 5 year life expectancy for these patients, and a patient-day hospitalization cost of over \$12, rehabilitation of this one group alone has saved the government over \$1,250,000.

In the civilian field, rehabilitation, in varying degrees, has been available in some tuberculosis, mental, and other specialized hospitals, but little provision has been made for rehabilitation and dynamic therapeutics for the 14,000,000 persons who are patients in general hospitals each year.

The first comprehensive, total, medical rehabilitation program in any community hospital in this country was started at Bellevue Hospital in New York a year ago. Operated under the professional direction of the Department of Rehabilitation and Physical Medicine of the New York University College of Medicine, the service has bed facilities for 80 patients, and offers a program of physical medicine, physical therapy, occupational therapy, corrective physical rehabilitation, social service, corrective speech, psychological service, vocational guidance, education and planned recreation. It provides service to the other departments of the hospital in much the same manner as the x-ray and laboratory, and treats both inpatients and outpatients on reference from other services. This rehabilitation service in Bellevue Hospital, which will be enlarged to 600 beds when presently planned construction is completed, is the first step in a plan by the Department of Hospitals of the City of New York to provide all patients in municipal hospitals of the city with medical rehabilitation services.

The extent to which rehabilitation has entered into future planning in New York City in both public and private hospitals, is shown by a report of the Hospital Council of Greater New York, in which it was suggested that 25 per cent of the bed capacity of the city's general hospitals should be allocated for convalescence and rehabilitation. This would mean one such bed for each 1,000 of the city's population.

The Health Officer is an indispensable member of the rehabilitation team. Probably his most important role is in public and professional education as to the therapeutic possibilities offered by rehabilitation. He has a primary

part to play in case finding and in correlating all community and health resources into a unified program.

During the past several decades, the field of preventive medicine and the practice of medicine, surgery, and public health have made tremendous advances. Ironically, those advances, by delaying death, have created the need for a new "third phase of medical care"—rehabilitation—to meet the responsibility which Dr. Edward L. Bortz, President of the American Medical Association so aptly summarized when he said, "The society which fosters research to save human life, cannot escape the responsibility of the life thus extended. It is for science not only to add years to life, but, more important, to add life to the years."

THE FIRST WORLD HEALTH ASSEMBLY

AN important milestone in the history of public health was the first World Health Assembly of the World Health Organization, which met at Geneva on June 24, 1948. It will be recalled that the remarkably broad and inspiring Constitution of the WHO was drawn up at the New York International Health Conference in the summer of 1946. The World Health Organization came into official existence on April 7, 1948, when the necessary 26 nations had notified the Secretary-General of ratification of this constitution. At the Geneva meeting in June, delegates or observers from more than 70 participating countries were in attendance.

The United States (represented by Thomas Parran, Martha M. Eliot, and James R. Miller as official delegates, with a large staff of alternates and advisers) found itself in a somewhat difficult situation. The Rules Committee of the House of Representatives, in its long delayed reporting of the bill authorizing our membership, tacked on two ill-mannered and objectionable amendments. The first of these reserved the right of the United States to withdraw at any time on a one year notice; the second, limited the financial contribution of the United States, with unfortunate results which will be noted in a succeeding paragraph.

The reservation with respect to possible withdrawal of membership raised serious legal problems. No other nation had made any such stipulation. The United States was, however, at once granted full rights as a member, subject to final decision of the Assembly; and when the matter of the validity of the qualified ratification of the Constitution by the United States came up in the 10th plenary session, Sir Wilson Jameson of the United Kingdom opened with a brief statement accepting the validity of our ratification. He was followed by Sir Dhiren Mitra, a legal adviser to the High Commissioner for India in the United Kingdom, who also accepted the validity of the ratification from a legal point of view. At this point, Dr. Parran made a brief speech pointing out the great interest of the United States in the World Health Organization, quoting from the President's release at the time he signed the Act ratifying the WHO Constitution. The President of the Assembly then recognized the Chief Delegate from the USSR who referred to the legal problem raised, but after some discussion moved that the United States be accepted as a full member of the World Health Organization. The adhesion of the United States was thereupon accepted by general acclamation. From this time on there was no further question as to our full membership and desire to coöperate completely; and this unfortunate episode may be considered as closed.

EDITORIALS

Vol. 38

The main business of the Assembly was the consideration of a report by the Interim Commission appointed at New York, under the very able leadership of Dr. Andrija Stampar of Yugoslavia; and Dr. Stampar was elected President of the World Health Assembly to serve until the next meeting of that body. He presided with the forcefulness and fairness which we all associate with his distinguished personality.

The nations elected to the Executive Board for actual administration of the WHO program were Australia, Brazil, Byelorussian Soviet Socialist Republic, Ceylon, China, Egypt, France, India, Iran, Mexico, Netherlands, Norway, Poland, Union of South Africa, Union of Soviet Socialist Republics, United Kingdom, United States of America, and Yugoslavia.¹ The Executive Board elected Sir Aly Tewfik Shousha Pasha of Egypt as its Chairman. Dr. Brock Chisholm of Canada (who has served as director of the Interim Commission) was elected Director-General of the World Health Organization. No better choice could possibly have been made. Permanent central headquarters were established at Geneva; and six regional offices are contemplated, in the Eastern Mediterranean and Western Pacific regions, Southeast Asia, Africa and Europe (the last-named to render temporary service in war-ravaged countries). It is, of course, hoped to complete negotiations for integrating the Pan American Sanitary Bureau and the Pan-Arab Sanitary Bureau at Alexandria within the framework of the WHO. In this emphasis on decentralization, the new Organization is far superior to that of the League of Nations.

In general, the spirit of the Assembly reached a high plane of generous and whole-hearted coöperation; and we, as public health workers, may feel proud of the harmony and the enthusiasm which prevail in this area of international comradeship. Dr. Martha M. Eliot reports "at the First Assembly the program of action was finally adopted without dissent. The committee that formulated it was a 'committee of the whole' on which every nation was represented. When different views were expressed from the floor, 'working parties' were appointed. Usually these working parties were made up of those countries whose views were at variance, together with a few neutrals. Solutions to problems were as a rule promptly found, though, in a few instances, negotiations took both time and patience. In no case, when the matter under discussion related to health service or technical policy, was there an impasse. Only occasionally was a vote necessary in any 'committee of the whole' or in the plenary sessions, and, in such instances, the will of the majority was accepted without question."²

The program adopted by the Assembly gave top priority to six major problems—malaria, maternal and child health, the control of tuberculosis, and of the venereal diseases, environmental sanitation, and nutrition. In these fields, substantial budget allotments were made for staff and travel costs which would make possible, not only investigation of basic problems but also direct assistance to governments, at their request, in the form of expert advice, demonstration teams, and training programs. Public health administration (including public health nursing), parasitic diseases, virus diseases, and mental health were given a second grade of priority, each to be represented by at least one staff member and a small committee of experts.

All in all, the First World Health Assembly was an inspiring success. The

¹ Only three nations in the Western Hemisphere are included because only 8 out of 22 nations in this hemisphere had ratified the Constitution at the time of the Assembly.

² *Survey Graphic*, Sept., 1948.

only limitation on its future usefulness is a financial one—a problem created by the second reservation in the Act of Congress providing for our ratification. This Act fixed a limit of \$1,920,000 on the annual contribution of the United States—again a unique reservation, since no other nation had protected its pocket-book by similar action. The WHO voted to accept as its scale of proportionate financial support by various nations the scale established by the United Nations which calls for a contribution of about 38 per cent of the total world budget by the United States. This has been agreed upon as a reasonable arrangement for the year 1949, but it was decided to review the scale of contributions before the budget for the year 1950 is adopted. While prosperous peoples furnish more dollars under such a plan, it is no more onerous for the United States to provide \$38 than for many peoples to provide \$1. The total budget will most certainly, therefore, be kept by the Assembly within reasonable bounds, since all are equally interested in economy.

The establishment of \$1,920,000 by the United States automatically freezes the total budget of the WHO at \$5,000,000. This is quite reasonable for the moment, providing all the money which could be spent wisely for the first year. It is obviously inadequate for future developments. It is no more than the health budget of a single large city. It cannot suffice to finance a fully developed central organization, half a dozen regional offices with research and working parties, and a training program. We do not believe that any citizen of the United States will hesitate to contribute one three-cent postage stamp a year to the cause of world health, which would more than double the limit set by Congress. The establishment, in advance, of a ceiling for our contribution should be eliminated by future congressional action.

THE HEALTH RECORD OF THE EIGHTIETH CONGRESS

THE Congress which has recently expired (unless another special session is called this fall) has been described as the "worst" and "best" Congress in our national history. Both are perhaps exaggerations. In the health field, the average accomplishment is about 35 per cent of an ideal record.

We listed in the *Journal* for last January, eleven major bills (or groups of parallel bills) bearing on health problems which had been introduced. Of these, three have been passed in satisfactory form; and represent important advances in public health. They are the National Heart Act (Public Law 655), the Dental Research Act (Public Law 755), and the Stream Pollution Bill (Public Law 845). We urge public health workers to obtain copies of these three laws and to consider their possibilities.

A fourth measure, involving adhesion of the United States to the World Health Organization (Public Law 643) was passed with serious, but not fatal, amendments which have been discussed in a preceding editorial.

The other seven measures, dealing with cancer research, maternal and school health, training of public health personnel, the creation of a Federal Department of Health, Education and Security, and with the problems of housing and of medical care, were all smothered in committee. Almost all of them would have readily passed if they had come to the floor. It is important to recognize that the major procedure by which interested minorities strangle useful social legislation is through failure to hold hearings or failure to report a bill or refusal of

the rule necessary for consideration of a bill. Through the manipulation of committee machinery, a handful of influential politicians can block the realization of legislation which is desired by the majority of Congress, as has been the case in both the 79th and the 80th Congresses, with regard to housing. Our membership in the World Health Organization was salvaged, only at the last moment by great pressure upon the Rules Committee of the House of Representatives. This is a point important to bear in mind in working for sound health legislation in future sessions.

NINTH INTERNATIONAL CONGRESS ON INDUSTRIAL MEDICINE

IT is a decade since the last International Congress on Occupational Accidents and Disease took place—a decade in which industry, working conditions, and industrial health have undergone tremendous changes. It was therefore timely that the "Ninth International Congress on Industrial Medicine" should be called at London in September. This was originally described as an "International Congress on Occupational Accidents and Disease." The change in title significantly reflects a change in viewpoints which the past ten years have wrought in men's minds in this important segment of public health.

This year the program, instead of discussing accidents and disease as in former Congresses, had as its nucleus the factory and its environment, and then proceeded to the diseases of occupations, the organization of medical and nursing services, the training of medical and nursing personnel, legal aspects of industrial medicine, the social programs involved, and finally the integration of industrial medicine and community health services. It is significant but not surprising to note that a whole session was devoted to problems in the field of radiant energy.

The Congress should do much to clarify world thinking in its field. Its conclusions will be awaited with the keenest interest.

Clearing House on Public Health Salary Information

SALARIES IN LOCAL HEALTH

DEPARTMENTS

The State Personnel Administration Unit of the U. S. Public Health Service has completed its analysis of a sample study of salaries of professional workers in 236 local health departments in 37 states. This number of questionnaires was returned, of 366 sent to all full-time local health jurisdictions serving populations of from 50,000 to 250,000.

Salaries currently paid were reported for the following groups of workers, together with the number and the median salary of each:

Of the 39 health educators, 10 received \$3,600 or more and 5, less than \$2,400. These salaries include any cost of living bonuses or other temporary adjustments.

With some notable exceptions it is true that the higher salaries were found in the higher income and higher cost of living states. But the salaries as reported are eloquent testimony as to reasons for the high turnover; the overall shortage, and the defection from the ranks, of public health workers. If a fourth of the sanitary engineers and the professional laboratory personnel of

| | Number Reporting | | Range of Median Annual Salary |
|---------------------------------|------------------|-----------------------|-------------------------------------|
| | States | Health Departments | |
| Health officer | 34 | 191 | \$6,480-\$6,720 |
| Sanitary engineer | 25 | 90 | 3,840- 4,080 |
| Sanitarian | 36 | 212 | 2,640- 2,760 |
| Professional laboratory worker | 23 | 84 | 2,640- 2,880 |
| Supervising public health nurse | 36 | 159 | 3,000- 3,120 |
| Staff public health nurse | 37 | 224 | 2,400- 2,510 |
| Public health educator | 16 | 36 | 2,880- 3,120 |

Six health officers received \$9,600 or more annually, but 7 received less than \$4,800. No sanitary engineer received as much as \$6,000 and 15 received less than \$3,000.

Only three sanitarians received \$4,800 or more and 245, more than one-fourth of the total, received less than \$2,400. Two professional laboratory workers received \$6,000 or more but 48, or more than one-fourth, less than \$2,400.

Ten supervising nurses received \$4,200 or more but 10 received less than \$2,400, 17 staff nurses received \$3,600 or more but 655, more than one-third of the total, received less than \$2,400.

local health departments serving populations of from 50,000 to 250,000 are receiving less than a capable stenographer can demand it is little wonder that there are not enough recruits.

This study is a part of the plan of the A.P.H.A. Committee on Professional Education and the Association of State and Territorial Health Officers to make available to administrative and appropriating bodies current information on public health salaries. The report of the initial study, based on salaries in state health departments, was made in the *Journal* of May, 1948, p. 715. A second analysis of salaries in

state health departments is now in process.

General guidance of the studies is provided by a Subcommittee on Salaries, whose chairman is William R. Willard, M.D., Assistant Professor of Public Health, Yale School of Public Health. The analysis and tabulation of returns are done by the Administrative Analysis Unit of the U. S. Public Health Service

under the direction of its chief, Don F. Simpson.

This study, published in limited quantity, is not available for general distribution but administrators or personnel officers with a need for it may secure it by request from the Committee on Professional Education, A.P.H.A., 1790 Broadway, New York 19, N. Y.

MASSACHUSETTS STANDARDIZES SALARIES

In 1947 Governor Bradford of Massachusetts appointed an advisory salary standardization board. The report of this board was published early in 1948 and is now available in printed form. Further, its recommendations were adopted by the General Court of Massachusetts.

Among the first results of the board's study and report is a standardization of the salary structure. Whereas previously there were more than 300 grades of positions in the state service, these have been consolidated into 74 grades for all except labor service, each with a salary scale, schedule of annual increments, and a maximum that takes effect beginning with the twelfth year of service. Minimum salaries for the 74 grades range from \$1,200 to \$9,900, maximum from \$1,800 to \$11,400. It might be added that only two current titles are in the lowest salary grade—union messenger and guide to the blind.

The immediate urgency of the cost of living was recognized by the board and the General Court which carried out its recommendations in a cost of living payment of \$100 to every state employee on April 1, 1948. Permanent salary increases became effective July 1, 1948, for every state employee not on statutory salary. In no case was the increase less than the lowest annual increment of \$120. The cost of the temporary cost of living adjustment

was \$2,200,000, the annual cost of the permanent salary increases \$3,800,000, the maximum amount, the board said, "which it is possible to provide at the present time without calling for new or additional taxes."

Below are shown public health titles in the various salary grades and salary scales and increments for each of these grades:

14. Dental Hygienist, Junior Sanitary Engineer Aid
22. Assistant Biometrician, Inspector of Eggs, Public Health Nutrition Worker, Tuberculosis Field Nurse
24. Inspector Mastitis Control, Milk Records, Dairy Products; Milk Control Inspector, Investigator; Junior Bacteriologist, Chemist, Senior Sanitary Engineering Aid
28. Food Inspector
29. Health District Sanitary Officer, Milk Control Enforcement Officer; Public Health Dental Hygiene, Public Health Nursing, and Public Health Social Work Supervisor; Supervising Tuberculosis Field Nurse; Poultry Inspector
30. Public Health Nutrition Supervisor
31. Veterinary Food Inspector
32. Assistant Bacteriologist, Chemist; Junior Sanitary Engineer, Public Health Education Worker
35. Assistant Epidemiologist, Biometrician, Milk Control Hearings Officer, Supervising Health District Sanitary Officer, Supervising Instructor Public Health Nurse
37. Assistant Public Health Physician, Supervising Poultry and Egg Inspector
45. Assistant Industrial Sanitary Engineer; Assistant Sanitary Engineer; Senior Bacteriologist, Chemist

47. Associate Public Health Physician
48. Assistant Director Milk Control, Assistant District Health Officer, Chief Supervisor Public Health Nursing, Chief Veterinary Health Officer, Public Health Dental Supervisor, Teacher Training Coördinator Public Health Education
50. Epidemiologist
51. Associate Sanitary Biologist, Chief Coördinator Public Health Education, Chief of Laboratory, Senior Sanitary Engineer, Public Health Personnel Training Supervisor
52. Tuberculosis Clinic Physician
54. Chief Public Health Dental Supervisor, Public Health Physician
56. Director Food and Drug Supervision
58. Associate Sanitary Engineer
59. Assistant Director Biologic Laboratories, Cancer and other Chronic Diseases, Communicable Diseases, Local Health Administration, Maternal and Child Health, Public Health Administration, Venereal Diseases; Director Dental Health, Public Medical Care, District Health Officer; Supervisor, Crippled Children's, Tuberculosis Clinics; Supervisor Hospital Inspection
61. Sanitary Engineer
63. Director Biologic Laboratories, Cancer and other Chronic Diseases, Communicable Diseases, Local Health Administration, Maternal and Child Health, Venereal Diseases
67. Deputy Commissioner and Director Sanatoria and Tuberculosis

Rates

| Salary Grade | Annual Increment | Minimum | Second Year | Third Year | 4th through 7th Year | 8th through 11th Year | Maximum from 12th Year |
|--------------|------------------|---------|-------------|------------|----------------------|-----------------------|------------------------|
| 14 | \$120 | \$1,980 | \$2,100 | \$2,220 | \$2,340 | \$2,460 | \$2,580 |
| 22 | 120 | 2,460 | 2,580 | 2,700 | 2,820 | 2,940 | 3,060 |
| 24 | 120 | 2,580 | 2,700 | 2,820 | 2,940 | 3,060 | 3,180 |
| 28 | 120 | 2,820 | 2,940 | 3,060 | 3,180 | 3,300 | 3,420 |
| 29 | 120 | 2,880 | 3,000 | 3,120 | 3,240 | 3,360 | 3,480 |
| 30 | 120 | 2,940 | 3,060 | 3,180 | 3,300 | 3,420 | 3,540 |
| 31 | 180 | 3,000 | 3,180 | 3,360 | 3,540 | 3,720 | 3,900 |
| 32 | 180 | 3,120 | 3,300 | 3,480 | 3,660 | 3,840 | 4,020 |
| 35 | 180 | 3,240 | 3,420 | 3,600 | 3,780 | 3,960 | 4,140 |
| 37 | 180 | 3,360 | 3,540 | 3,720 | 3,900 | 4,080 | 4,260 |
| 45 | 180 | 3,840 | 4,020 | 4,200 | 4,380 | 4,560 | 4,740 |
| 46 | 180 | 3,900 | 4,080 | 4,260 | 4,440 | 4,620 | 4,800 |
| 47 | 180 | 3,960 | 4,140 | 4,320 | 4,500 | 4,680 | 4,860 |
| 48 | 180 | 4,020 | 4,200 | 4,380 | 4,560 | 4,740 | 4,920 |
| 50 | 240 | 4,200 | 4,440 | 4,680 | 4,920 | 5,160 | 5,400 |
| 51 | 240 | 4,320 | 4,560 | 4,800 | 5,040 | 5,280 | 5,520 |
| 52 | 240 | 4,440 | 4,680 | 4,920 | 5,160 | 5,400 | 5,640 |
| 54 | 240 | 4,680 | 4,920 | 5,160 | 5,400 | 5,640 | 5,880 |
| 56 | 240 | 4,920 | 5,160 | 5,400 | 5,640 | 5,880 | 6,120 |
| 58 | 300 | 5,100 | 5,400 | 5,700 | 6,000 | 6,300 | 6,600 |
| 59 | 300 | 5,400 | 5,700 | 6,000 | 6,300 | 6,600 | 6,900 |
| 61 | 300 | 6,000 | 6,300 | 6,600 | 6,900 | 7,200 | 7,500 |
| 63 | 300 | 6,600 | 6,900 | 7,200 | 7,500 | 7,800 | 8,100 |
| 67 | 300 | 7,800 | 8,100 | 8,400 | 8,700 | 9,000 | 9,300 |

PUBLIC HEALTH WORKERS AND REHABILITATION

"Since Pearl Harbor, five American civilians have become disabled for every American soldier. At least 1,500,000 men and women in the civilian population have some disability which constitutes a barrier to their fullest mental, physical, social, vocational, and economic usefulness. And their number increases by 200,000 a year, through accidents and illness or from congenital causes." This paragraph is part of the foreword of a brief, concise and clear booklet on Vocational Rehabilitation which should be useful to all health workers (*Vocational Rehabilitation for Civilians*, Office of Vocational Rehabilitation, Federal Security Agency, Washington 25, D. C. 21 pp.).

Workers in health agencies become increasingly aware of the importance of well coördinated rehabilitation activities on the community level and of the part they must play in such planning. The booklet mentioned above lists as eight steps in vocational rehabilitation: case finding, medical and vocational diagnosis, guidance and counseling, physical restoration, training for a job; auxiliary services, placement, and follow-up. Case finding—the first step—depends on various sources. According to a statistical analysis on the sources of almost 150,000 referrals to state rehabilitation agencies, health agencies ranked as the largest single source (13.6 per cent), with insurance agencies, employment services, and selective service as close seconds.

Vocational rehabilitation activities are directed toward restoring the handicapped to employment at the highest possible level. This includes the spastic, the blind, the deaf, cardiac patients,

amputees, the paraplegic, the mentally deficient, and many others, at home or in institutions. It includes those who have never worked and others who have to relearn their usefulness. "Employ the Physically Handicapped Week" (October 3-9) reminds the general public that this is a community problem. Employment of handicapped workers does not represent charity since it has been shown that the physically or mentally handicapped have been able to perform efficiently 3,500 different jobs and, in general, the handicapped have a better volume of production, higher attendance rates, better safety records and stability than non-handicapped workers.

HOW IT'S DONE IN OREGON

The July 14 weekly *Oregon State Board of Health Bulletin* tells how the 25th county and 19th full-time county or multi-county health unit was organized. Securing such a unit has long been an objective of the Malheur County Tuberculosis and Health Association, it reports. The County Medical Society not only approved but appointed a county health council with a prime objective of obtaining a health department. The Oregon Tuberculosis and Health Association financed a full-time staff member for 4 months to acquaint citizens with the need, purposes, and functions of a county health department. The part-time county health officer and the county nurse approved.

Result: the citizens voted a bond issue to support a health department, the county court approved a budget of \$24,000 for the first year, sufficient to employ a full-time medical director, two nurses, a sanitarian, and a clerk.

Malheur County, with an area of nearly 4,000 square miles, in 1940 had a population of about 20,000. *Local Health Units for the Nation*, the report of the Subcommittee on Local Health Units, recommended a 3 county unit for this area including Grant and Harney Counties. This would make a unit of more than 10,000 square miles in area and less than 35,000 in population (1940) and illustrates graphically some of the problems of sparsely settled areas.

THE VERSATILE GOOBER

While Fairfield Osborn and William Vogt have been sounding their alarms about world-wide destruction of soil and dwindling food supplies, the British Government has developed a unique food program in Tanganyika, East Africa. The story is available in a very attractive pamphlet—*Not Just Peanuts*—available from British Information Services, 30 Rockefeller Plaza, New York 20. It is the story of a series of vast mechanized peanut farms planned for East Africa, to harvest three-quarters of a million tons of peanuts yearly and thus add to the world's edible fat and oil supply, to say nothing of raising the living standards of East Africa. This is one more evidence of the high level planning Britain initiated during the recent war in the effort to give all its citizens adequate nutrition. When the peanut project is in full swing every person in Britain will get 35 per cent more fat than the present ration of 8 ounces weekly.

ORIENTING DENTAL STUDENTS IN PUBLIC HEALTH

In order to aid the dental student "to appreciate the scientific and technical problems with respect to public health theory and practice and their various relationships to dental care," Alfred J. Asgis, D.D.S., Assistant Professor of Oral Surgery and Lecturer in

Public Health, New York University College of Dentistry, has prepared *Public Health and Dental Care*. He describes it as a "work book for the classroom." It is a tool to introduce the dental student to the background of the public health movement, essentials of public health dentistry, dental economics, training, and dental health planning.

Suggested topics and questions for exploration and discussion and a list of references together with blank pages accompany each paper. This should be a valuable aid both to the teacher and to the student in giving direction to the latter's interest and activity. Its design should help to interest the oncoming dentist in the public health aspects of his profession. Available from New York University College of Dentistry, 209 E. 23rd Street, New York. \$2.00.

THE STORY OF BRITISH CHILDREN DURING THE WAR

"The Health of the School Child" is the title of the 1939-1945 war period report of the Chief Medical Officer of the British Ministry of Education, Sir Wilson Jameson.

It is the story of the evacuation of three-quarters of a million children, of the annual medical examination of more than a million and a quarter children of school age, of improved health and nutritional standards during the war, of lowered infant and child mortality rates.

The reasons are many but chiefly the "brilliantly successful food policy," described as "the first large-scale application of the science of nutrition to the population by rationing according to needs, by subsidies on staple foodstuffs, by home production and importation of suitable foods in suitable amounts, and by Lend-Lease arrangements. All these except Lend-Lease have been taken over into Britain's post-war national organization.

This is an exciting story of how, with an expenditure of \$20,000,000, Britain's children were involved in "a victory more lasting than the greatest military triumph . . . the victory has been consolidated and has created a base for further advance."

Available from the Sales Department, British Information Services, 30 Rockefeller Plaza, New York 20. 90 cents.

MORE STIRRINGS IN INDIANA

The first annual report of the Health Section of the Indianapolis Council of Social Agencies (901 Lemcke Building, Indianapolis 4) has recently been published—modest as becomes youth—signaling the first year of full-time staff service. Its story is one of solid accomplishment nevertheless. In May also it issued Volume 1 Number 1 of a one page monthly *Health Bulletin*. The report of the Priority Committee makes the development of a master health plan for metropolitan Indianapolis a major goal, the foundation of which is full-time public health department service in both city and county.

CONSOLIDATION HITS ITS STRIDE

Ohio Public Health, of the Ohio Tuberculosis and Health Association, is authority for the news that the Metropolitan Health Council of the City of Columbus and Franklin County has made one of its major projects a proposal to merge the five health departments in the county—Columbus and Franklin County with full-time health officers, the towns of Bexley, Grandview, and Upper Arlington—into a single county health department. This recommendation was first made a year ago by the Rural Health Committee of the Council after a survey of health services in the rural areas of the county.

The proposal for merging city and county health services has been endorsed by the Columbus Mayor, Academy of Medicine, Farm Bureau,

and Community Health Services, as well as the Metropolitan Health Council. The last has created a Health Department Integration Committee which includes membership, both official and voluntary, from the smaller communities in the county.

The population of Franklin County is about 400,000 of which all but one-fifth is in Columbus. Thus the four administrative units outside of Columbus have been serving a total population of less than 85,000. Per capita health expenditures have ranged from \$1 in Columbus to 15 cents in two of the suburbs.

INDUSTRY AND SANITATION

Another example of the growing recognition by industry of the money value of good sanitation is given in the *Sanitation News* bulletins published by the National Confectioners' Association, 1 N. LaSalle St., Chicago 2. Directed to the confectionery industry, these have been published at intervals of about 6 weeks and cover such topics as product control, storage, insect growth and control, rodents and their control, and personal hygiene.

EACH HAS ITS JOB IN DENTAL HEALTH

The Georgia Department of Public Health, Atlanta, has put out an attractive pamphlet in color, *For Dental Health*. In pictures and a few words it tells what the responsibility of the individual, the parent, teacher, dentist, public health worker, and citizen is in promoting dental health. Pictures of attractive youngsters are its passport to attention.

WORTH ACQUIRING

War in the Kitchen was prepared in the New York State Department of Mental Hygiene (State Office Building, Albany, N. Y.) by someone with a sense of humor and an appreciation of "brevity as the soul of wit." Calling

the kitchen a fortress against a deadly enemy—germs—in brief compass and bright language it tells food service employees of New York State mental institutions how not to contaminate food, how to wash it, what foods need thorough cooking, how to wash dishes, etc. The booklet does not say so, but perhaps a pretty please will get it for you. It ought to be a right smart help in food handlers' courses.

This Will Kill You will interest you because (1) it illustrates how words, pictures, color, and style generally can deliver their message so that he who runs may read, even without a Phi Beta Kappa key, (2) it gives the simple arguments in favor of a national health insurance plan. Illustrations by Eric Godal. Committee for the Nation's Health, 1790 Broadway, New York 19.

\$.03–\$.0375 per copy depending on size of order.

You Can Make a Good Radiograph: Here's How, prepared by Arnold J. Moen, X-Ray Engineer of the Washington State Department of Health's Tuberculosis Division, (1412 Smith Tower, Seattle 4) is subtitled, Practical Dark-room Procedure for X-Ray Film. Detailed instructions then follow on mixing solutions, temperature control, order of processing, exposure technique and all the necessary details for good results. The longest section is "The Reasons Why" and the payoff is, "These directions may sound like a lot of bother but experience has proved that when such a standard routine procedure has been established in the dark-room, the radiographic results are more consistent."

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted. All books reviewed in these columns may be purchased through the Book Service.

A History of Medicine — By Douglas Guthrie. Philadelphia: Lippincott, 1946. 448 pp. Price, \$6.00.

This is a reprinting of an excellent *British History of Medicine*, with an introduction by S. C. Harvey of Yale. It is unusually well written and can be read, as well as used, for reference. The information seems to be well documented, and the 72 plates are illuminating and most of them from sources not otherwise readily accessible. The discussions of prehistoric medicine and of the ancient medicine of India were of particular interest to the reviewer. The chapter on "The Rise of Specialism and of Preventive Medicine" brings together in convenient form much valuable information on the specialties. Preventive medicine, however, is dismissed in six pages in this chapter and the Appendix lists only five references on public health, of which but one is of primary importance.

This is perhaps the best brief work on general medical history which we have—perhaps the best which could be prepared. It will be of value for reference and may be read by the medical student to advantage. It is obviously impossible, however, in one volume of some 400 pages to develop the historical perspective and the philosophical interpretation necessary for an understanding of the real significance of the history of scientific advance in this field. One may fairly raise the question whether the history of medicine is not too vast and complex a subject to be profitably treated in one small volume. Castiglione takes over 1,000 pages for the job. The history

which Sigerist is preparing will—we understand—include at least eight volumes; and there is only one Sigerist. What we most need, perhaps in the future, is the thorough and thoughtful exploration of particular periods of medical history or of particular problems of medical science on a scale that permits a real critical illumination of the topic involved.

C.-E. A. WINSLOW

Physiologic Therapy in Respiratory Diseases—By Alvan L. Barach, M.D. (2nd ed.). Philadelphia: Lippincott, 1948. 408 pp. 74 illus. Price, \$9.00.

This book is a discussion of the use of oxygen, carbon dioxide, and helium in the treatment of pulmonary disorders. It should interest scientists particularly concerned with the processes of respiration, anesthetists who use nitrous oxide, and clinicians who specialize in pulmonary disease.

The first 3 chapters cover the historical development of these modalities. Then there are 20 chapters each devoted to the treatment of a chest condition (among them pneumonia, asthma, emphysema, bronchiectasis, pulmonary embolism and infarction, post-operative atelectasis, congestive heart failure, asphyxia, nitrous oxide anesthesia, pulmonary tuberculosis, hiccough, and coronary thrombosis), and finally 5 chapters concerning apparatus and methods.

Much of the discussion of anoxia is quite theoretical and some of it seems repetitious at times, but it is not obscure. Chemotherapeutic aerosols are considered in relation to pneumonia, asthma,

bronchiectasis, and sinusitis. The chapters on apparatus are well illustrated, they enumerate the advantages and disadvantages of oxygen tents and rooms, oxygen masks, and nasal and pharyngeal catheters, and give specific advice concerning their use in different conditions.

There is a general index and at the end of each chapter there is a rather long bibliography.

The book is obviously the work of a man who understands the physiology of respiration in health and disease and who has had wide experience in this field. The clinician will find it easy to use as a reference book and should find it valuable in this capacity.

ALAN L. HART

Principles of Occupational Therapy—*Edited by Helen S. Willard and Clare S. Spackman. Philadelphia: Lippincott, 1947. 416 pp. Price, \$4.50.*

Nineteen authors collaborated with the editors to produce this excellent collection of monographs to serve as a basic text for doctors, nurses, social workers, and occupational therapists.

The history, scope, and aims of occupational therapy and the organization of occupational therapy departments are discussed. The principles of occupational therapy are applied to a multitude of general problems within hospitals. Special chapters are devoted to mental disease, cerebral palsy, arthritis, tuberculosis, and visual handicaps. Finally, Army and Navy occupational therapy departments and the Veterans Administration rehabilitation program are described.

Until 1941 there were only 5 schools for professional occupational therapy training; today there are 26. The great increase in registrations, approximately from 100 to 1,750, has necessitated some control of the number of new schools.

This is not a textbook to describe, in detail, technical methods employed by occupational therapists. Its purpose is

to set forth the principles underlying occupational therapy—an objective which is admirably achieved. The general plan of presentation is: (1) description of chief characteristics of each disability; (2) discussion of general principles of occupational therapy in relation to these characteristics; and (3) enumeration of definite occupational therapy procedures which can be used in specific instances. This presentation of the basic principles and objectives should be valuable not only to occupational therapists but to other professional workers who can use it to understand and utilize occupational therapy and appreciate its value to the disabled.

As is frequently true when authors separately contribute to a symposium, duplication occurs. Examples are the several descriptions of desirable personal attributes for occupational therapists, and the many recommendations for workshops for the disabled. The reader who needs a composite of such opinions will find the index helpful but, frequently, not sufficiently extensive.

NORVIN C. KIEFER

Basic Facts of Health Education, Selected Articles from the Ministry of Health Bulletins published in the Pharmaceutical Journal, 1944-1947. *London: The Pharmaceutical Press, 1948. 193 pp. Price, 7 s. 6d.*

This publication is an interesting assortment of brief health articles by officers of the British Ministry of Health and allied health authorities published at quarterly intervals over a three year period in the *Pharmaceutical Journal*.

The articles were designed primarily to help pharmacists keep abreast with developments about which they might be consulted by the general public. The wide range of subject matter covered reflects well the important educational role of pharmacists with individuals in their "across the counter" contacts.

This volume will be of general inter-

est to members of the medical, pharmaceutical, nursing, and public health professions. A. HELEN MARTIKAINEN

Principles of Medical Statistics—
By A. Bradford Hill, D.Sc., Ph.D.
(4th ed.) London: The Lancet Ltd.,
1948. xii and 252 pp. Price, 10s. 6d.

It is always interesting to follow the development of a successful textbook in its course through successive editions: to deduce something of the author's development as life and experience impinge on him. The present edition of Hill's book is a thorough revision and expansion of the third (it has 61 more pages) and so incorporates much of the author's thinking in the past years.

The core of the book is unaltered. The presentation is still designed to give the student a clear idea of the simple, essential tools necessary for the statistical attack on quantitative data in medicine and public health. The careful reader will learn to use these tools; what is more important, he will know why he is using a particular one, and its limitations. He should also find it more difficult to draw wrong conclusions from apparently correct procedures—probably the most frequent and damaging fault of statistical analysis.

The bulk of the new material is devoted to the expansion and clarification of points which have proved to be troublesome. A whole new chapter is devoted to "The Average," and a second chapter on "Standardized Indices" has been added. Considerable additions have been made to the discussions of distributions, the characteristics of rates, and the use of "significance" tests. The inclusion of an occasional word or phrase gives evidence of heated arguments which must have taken place in classes, or outside.

HUGO MUENCH

**Oral Vaccines and Immunization
by Other Than Usual Routes—**By
David Thompson and Robert Thomp-

son, assisted by James Todd Morrison.
(Published for the Pickett-Thompson
Research Laboratories, London, Eng-
land.) Edinburgh: E. S. Livingstone,
Ltd., 1948. xi and 329 pp.

This book is a reference work for the research worker interested in immunization by other than parenteral routes, and for this group it should prove of great value. It is divided into four parts, three of which deal with oral immunization, and these sections make up the greater portion, while Part IV is concerned with immunization by other unusual routes, including the respiratory tract, and immunization through the skin by means of ointment vaccines. As stated in the preface, the authors attempt to bring together into one volume the results of many researches on the subject, and although not all of the literature is covered, a large portion is summarized here—a spot check of references on a few diseases discloses this to be so. The bibliography is alphabetical, and the references are unnumbered with relation to the text, making it less handy to use.

The authors feel that immunity can be obtained using vaccines administered by unorthodox routes. It is safe to say that with certain vaccines this is possible, but practical considerations such as size and number of doses is pertinent, and in general the authors' opinion of efficacy is optimistic, measured against what is known today concerning inoculation against the same diseases by the more orthodox routes.

FRANKLIN H. TOP

Tuberculosis Nursing Manual—
By Martha E. Flynn and Doris Roberts,
under the direction of Dr. LeRoy R.
Allen. Baltimore: Maryland State De-
partment of Health, 1948. 40 pp.

The revised tuberculosis section of the *Public Health Nursing Manual* of the Maryland State Department of Health provides the public health nurse

with pertinent information regarding the disease tuberculosis and summarizes the responsibilities of the public health nurse in the tuberculosis nursing service.

In the introduction the authors point out that "the follow-up standards of visits to cases and contacts are minimum and will have to be modified upward at the advice of the physician or at the discretion of the public health nurse." This is important to remember when reading the manual, as some physicians may desire closer supervision and others may feel less supervision is necessary for their tuberculosis patients and contacts. The authors have included summaries of the minimum follow-up standards for tuberculous patients and the minimum follow-up standards for contacts, which is of value as a quick reference. A definition of who is a contact could be included to clarify further the follow-up of contacts.

They point out that the frequency of nursing visits to the home must be decided on an individual family basis and factors influencing this decision are presented. The selection of the public health nurse's tuberculosis case load and the clinic case load is clarified so that supervision is advised for those who need it and not continued indefinitely to families when contact with the source case has been broken over two years.

This manual is carefully prepared with a detailed index and reference. Any nurse who is interested in tuberculosis control will find this book stimulating and valuable, and it is highly recommended for those who are compiling or revising a tuberculosis nursing manual.

HELEN M. GREEN

The Care of the Teeth, Prenatal and in Infancy—By C. Herbert H. Russell, M.B., Ch.B., L.D.S., *Altringham, Eng.: John Sherratt & Son, 1948, 48 pp. Price, 2/ net.*

The author of this handbook for mothers and expectant mothers pre-

sumes that it is not "a matter of chance whether teeth, when erupted, were of good or poor quality, and whether they were arranged evenly or too crowded. . . . Now we know that to a great extent these things can be controlled." Most dental authorities in the United States would not support this premise. As Higley points out, "all the etiologic factors are not known, many are not or cannot be detected until a deformity appears, some are practically unavoidable because inherited. . . . Incipient deformity does and probably always will occur regardless of the dentist's desire to practice prevention." However, our American authority adds "Serious deformity can be minimized if the dentist recognizes incipient deformity."

The concept of dental caries etiology, as expressed in this volume, is likewise not in agreement with the consensus in this country. Most American authorities would contradict the statement that, "difference between good hard teeth and soft chalky teeth is largely dependent upon prenatal care."

This volume clearly indicates the urgent need for research in dental fields. The recent passage by Congress of an appropriation for dental research should therefore be acclaimed by public health personnel.

J. M. WISAN

Ordinance No. 2467 — Providing for the Regulation and Operation of "Care Homes"—*City of Fort Worth, Texas: Public Health and Welfare, 1947.*

This is an extraordinary ordinance. Those who plan to have such an ordinance drawn or amended can profit from its study. This ordinance has good and bad features. The companion "Rules and Regulations" apparently are separately adopted.

Even "Boarding Homes" for persons 60 years or more of age are required to secure permits. The Director of Public Health and Welfare is authorized,

among other things, (1) to determine type as well as the number of patients to be cared for in a given home; (2) to cause the operator, including each member of an association or corporation, to furnish satisfactory evidence of financial responsibility (desirable but probably too extreme and unenforceable); and, (3) to require that the operator file floor plan detailing beds, exits, etc.

Some desirable and unusual requirements set forth in the "Rules and Regulations" include: an isolation room with separate toilet and lavatory for terminal cases; a suitable room for the proper care of the dead pending removal; a properly equipped recreation room; a room where patient may (upon request) talk privately with relatives, clergymen, etc.

A building of wood frame construction, having inside walls and ceilings covered with plaster (on wire lath) or gypsum board, and without enclosed stairwells and boiler room, and, whenever indicated, sprinkler and signal systems, would be disapproved for such use by fire authorities in the New York City Area.

The major shortcomings of the ordinance and its rules appear to be, (1) no provision is made for probationary licensure; (2) publicly operated "Care Homes" are exempted; (3) placement of patients in basement rooms may be permitted; (4) the requirements regarding extent and quality of medical care and supervision of patients in such facilities (although sounder than those in most such ordinances) fall short of those possible, under a hospital affiliation plan (rehabilitation and occupational therapy are not mentioned).

One could question the advisability of admitting alcoholics, providing for appeal of the operator to City Council, requiring health certificates for food handlers, relating number of sanitary installations on all floors to number rather than to extent of ambulation of pa-

tients, stating only a minimal width of beds, prescribing minimal quantity of bedding, linens, etc., in terms of pieces per patient, giving all operators opportunity to qualify for "Life Fee" and having permits expire 1 year after date of issue.

This ordinance has been in effect 8 months. Administrative problems involved in its enforcement should be recounted at an early date.

JOSEPH H. KINNAMAN

Essentials of Nursing—By Helen Young, R.N., Eleanor Lee, A.B., R.N., and Associates. (2nd. ed.) New York: Putnam's, 1948. 556 pp. Price, \$3.75.

This second completely revised edition of one of the important basic texts for students offers up-to-the-minute information on essential nursing procedures. It is well illustrated and with its tables of weights, measurements, abbreviations, and normal values in common diagnostic tests should serve as an indispensable reference book in the offices of public health nursing agencies. It is a pleasure to recommend it unreservedly for that purpose. Anyone wishing more detailed information will find the copious reading lists at the end of each chapter helpful.

DOROTHY DEMING

You Can Lick TB—Handbook for Tuberculosis Patients, Pamphlet 10-18. Washington, D. C.: Veterans' Administration, 1947. 36 pp.

This 36 page handbook for tuberculosis patients, designed for G. I.'s, contains suggestions which civilian tuberculosis hospitals might pursue with profit. It presents in extremely simple, non-technical, sometimes slangy English basic non-controversial facts about tuberculosis, always keeping the patient as a human being and his probable mental attitude in mind.

The patient is warned against false advice and misinformation by others; also against his own failure to follow his

physician's advice. He is reminded of the concern of large numbers of people for his recovery, and of various governmental services, including rehabilitation, available.

The booklet has a cheerful look. Hope of permanent recovery is stressed. Multicolored charts for recording hourly schedules advised by the physician then observed by the patient are included.

JOHN H. KORNIS

Occupational Medicine and Industrial Hygiene—By *Rutherford T. Johnstone, M.D.*; St. Louis: Mosby, 1948, 604 pp. 117 illus. Price, \$10.00.

The largest portion of this well balanced volume is devoted to the clinical aspects of industrial poisonings and diseases. The subject matter is grouped according to the chemical and physical nature of the materials to which the worker is exposed, for example, solvents, metals and dusts. There are, in addition, excellent discussions of the subject of workmen's compensation, the teaching of industrial medicine, functions of the industrial physician, preemployment examinations and the placement program. Industrial hygiene receives lesser emphasis but certainly is sufficiently detailed for the general information of the plant physician.

In all, there are not many textbooks in the field of the occupational diseases and in the past these have, for the most part, been devoted to elaborate descriptions of industrial processes and the substances employed in industry which produce disease. Detailed clinical knowledge of the occupational diseases has been accumulating rapidly during the past twenty years. The real contribution of the present volume is the assembling of such detailed clinical information which is made available to the medical profession in one place.

Two additional portions of the book require mention and commendation. One is a list of chemicals which are present

in common "trade name" products. The second is an outline of methods for the sampling and analysis of atmospheric contaminants, prepared by Senior Chemist, F. H. Goldman of the National Institute of Health.

Many photographic reproductions are presented, some of which are in color. These serve admirably to present some of the bone marrow, blood, and other pathological findings so well described in the text.

It is the opinion of the reviewer that the present volume supplies an important need in the field of the occupational diseases and industrial medicine. The practising physician, as well as the specialist in this field, should find the book of essential importance.

LEONARD GREENBURG

Taking the Cure—By *Robert G. Lovell, M.D.*, New York: Macmillan, 1948. 93 pp. Price, \$2.00.

As a former patient the author of this book has gone through that difficult period of adjustment that every new patient encounters when he enters a hospital for the first time. He has attempted to present to the new patient an explanation and answer to the most perplexing problems that arise in his new environment. At times the phraseology is a bit advanced for many patients in our hospitals and it would have been improved with more illustrations.

In paragraphs listed in the index in the first half of the book, the chief topics of interest to the new patient are discussed briefly. In the latter half of the book the author has delved more deeply into the peculiarities of the disease and here one might wish to find even more complete explanations than are given. So important a part of our program as rehabilitation, for example, is given scant space and such references as occur are barely suggestive of its real possibilities. The patient is to believe that there is a better life ahead but

he is shown few real guides to achieve it once his hospital phase is completed. Also, it would have been valuable had the author discussed the facilities for supervision and care outside the hospital. Nothing is said about the family doctor, the health department, the visiting nurse, and other agencies that so frequently contribute in some manner to the well-being of the patient and his family. The appendix presents excellent suggestions on the art of reading, listening to music, and a few games.

This is a worth while book that will help many patients in the hospital to understand more clearly their personal responsibility in the cure of their disease.

HERBERT R. EDWARDS

Mental Health in Modern Society
—By Thomas A. C. Rennie, M.D., and Luther E. Woodward, Ph.D. New York: The Commonwealth Fund, 1948. 410 pp. Price, \$4.00.

This is really two books in one; a genuine bargain for those interested in both subjects treated. Parts I and II of the text deal with psychiatric lessons learned from the recent war. Part III, the latter half of the book, moves into what may be termed the public health phase of mental hygiene, and justifies the title *Mental Health in Modern Society*.

This title will attract the attention of an ever-widening circle of persons concerned, both for themselves and others, with developing and maintaining amidst the perplexities of the times this priceless thing called mental health. Although there is danger that some war-weary minds will be repelled by the opening chapters devoted to the psychiatric problems of war, yet the contents of Part III will more than repay earnest seekers after the more comprehensive desiderata promised by the title.

Public health mental hygiene, as stated in the preface, rests on the promise that "Whereas the clinician's con-

cern is with illness, the public worker is concerned with positive help. His job is keeping people well. . . . His effort is directed primarily to finding and controlling foci of infection. By analogy, those who are concerned with mental health will have to deal with ignorance, superstition, unhealthy cultural patterns, and the rigidities and anxieties of parents, as well as with social conditions which foster the development of neuroses and maladjustment."

Chapters XII and XIII, devoted respectively to Family Living and Education, comprise one of the most adequate statements known to the reviewer of the basic concepts of preventive mental hygiene. These chapters alone are worth the price of the book. The remainder of Part III—dealing by chapters with the contributions of practicing physicians, social workers, psychologists, pastoral counseling and church life, mental hygiene in industry, and interviewing and counseling—all support the central thesis that "mental health problems are to a large degree socially conditioned and that to promote mental health it is necessary to give attention to groups as well as to individuals."

This book, specifically for the special contents noted above, is strongly recommended for all public health workers.

PAUL H. STEVENSON

Noah Webster: Letters on Yellow Fever Addressed to Dr. William Currie—Introductory essay by Benjamin Spector. (*Supplements to the Bulletin of the History of Medicine No. 9.*) Baltimore: The Johns Hopkins Press, 1947. vi + 110 pp. Price, \$2.00.

In the history of American civilization, the name of Noah Webster stands out preëminently as a lexicographer and schoolmaster. Like so many of his contemporaries, however, Webster had a wide variety of other interests, among

them various scientific subjects. His major contribution to science was in the field of epidemiology, culminating in the publication in December, 1799, of his *Brief History of Epidemic and Pestilential Diseases* (2 volumes). This work is noteworthy on two grounds: it offers an excellent summary of epidemiological thought at the close of the 18th century, including a history of epidemiological theory from ancient times to 1799; and it presents a clear exposition of the anticontagionist standpoint with particular reference to the influence of the epidemic constitution in the causation of pestilence.

Webster had arrived at this position after a decade of study. The basis for the *Brief History* had, however, already been published several years earlier. It appeared in 1797, in the October, November, and December issues of the *New York Commercial Advertiser* as a series of 25 letters addressed to Dr. William Currie of Philadelphia. When yellow fever appeared in Philadelphia in 1797, Dr. Currie had written a series of newspaper letters advocating the theory that the disease was propagated by contagion and had been imported. Webster denied the foreign origin of the disease and asserted that it arose from local causes.

These letters Dr. Benjamin Spector has reissued, together with an introductory essay in which he appraises Webster's contribution to American medical thought, and in particular evaluates the content of the letters in terms of epidemiological ideas prevalent at the

time. Webster's letters will be of interest to all those who realize that epidemiology is still a science with many unsolved problems, and that in essence the riddles that Webster tried to solve are still with us. Dr. Spector is to be congratulated for having made these letters available to a wide audience.

GEORGE ROSEN

Laboratory Experiments in Physiology—By *William D. Zoethout, Ph.D., Professor Emeritus of Physiology in the Chicago College of Dental Surgery (Loyola University)*. (4th ed.) St. Louis: Mosby, 1948. 263 pp. Price, \$3.00.

This is the fourth edition of a standard and widely used manual covering laboratory experiments designed to give firsthand information on all the major functional aspects of biological systems, particularly as these relate to human physiology. The first two chapters deal with the properties of experimental equipment and the nature of relevant chemical and physical systems and their effects on body function. Experiments are arranged in the eleven chapters of the first part of the manual on the basis of the body system under consideration. The second part of the manual deals in six chapters with metabolism, nutrition, and related biochemistry. The textual treatment is brief and, like the physical aspects of the book itself, is of a high order. This modest volume deserves continued success.

DONALD YOUNG SOLANDT

BOOKS RECEIVED

Listing in this column acknowledges the receipt of books and our appreciation to the senders. Space and the interests of readers will permit review of some, but not all, of the books listed.

- ADVANCES IN BIOLOGICAL AND MEDICAL PHYSICS. Vol. I. John H. Lawrence and Joseph G. Hamilton. New York: Academic Press, 1948. 484 pp. Price, \$8.60.
- ADVANCES IN PEDIATRICS. Vol. 3. S. Z. Levine, Allan M. Butler, L. Emmett Holt, Jr., A. Ashley Welch. New York: Interscience, 1948. 363 pp. Price, \$7.50.
- DAIRY MANUFACTURING PROCESSES. E. L. Fouts and T. R. Freeman. New York: Wiley, 1948. 237 pp. Price, \$3.50.
- EVERYDAY MIRACLE. Gustav Eckstein. New York: Harper & Brothers, 1948. 235 pp. Price, \$2.75.
- FELLOW AMERICANS. Vol. I. Orientation: The World We Live In. Syrus Bass. Chicago: Atomic Age Publishers, 1948. 501 pp. Price, \$3.75.
- MEDICAL WRITING. Morris Fishbein, M.D. (2nd ed.). Philadelphia: Blakiston, 1948. 292 pp. Price, \$4.00.
- MORE THAN ARMIES. The Story of Edward H. Cary, M.D. Booth Mooney. Dallas: Mathis, Van Nort, 1948. 270 pp. Price, \$5.00.
- NEW TECHNIQUES OF HAPPINESS. Albert Edward Wiggam, D.Sc., LL.D. New York: Wilfred Funk, 1948. 352 pp. Price, \$3.75.
- NURSING FOR THE POLIOMYELITIS PATIENT. Prepared and Published by the Joint Orthopedic Nursing Advisory Service of the National Organization for Public Health Nursing and the National League of Nursing Education. New York: N.O.P.H.N., 1948. 88 pp. Free.
- PEDIATRIC NURSING. Gladys S. Benz, R.N., B.S., M.A. St. Louis: Mosby, 1948. 638 pp. Price, \$4.00.
- PIONEER HEALTH CENTRE—Peckham, London. London: National Trust for the Promotion and Study of Health. 16 pp. Price, 6d.
- PLANNING FOR HEALTH IN POSTWAR HAWAII. Public Health Committee. Honolulu, Hawaii: Chamber of Commerce, 1948. 76 pp.
- PRACTICAL BACTERIOLOGY, HEMATOLOGY, AND PARASITOLOGY. E. R. Stitt, M.D., Paul W. Clough, M.D., and Sara E. Branham, M.D. (10th ed.). Philadelphia: Blakiston, 1948. 989 pp. Price, \$10.00.
- PUBLIC HEALTH ENGINEERING. Vol. I. Earle B. Phelps. New York: Wiley, 1948. 655 pp. Price, \$7.50.
- RONALD ROSS, DISCOVERER AND CREATOR. R. L. Mégroz. New York: Macmillan, First Published in 1931. 282 pp. Price, \$3.00.
- SOCIAL DENMARK. A Survey of the Danish Social Legislation. Edited and Published by Socialt Tidsskrift Copenhagen, 1947. 475 pp.
- SOCIAL GROUP WORK. Principles and Practices. Harleigh B. Trucker. New York: Woman's Press, 1948. 313 pp. Price, \$3.50.
- SURVEY OF FOOD AND NUTRITION RESEARCH IN THE U. S., 1947. Washington, D. C.: National Research Council, 1948. 306 pp. Price, \$1.00.
- SUCCESSFUL MARRIAGE: A MODERN GUIDE TO LOVE, SEX AND FAMILY LIFE. Edited by Morris Fishbein, M.D., and Ernest W. Burgess, Ph.D. New York: Doubleday, 1948. 547 pp. Price, \$6.00.
- YOUR DILT FOR LONGER LIFE. James A. Tobey, Dr.P.H. New York: Wilfred Funk, 1948. 280 pp. Price, \$3.50.
- ZINSSER'S TEXTBOOK OF BACTERIOLOGY. Revised by David T. Smith, M.D., Donald S. Martin, M.D., M.P.H., Norman F. Conant, Ph.D., Joseph W. Beard, M.D., Grant Taylor, M.D., Henry I. Kohn, Ph.D., M.D., and Mary A. Poston, M.A. (9th ed.). New York: Appleton-Century-Crofts, Inc., 1948. 992 pp. Price, \$10.00.

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Unfancy Writing — All right, infant hygiene isn't your job! Very well, you aren't a baby's parent! Read this paper anyway. (Time out for your skimming.) Have you ever seen a scientific treatise with less stuffy writing? Or one more readable? The reason the writer wished to remain anonymous is beyond my comprehension.

ANON. "Baby Independence": A Mother-Baby Situation. *Pub. Health Nurs.* 40, 7:359 (July), 1948.

Some Mild, Tepid Crowing—None of the large cities had a diphtheria mortality rate (for 1947) in excess of 5. Those cities with no deaths increased to 49. These are the best records since 1940, and the total of all diphtheria deaths in all the cities was lowest on record.

ANON. Diphtheria Mortality in Large Cities of the United States in 1947. *J.A.M.A.* 137, 17:1525 (Aug. 21), 1948.

Tuck This Away—Routine use of alum-precipitated diphtheria toxoid and pertussis vaccine mixture should give a higher degree of protection against diphtheria than the toxoid alone. This is just one finding of a nicely controlled study.

BILL, J. A. Diphtheria Immunization. *J.A.M.A.* 137, 12:1009 (July 17), 1948.

Just Pure Fun — Please don't anybody miss this. It's Mary Ellen Chase at her best.

CHASE, M. E. The Country Doctor on the Maine Coast. *New England J. Med.* 239, 8:283 (Aug. 19), 1948.

What Do People Like to Read?—What they can read easily, says this student of writing. Perhaps this discussion of easy reading will prod you to buy Flesch's *The Art of Plain Talk* if the preceding paper by this writer—praised in the February bibliography—didn't quite send you to your book sellers. What about exposing your mind to that danger a second time?

COWING, A. G. Writing That Sells Good Diet. *J. Am. Dietet. A.* 24, 7:592 (July), 1948.

New Broom—How the \$3,000,000 grants-in-aid for state mental hygiene programs are being put to work is a matter you should know about. In five short months, wonders have been accomplished, but the job ahead is as formidable as ever.

FELIX, R. H. The National Mental Health Program. *Pub. Health Rep.* 63, 26:837 (June 25), 1948.

Population vs. Subsistence—Do you occasionally feel the urge to look up from, and beyond the confines of, your particular job? Well, here are nine grim papers about modernizing undeveloped areas, that make stimulating—if not easy—reading. If nine are more than you find assimilable, then read the one about what WHO proposes to do about the health of these areas.

FORREST, W. P., *et al.* Health Aspects of International Approaches to Problems of Undeveloped Areas. *Milbank Quart.* 26, 3:280 (July), 1948.

Not for Nurses Only—These questions are raised: Is mental ill health a major public health problem? Can nurses give the same sort of help in this field that they do in their "regular" work? Can they do it without neglecting the rest and without psychiatric training? Are you interested in the answers? You'll get some of them here.

GUNDY, C. H. Mental Hygiene in the Child Health Program. *Canad. Pub. Health J.* 39, 7:255 (July), 1948.

Miscellany — Of all the scientific periodicals I read, the (British) *Health Education Journal* gives me the most pleasure. In this issue, for instance, the latest pronouncements on dental health are set forth by our A. D. A.'s Executive Secretary. In a postscript, the editor says blandly, this is what the Americans think, the authoritative British viewpoint differs. In the same number are a variety of papers on psychological problems of marriage, industrial hygiene, and medicine in the ancient world. Gebhard tells about the Cleveland Museum.

GRUEBEL, A. O. New Concepts in Dental Health Education. *Health Education J.* 6, 3:117 (July), 1948.

Seeing It in Print Helps—This sage advice to dieticians about child feeding "Be ready to listen to the child. He often talks more sense than we realize," carries overtones of meaning

for many, many workers in the health field. The whole paper is excellent and comes from one who knows whereof she speaks.

LEE, F. L. The Child's Idea of What and How to Eat. *J. Am. Dietet. A.* 24, 8:658 (Aug.), 1948.

Fortunate Blunder—Quite by accident the water supply of three New Jersey towns became fluorinated. Nearby are three comparable towns continuing to enjoy fluorine-free drinking water during the 19 years the residents of the first ones were consuming 1.2 to 2.2 p.p.m. of fluorine. No, I won't spoil this story by giving you the nub of the findings here. There is more to come, so you should begin by reading this issue.

KLEIN, H. Dental Effects of Accidentally Fluorinated Water: 1. Dental Caries Experience in Deciduous and Permanent Teeth of School Age Children. *J. Am. Dent. A.* 36, 5:443 (June), 1948.

Isn't This the Limit?—Conditions producing good general health were found to be associated with severe dental decay, and conversely, poor health was associated with excellent teeth. If that quote doesn't give you pause, as the orators put it, what will?

LARSEN, N. P. Tooth Decay in Relation to Diet and General Health. *J.A.M.A.* 137, 10:832 (July 3), 1948.

More Bad News—No protective effect following influenza A and B vaccination given 4 to 5 months prior to an outbreak in 1947 was evident among a large group of college students. There was no close antigenic relationship between the viruses in the vaccine and the strain causing the epidemic.

LOOSLI, C. G., *et al.* Results of Vaccination Against Influenza During the Epidemic of 1947. *J. Lab. & Clin. Med.* 33, 7:789 (July), 1948.

Politely Disagreeing—This is an answer to Wolman's suggestions that we go slow in the medication of municipal

water supplies with fluorine, and that we "wait and see." The writer balances the probable advantages and *known* disadvantages and says let's get going.

NICHOLS, M. S. Supplementing Water Supplies with Fluorine. *J. Am. Water Works A.* 40, 7:751 (July), 1948.

Nest Egg—Here's something there should be more of! The nurses have worked hard to determine how much it costs to make a home visit and to give other nursing services. Doesn't anyone care how much other public health activities cost?

REID, M. What Does Public Health Nursing Cost? *Pub. Health Nurs.* 40, 8:399 (Aug.), 1948.

Department of Syphilologic Ignorance—Just because penicillin seems to be resolving most of our therapeutic problems concerned with syphilis, there is no reason for our dropping all the experimental researches that need to be done before we know enough about that infection. The amazing extent and diversity of our syphilologic naivete will be clear to anyone who skims this review.

STOKES, J. H., and BEERMAN, H. Some Problems in the Biology of the Syphilitic Infection. *Am. J. M. Sc.* 215, 4:461 (Apr.), 1948.

It Works: They Say—In five representative cities, health or city planning officials used our housing appraisal form and found it helpful in determining where sub-standard dwellings exist, why they are sub-standard, and what can be done about them.

TIBONI, E. A., *et al.* Systematic Inspection of Sub-Standard Housing. *American City.* 63, 5:82 (May), 1948.

Sporting Event—Do you enjoy witnessing an occasional good, clean fight? Then you'll rise to the expert drubbing this Swedish proponent of BCG vaccination administers to a distinguished British opponent. This is all aside from the merits of the cause of the battle royal, quite naturally. A following paper on BCG vaccination should be read, too.

WALLGREN, A. B.C.G. Vaccination: Is It of Any Value in the Control of Tuberculosis? (and) MALMROS, H. The Efficacy of B.C.G. Vaccination. *British M. J.* 4562:1126 (June 12), 1948.

ASSOCIATION NEWS

SEVENTY-SIXTH ANNUAL MEETING
AMERICAN PUBLIC HEALTH ASSOCIATION
BOSTON, MASS., NOVEMBER 8-12, 1948

Hotel Reservations at Boston

Members are asking which is the "Headquarters" hotel for the Boston Annual Meeting. The answer is that no one hotel has been designated headquarters for delegates because Boston's hotels, though numerous, are not large.

A Housing Bureau is being operated for the Association by the Boston Convention Bureau. We are asking members to select their own hotel from among those listed on page 1178. The application should be carefully filled in and mailed to:

The Housing Bureau
Boston Chamber of Commerce
80 Federal Street
Boston, Mass.

Convention activities will center largely in Mechanics Building. We rearrange the list of hotels below to show you their location with relation to Mechanics Building. No. 1 is nearest, 2 next in order of distance, and so on.

- | | | |
|-----------------------|-------------------------|----------------------|
| 1—Hotel Minerva. | 6—Hotel Statler | 16—Hotel Manger |
| 2—Copley Square Hotel | 7—Hotel Bradford | 16—The Parker House |
| 3—Copley Plaza Hotel | 8—Hotel Touraine | 17—Hotel Continental |
| 4—Hotel Lenox | 9—Hotel Puritan | 13—Hotel Kenmore |
| 5—Hotel Gardner | 10—Hotel Somerset | 14—Hotel Braemore |
| 5—Hotel Hemenway | 11—Hotel Myles Standish | 15—Hotel Bostonian |
| 5—Hotel Vendome | 12—Hotel Sheraton | 16—Hotel Bellevue |

Single rooms are few and are hard to obtain. Rooms for double occupancy are strongly recommended. There is no question about the ability of Boston's hotels to accommodate the delegates to the Annual Meeting, but the Housing Bureau and the Local Committee ask the coöperation of the membership in seeking double rather than single room accommodations.

A.P.H.A. membership application blank on page XXXV

THE 76TH ANNUAL MEETING
Boston, Mass., November 8-12, 1948

Hotel Reservation Form

The hotels listed below have rooms available for Association delegates at the rates indicated. Please note that NO RESERVATIONS WILL BE ACCEPTED DIRECTLY BY HOTELS. Make your reservation through:

The Convention Bureau, Boston Chamber of Commerce, 80 Federal Street, Boston 10, Mass.

| <i>Hotels</i> | <i>Singles</i> | <i>Doubles</i> | <i>Twin Beds</i> | <i>Suites</i> |
|----------------|----------------|----------------|------------------|-----------------|
| Bellevue | \$4.00-\$6.00 | \$6.00-\$8.00 | \$7.25-\$10.00 | \$12.00-\$15.00 |
| Bostonian | 3.00- 4.50 | 5.00- 6.50 | 5.00- 7.00 | 8.00- 10.00 |
| Bradford | 4.00- 6.00 | 6.00- 7.00 | 6.50- 8.00 | 12.00- 14.00 |
| Braemore | 4.40- 6.60 | 6.40- 9.90 | 6.60- 9.90 | 9.90- 25.00 |
| Continental | 3.50- 4.00 | 6.60 | 7.00 | 8.00- 25.00 |
| Copley Plaza | 4.50- 6.60 | 7.75- 8.80 | 8.80- 10.00 | 15.00- 25.00 |

THE HOTEL IS NOTIFIED OF LATE ARRIVALS

PROPOSED AMENDMENTS TO CONSTITUTION OF THE AMERICAN PUBLIC HEALTH ASSOCIATION

THE Committee on Constitution and By-laws presents herewith for the information of the Fellowship certain proposed amendments to the Constitution of the American Public Health Association. The changes proposed affect the voting privileges of members and Fellows and they grow out of a careful consideration of the subject given by the Executive Board and the committee in an attempt to broaden the basis of participation in Association affairs.

Four amendments will be necessary to put into effect the changes that have been recommended by the Executive Board and approved by the Committee on Constitution and By-laws and by the Governing Council, and they occur in Section 2 of Article III, Sections 1 and 2 of Article IV, and in Article VIII of the present Constitution. Amendments No. 1 and No. 2 provide for the election of the ten elective members of the Governing Council by the members and Fellows instead of by Fellows only; Amendment No. 3 clarifies the terms of newly elected Councilors which begin with the first meeting of the new Governing Council which is held immediately after the old Governing Council adjourns; Amendment No. 4 provides for a mail vote by Fellows on amendments to the Constitution instead of restricting this important responsibility to the Fellows present and voting at an Annual Meeting. Another important

change that has been proposed is to allow members and Fellows to vote in a mail ballot for the elective members of the Governing Council instead of limiting the balloting to the time of the Annual Meeting. However, this change involves an amendment to the By-laws which will be presented for the consideration of the Governing Council at the Boston Annual Meeting, together with certain other By-law changes that have been recommended.

The attention of the Fellows is directed to the fact that in these suggested modifications of the present system no change is proposed in the exclusive right of Fellows to hold office in the Association and in the Sections, to serve as chairmen of committees and as members of standing committees, and to vote upon amendments to the Constitution.

The four amendments were submitted to the 106 members of the Governing Council of the Association in a memorandum from the Executive Secretary dated and mailed July 20 and were overwhelmingly approved.

The entire Constitution is reprinted below and the amendments are clearly indicated in the sections concerned. The amendments will be adopted if approved by a two-thirds vote of the Fellows of the Association present and voting at the Boston Annual Meeting in November.

NOTE: Amendment No. 1 is shown in Article III, Membership, Section 2.

Amendment No. 2 is shown in Article IV, Governing Council Composition, Section 1, paragraph (e).

Amendment No. 3 is shown in Article IV, Governing Council Composition, Section 2.

Amendment No. 4 is shown as an entire revision of Article VIII, Amendments.

In these sections, new material is in bold face type and material to be deleted is in parentheses.

CONSTITUTION OF THE AMERICAN PUBLIC HEALTH ASSOCIATION SHOWING AMENDMENTS
PROPOSED FOR ADOPTION AT THE BOSTON ANNUAL MEETING

ARTICLE I NAME

The name of this Association, incorporated under the laws of Massachusetts, is the American Public Health Association.

ARTICLE II OBJECT

The object of this Association is to protect and promote public and personal health.

ARTICLE III MEMBERSHIP

Section 1. There shall be seven classes of constituents to be designated as Fellows, Honorary Fellows, Members, Sustaining Members, Life Members, Affiliated Societies, and Regional Branches.

Section 2. The right to hold office, except the office of Vice-President, or to serve as a member of the Governing Council, the Executive Board, or of a Section Council, or of a standing committee, or as the chairman of a committee of the Association or of a Section, or to vote (for elective Councilors or) on any amendment to the Constitution shall be limited to Fellows and to Life Members and Honorary Fellows who have been elected Fellows of the Association.

Section 3. The qualifications of the several classes of constituents, and the dues of each of them, the manner of their election, and their rights and privileges, except as specified in this Constitution, shall be established in the By-Laws.

ARTICLE IV GOVERNING COUNCIL COMPOSITION

Section 1. There shall be a Governing Council which shall consist of:

(a) The officers of the Association and the elective members of the Executive Board.

(b) The Chairman, Vice-Chairman, and Secretary of each Section, and the elective members of the Council of the Health Officers Section.

(c) One representative to be designated by each Affiliated Society.

(d) One representative to be designated by each Regional Branch.

(e) Thirty members of the Council, to be elected by the (Fellowship) Fellows and Members of the Association; for three-year terms, one-third of whose terms shall expire each year. Such members of the Council shall be known as elective Councilors and shall be nominated and elected as provided for in the By-Laws. If an elective Councilor is elected a Section Chairman, Vice-Chairman, or Secretary, or an elective member of the Council of the Health Officers Section, or appointed the representative of an Affiliated Society, or of

a Regional Branch, a Councilor to fill such vacancy shall be elected by the Governing Council. All vacancies while in office shall be filled by election for the unexpired term. After two consecutive terms, an elective Councilor shall be ineligible for reelection to the Council during one Association year.

Section 2. The terms of all Councilors, except the representatives of Affiliated Societies and Regional Branches, shall begin (at the end of the annual meeting at which they are elected) immediately following the adjournment sine die of the Governing Council in existence at the time of their election and shall terminate (at the end of) with the adjournment sine die of the Governing Council at the annual meeting at which their respective terms expire; provided that newly elected Councilors shall have the right to attend meetings of the Council in an advisory capacity as soon as elected.

The terms of the representatives of Affiliated Societies and Regional Branches shall begin and terminate in accordance with the constitutions and by-laws of their respective organizations.

Section 3. The Officers of the Association shall be the Officers of the Council.

Section 4. A Quorum of the Council shall consist of twenty Councilors.

Section 5. Meetings of the Council shall be called by the Executive Secretary at the request of the President, or at the request in writing of any twelve Councilors. In the latter case, the call to the meeting shall be issued at least twenty days in advance of the meeting and shall state the purpose for which it is called.

ARTICLE V GOVERNING COUNCIL FUNCTIONS

The functions of the Governing Council shall be:

Section 1. To establish and amend the By-Laws of the Association.

Section 2. To establish policies for the Association and for the guidance of the Executive Board and the Officers.

Section 3. To consider all resolutions proposed for approval in the name of the Association, and to receive and act upon a report from a committee on resolutions appointed annually by the President.

Section 4. To approve all standards promulgated in the name of the Association.

Section 5. To receive at its first session at the time and place of the annual meeting of the Association, a report from the Chairman of the Executive Board in which the work, the

accomplishments, and the financial status of the Association during the year preceding such annual meeting shall be reviewed and a statement made of the major activities contemplated for the ensuing year.

Section 6. To establish Sections of the Association; to combine or discontinue them when necessary; to prescribe the qualifications of the members of Section Councils and the chairman of section committees; to maintain coordination among Sections; and to formulate general rules governing their policies.

Section 7. To elect the Executive Board, the officers of the Association, with the exception of the Chairman of the Executive Board and the Executive Secretary, to elect Fellows, Honorary Fellows, Life Members, and Affiliated Societies, and to establish Regional Branches.

Section 8. To publish after each of its meetings an abstract of the minutes of such meeting.

ARTICLE VI. OFFICERS

The officers of this Association shall be a President, a President-elect, three Vice-Presidents, an Executive Secretary, a Treasurer, and the Chairman of the Executive Board. The officers, with the exception of the Chairman of the Executive Board and the Executive Secretary, shall be elected by written ballot of the Governing Council as provided in this article and in the By-laws. The President-elect shall serve as such from the close of the annual meeting at which he was elected to the close of the next annual meeting, when he shall automatically become President. As President he shall serve to the close of the next succeeding annual meeting. However, in case of the inability of the President to complete his term for any reason, the President-elect shall at once succeed to the duties of President, filling the unexpired term of his predecessor and his own term consecutively. Other officers, except the Chairman of the Executive Board and the Executive Secretary, shall serve from the close of the annual meeting when elected until the close of the next annual meeting, and all officers shall serve in any case until their successors are elected and qualified. A majority vote of the Councilors voting shall be required to elect, and if no candidate receives a majority vote on the first ballot, the candidate receiving the smallest number of votes shall be dropped after each ballot in succession until a majority vote is obtained. The Chairman of the Executive Board and the Executive Secretary shall be elected by the Executive Board, which Board shall define the duties and authority of these officers, respectively.

ARTICLE VII EXECUTIVE BOARD

Section 1. There shall be an Executive Board, consisting of the President, the President-elect, the Treasurer, and six members, to be known as the Elective Members, elected for terms of three years each by the Governing Council. The Elective Members shall be at the time of their election past or present members of the Governing Council. The terms of the Elective Members shall begin at the close of the annual meeting at which they are elected and terminate at the end of the annual meeting at the expiration of their respective terms. The terms of two Elective Members shall expire each year in rotation.

Section 2. Acceptance of membership on the Executive Board shall terminate any appointment such Fellow may hold on any of the standing committees of the Association.

Section 3. It shall be the duty of the Executive Board to direct the administrative work of the Association; to act as the Trustee of the Association's properties; to elect the Members and Sustaining Members; and in general to carry out the policies of the Governing Council between meetings of the latter.

It may designate an Assistant Treasurer whose powers shall be limited to the disbursement of funds in accordance with duly authorized budgets for the ordinary conduct of Association business. Such power shall be exercised only during a period when, in the opinion of the Board, an emergency is created due to the absence or disability of the Treasurer. Such Assistant Treasurer may be a Fellow or a corporate fiduciary institution.

In the event of a vacancy in the office of Treasurer, the Executive Board shall have power to elect a Fellow to serve as Treasurer for the unexpired term.

It shall have such further powers and duties as may be prescribed in the By-Laws.

Section 4. A Quorum of the Executive Board shall consist of five members.

ARTICLE VIII AMENDMENTS

This Constitution may be amended by the Fellows of the Association voting thereon in a ballot cast by mail, provided that the specific amendment to be acted upon is published in the official publication of the Association not less than thirty days prior to the mailing of the ballots to the Fellows by the Administrative Office, and provided further that the amendment has received prior approval by the Governing Council. The closing date for the reception of ballots shall be forty-five days from the date of the mailing of the ballots.

by the Administrative Office. An amendment shall become effective only upon receiving an affirmative vote on two-thirds of the ballots cast by the Fellows. The

President shall designate Tellers to canvass the ballots and to report the result to the Governing Council as provided in the By-Laws.

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

Martin F. Buell, M.D., 40 S. Washington St., Easton, Mich., Private Practice
Percy F. de Caïnes, M.B., M.P.H., P. O. Box 199, Georgetown, British Guiana, Health Officer, British Guiana Medical Dept., and Chief Medical Officer, Mosquito Control Service.

Robert L. Worthington, M.D., 3617 W. 6th St., Topeka, Kans., Medical Director, Menninger Sanitarium

J. B. Yutzy, 417 E. 13th St., Kansas City 6, Mo., Administrative Analyst, U.S.P.H.S.

FIRST ANNUAL CONFERENCE OF FISCAL, BUSINESS, PERSONNEL AND PLANNING
OFFICERS OF STATE AND TERRITORIAL DEPARTMENTS OF HEALTH

A group of administrative officers are desirous of organizing all health department officers concerned with Administrative Management (Fiscal, Business, Personnel, and Planning and Procedures) into one group or organization to provide a means for interchange of information, discussion of problems and ideas pertinent to this important phase of health department organization and administration.

It was agreed that membership in the American Public Health Association would give us the contacts and provide the facilities at the Annual Meetings to achieve our objective.

Accordingly, a committee was appointed to further this organization idea. The committee has circularized all

health department officers concerned with administrative management whose names were furnished by the state and territorial health officers, and the response in A.P.H.A. membership applications has been sufficiently successful to warrant a conference.

This conference will be devoted primarily to formal organization of the group, election of temporary officers, appointment of committees, and laying plans for next year's conference.

All health department officers engaged in administrative management are invited and urged to attend this conference. Please refer to the program of the A.P.H.A. Annual Meeting in Boston for particulars as to time and place.

LETTER TO THE EDITOR

TO THE EDITOR:

Many thanks for sending me a copy of Colonel Hardenbergh's comment concerning my article in the July number of the *American Journal of Public Health*. His complaint is entirely justified. My apologies to him and to the U. S. Army and Navy for failing to mention the impressive amount of anti-malaria work accomplished within military establishments in the Continental United States during the war years. That these preventive efforts contributed significantly to the minimal malaria experience of the Armed Forces in this country during World War II can hardly be doubted.

I am very sorry that the omission occurred. I can hardly claim to be unaware of the cantonmental malaria prevention operations. I suspect that I was so absorbed in the purely civilian phases of my thesis that I failed to include the military accomplishments. The omission was certainly not intentional.

JUSTIN M. ANDREWS,
*Medical Director in Charge,
Communicable Disease Center,
U. S. Public Health Service,
Atlanta, Ga.*

August 2, 1948

EMPLOYMENT SERVICE

The following pages present information for those seeking qualified public health personnel and for those seeking positions in public health.

This is a service of the Association conducted without expense to the employer or employee.

Address all correspondence to the Employment Service, A.P.H.A., 1790 Broadway, New York 19, N. Y., unless otherwise specified.

(Supplemental to list in September Journal)

POSITIONS AVAILABLE

Sanitarian with some college training or practical experience in sanitation for Effingham County, Illinois, population 22,000. Salary range \$250 to \$290 monthly. Immediate employment. Write: Fred O. Tonney, M.D., Medical Director, Shelby-Effingham Bicounty Department of Health, 511½ West Fayette Avenue, Effingham, Illinois. Tel. 1580; or 206 Morgan Street, Shelbyville, Illinois, Tel. 480.

Sanitarians (two); general environmental sanitation. County population 83,000. Annual salaries \$3,600 and \$3,120. Write: Irving D. Johnson, M.D., Health Officer, Marin County Health Dept., 704 Fourth Street, San Rafael, Calif.

Laboratory Technician, male or female, for city Health Department laboratory. Must have certificate. Salary \$200 monthly. Write: J. M. Cameron, M.D., Health Officer, City Hall, St. Joseph 56, Mo.

Tuberculosis Supervisor: opening for public health nurse with graduate course in TB, B.S. degree and some experience in supervision. Program in generalized visiting nurse association carrying official TB nursing for the city. Affiliation with university. Beginning salary \$265 monthly. Retirement plan and progressive personnel policies. Write: Mrs. Elizabeth Martin, Visiting Nurse Assn., 1008 SW 6th Ave., Portland 4, Ore.

Full-time Dentist to serve as dental clinician in rural school dental health program. Salary \$5,000 per annum. Appointee will operate a modern mobile dental unit. Write: Mrs. Alfred Chanutin, President, Child Welfare Assn., Room 201, Jefferson Theater Bldg., Charlottesville, Va.

Health Educator for Chicago and Cook County TB Institute with public health background and experience. Salary open. Excellent opportunity for developing broad education in TB control programs in community, industry, and schools in co-operation with the official agency. Write: Elizabeth Dean, Tuberculosis Institute of

Chicago and Cook County, 1412 West Washington Blvd., Chicago 7, Ill.

NEWS FROM THE FIELD

INTERNATIONAL CLASSIFICATION OF DISEASES, INJURIES AND CAUSES OF DEATH ADOPTED

THE International Statistical Classification of Diseases, Injuries and Causes of Death was adopted by the International Revision Conference at its decennial meeting held in Paris, April 26-30, 1948. This sixth decennial revision of the *International List of Causes of Death* provides for the first time a uniform basis for the compilation of both mortality and morbidity statistics to serve the growing needs for a satisfactory classification of causes of illness.

The International Revision Conference, to which delegates from 29 countries were represented, took other significant actions. The Conference adopted a standard form of medical certification of death designed to serve as a basis for the selection of the underlying cause of death for primary mortality tabulations. Also agreed to were the principles and the basic rules for selecting the underlying cause of death which, in the United States, will replace the *Manual of Joint Causes of Death* first introduced in published form in 1914. In regard to future studies of important vital and health statistics problems, the Conference recommended the establishment of national committees to conduct studies and report their findings to the Expert Committee on Health Statistics of the World Health Organization.

The users of the past revisions of the *International List of Causes of Death* may be interested to find that typhoid fever, designated as International List No. 1 through each of the past five decennial revisions, has finally given way to one of the tuberculosis rubrics

in the sixth revision. Sweeping changes were incorporated in the *International Statistical Classification of Diseases, Injuries and Causes of Death*, but most of these changes were made within the general structure of the *International List of Causes of Death*. Of particular significance was the expansion of the list from 450 to 610 categories for diseases and morbid conditions, plus 153 categories for the classification of the external causes of injuries and 189 categories for the characterization of injuries according to their nature. The classifications of injuries are supplements to the disease code, and either the classification according to the external circumstances of the violence or the classification by the nature of injury, or both, may be used.

The new classification consists of obligatory three-digit categories and optional fourth digit subdivisions. The numbering system employed in the code is adapted to mechanical tabulating equipment in contrast to that of the past revisions which required translation of the code from alphabetic to numeric and back to alphabetic in the final tabulations.

The *International Statistical Classification of Diseases, Injuries and Causes of Death* will be published by the World Health Organization in two volumes. The first volume will consist of the introduction, list of categories, the tabular list of inclusion terms, medical certification and rules of classification, and special tabulation lists. The second volume will consist of the alphabetical index of terms and an appendix of rules for coding the underlying

cause of death. It is expected that the two volumes will be available for distribution by January, 1949, when the new classification will be introduced. The World Health Organization will also issue a French and a Spanish edition of the classification.

The international adoption of the new list is a source of gratification to the United States, since it was the U. S. Committee on Joint Causes of Death that produced the original draft of the morbidity-mortality classification. It may be remembered that the U. S. Committee on Joint Causes of Death was one of the recipients of the 1947 Lasker Awards for its work on the classification list. The U. S. Committee on Joint Causes of Death submitted the proposed classification in 1946 to the Expert Committee of the World Health Organization on the Preparation for the Sixth Decennial Revision of the International Lists of Diseases and Causes of Death. The Expert Committee made some modifications in the list after submission to various governments for criticisms and suggestions. The extensive preparatory work which started in 1945 culminated in the unanimous adoption of the classification at the Paris Conference in April, 1948.

The delegates to the International Revision Conference from the United States were: Dr. Halbert L. Dunn, Public Health Service (Chairman); Dr. George Baehr, New York Academy of Medicine; Dr. Harold F. Dorn, Public Health Service; Dr. Edwin F. Daily, Children's Bureau; Dr. Paul M. Densen, Veterans Administration; Dr. W. Thurber Fales, Baltimore City Health Department; Dr. E. L. Hamilton, Office of the Surgeon General, U. S. Army; Dr. I. M. Moriyama, Public Health Service; Dr. Edward S. Rogers, School of Public Health, University of California (also Chairman A.P.H.A. Subcommittee for the Sixth Revision of International List of Causes of

Death); and Captain R. L. Ware, Bureau of Medicine and Surgery, Navy Department.

WISCONSIN PUBLIC HEALTH COUNCIL

On May 12, in Madison, Wis., a group of 45 persons calling itself "just a youngster," organized formally as the Wisconsin Public Health Council. The group was made up of 14 members at large and representative of 25 organizations—professional societies, farm and labor groups, voluntary health agencies, women's groups, and others.

It discussed the purposes of the new organization, the type of membership and program suited to the purposes, selected a constitution and nominating committees, named itself, and heard from Carl Neupert, M.D., State Health Officer, Allan Filek, M.D., Director of Local Health Administration in the State Department of Health, and Carl E. Buck, Dr.P.H., of the Michigan University School of Public Health.

At a second meeting on July 15, a constitution and by-laws were adopted and the following officers elected:

President—Richard Bardwell, Madison

1st Vice-President—William J. Deegan, Superior

2nd Vice-President—Mrs. Oliver Plantinga, Rothschild

Treasurer—Mrs. A. W. Hammond, Beaver Dam

Gertrude Clouse, Consultant Nurse of the State Health Department, has been released to serve as full-time Secretary of the Council.

Committees on membership, program, constitution and by-laws, publications and education, and public relations were appointed. One of the early programs being planned is the development of community health councils in many areas of the state.

The constitution provides for a broad membership representing all citizen interests. The Council is not an official arm of the State Health De-

partment or any other branch of the Wisconsin government.

Carl N. Neupert, M.D., State Health Officer, addressed the July 15 group on "The Most Urgent Public Health Needs in Wisconsin." He pointed out the lack of local full-time health services in large parts of the state, the need for citizen support of the health department's planning in this field, and the importance of supporting the federal Public Health Services Bill of 1948, which would provide federal grants-in-aid for general community health services, and the need for consolidating some 2,000 health jurisdictions in the state into a few large units with populations of at least 50,000.

NEWS IN THE NEW YORK CITY HEALTH DEPARTMENT

Harry S. Mustard, M.D., on leave from the directorship of the Columbia University School of Public Health, became Health Commissioner of New York City's 8,000,000 people nearly a year ago. He has now announced a number of developments.

One is the reorganization of the 19 different units of the department into 5 major divisions, with 2 headed by deputy commissioners. The 5 divisions and the commissioners heading them, all of whom are career men in the department, are:

Community Health Services—Deputy Commissioner, Samuel Frant, M.D.

Administrative Division—Deputy Commissioner, Matthew A. Byrne

Preventable Diseases and Adult Hygiene Services—Assistant Commissioner, Ralph S. Muckenfuss, M.D.

Maternal and Child Health Services—Assistant Commissioner, Leona Baumgartner, M.D.

Environmental Sanitation Services—Assistant Commissioner, Jerome Trichter

Dr. Frant, who has been with the department since 1923, most recently as Director of the Bureau of Preventable Diseases and Deputy Commissioner, will also serve as Commissioner during the

latter's absence. He will coordinate the activities of the various divisions and assign professional personnel, in addition to heading his own Division of Community Health Services which includes District Health Administration, Public Health Nursing, Nutrition, and Public Health Education.

Dr. Muckenfuss has been with the department since 1935, since 1937 as Director of the Bureau of Laboratories. As Assistant Commissioner he will supervise not only the Bureau of Laboratories, but those of Preventable Diseases, Tuberculosis, Social Hygiene, and Adult Hygiene.

Dr. Baumgartner has been Director of the Bureau of Child Hygiene since 1941, having first joined the department in 1937. She will direct the work of 4 bureaus: Mothers and Young Children, Physically Handicapped Children, Dentistry, and School Health.

Mr. Trichter has been Director of the department's Bureau of Food and Drugs since 1939, and first joined the department in 1930. He will be in charge of 2 bureaus: Food and Drugs and Sanitary Engineering.

Coincident with this reorganization, details were announced of plans for a new diagnostic and periodic health examination service. A first "pilot clinic" is in the planning stage, to be opened in the near future. The diagnostic service will be open to patients referred by their private physicians to whom they will be referred back for treatment. The periodic health examination service will be for persons referred by private physicians and persons from groups selected for such study by the department.

In announcing this service, Dr. Mustard pointed out that the department has already had a long tradition of making diagnostic services available to private physicians, chest x-rays, tropical disease and venereal disease ser-
vices, laboratory services and diagnostic

services in communicable diseases, the latter two having been provided for half a century. Said Dr. Mustard further, "The new diagnostic service program is being put into operation because, as medical knowledge has progressed, specialized information, skills, and equipment have become increasingly necessary if patients are to receive the full benefits of modern medicine. These things are expensive. Too frequently when the private physician orders specialized examinations, x-rays, and tests, the family of ordinary means is unable to obtain them because of the cost."

INTERNATIONAL POLIOMYELITIS CONFERENCE TO HAVE PERMANENT STATUS

At the final session of the International Poliomyelitis Conference in New York on July 17, an Organization Committee was created to form a permanent body for a global study of poliomyelitis. This committee of 15 is made up of the President and Medical Director of the National Foundation for Infantile Paralysis, the 7 members of the Advisory Committee of the International Conference, its Executive Secretary, and representatives of 5 nations other than the United States.

The committee list follows:

Irvin Abell, M.D., Clinical Professor Emeritus of Surgery, University of Louisville, Louisville, Ky.

Fritz Buchthal, M.D., Director, Institute of Neurophysiology, University of Copenhagen, Denmark

Oswaldo P. Campos, M.D., Hospital Jesus, Rio de Janeiro, Brazil

Morris Fishbein, M.D., Editor of *The Journal of the American Medical Association*, Chicago, Ill.

Stanley E. Henwood, Executive Secretary, First International Poliomyelitis Conference

David Lloyd, Ph.D., Associate Member of the Rockefeller Institute for Medical Research, New York, N. Y.

Kenneth Maxcy, M.D., Professor of Epidemiology, The Johns Hopkins University, Baltimore, Md.

Rustin McIntosh, M.D., Professor of Pediatrics, Columbia University, New York, N. Y.

Frank Ober, M.D., Professor Emeritus of Orthopedic Surgery, Harvard University, Boston, Mass.

Basil O'Connor, President, The National Foundation for Infantile Paralysis.

Thomas Rivers, M.D., Director of The Hospital of the Rockefeller Institute for Medical Research, New York, N. Y.

Hernan Romero, M.D., Professor, Hygiene and Preventive Medicine, University of Chile, Santiago

Professor Herbert J. Seddon, Medical Director, Wingfield-Morris Orthopaedic Hospital, Oxford, England

Professor Dr. S. Van Creveld, of Pediatric Clinic, University of Amsterdam, The Netherlands

Hart E. Van Riper, M.D., Medical Director, The National Foundation for Infantile Paralysis

The Executive Committee of this group is made up of Drs. Fishbein, Maxcy, McIntosh, Rivers, and Van Riper.

The resolution creating the Organization Committee empowers it to adopt by-laws for the international congress, secure a charter under the laws of New York State, and fix the place and date of the first formal international congress to be held in 1951.

IS THIS A TREND?

The Hartford (Conn.) Health Department is developing a medical-social service with headquarters in its clinic building. Financed for the first year by the Hartford Foundation for Public Giving, its purpose is to assist patients and their families with social problems incident to their illness. In addition to working closely with other health department bureaus, the service accepts referrals from other city departments, social agencies, industrial nurses and physicians, and the patient himself or his family. Service to private physicians is of two types: (a) Consultative services giving information about sources of help either to the physician or his patient; (b) Intensive service to

the patient including an interview by the staff worker.

The announcement further says, "Occasionally persons who reside outside of the city limits, if they cannot be cared for in any other way, may be referred by local agencies, doctors, and firms since many of the agencies with whom the social worker is in contact serve an area larger than the city."

The Director of the new service is Barbara A. Wells, graduate of the Simmons College School of Social Work, and formerly with the Hartford Hospital, the Greater Hartford Community Council, and the American Red Cross Overseas Service.

COLLEGE SORORITIES HELP CEREBRAL PALSID

The National Society for Crippled Children and Adults has awarded scholarships to 8 persons for specialized training in cerebral palsy. This program is made possible by a national women's college sorority, Alpha Chi Omega, which has adopted help to the cerebral palsied as its major national service project. It has made available to the National Society for Crippled annually for 6 years, \$5,000 to support the program of cerebral palsied training scholarships. The first 8 scholarships went to 4 physical therapists and 4 physicians.

Simultaneous with this news is the further announcement that another national women's sorority, Zeta Tau Alpha, at its recent Golden Anniversary Convention, made a grant of \$10,000 to the National Society for compiling and publishing an equipment brochure for the treatment of palsied children. This is in addition to an initial grant of \$2,500 the previous year for preliminary work on the brochure.

CONTROL OF LEAD EXPOSURE

Three aspects of the control of lead exposure are presented in a 21 page

pamphlet published by the Lead Industries Association. They are: "A Medical View of the Lead Problem," by William C. Wilentz, M.D., Medical Director of the Perth Amboy plant of the National Lead Company; "Medical and Hygiene Aspects of Plant Lead Control," by Lloyd E. Hamlin, M.D., Medical Director, American Brake Shoe Company; and "Lead Hygiene in the Plant—The Industrial Hygiene Aspect," by Herbert J. Weber, Industrial Hygienist, also, of the American Brake Shoe Company. Lead Industries Association, 420 Lexington Avenue, New York 17, N. Y., 50 cents.

MANUAL OF SAFETY IN SANDBLASTING

The Industrial Hygiene Foundation of America, Inc., has prepared for the National Industrial Sand Association a manual entitled *Safety in Sandblasting*. The manual offers helpful hints concerning sandblasting operations. It includes brief descriptions of the processes, equipment, points of safety, and protective equipment desirable in sandblasting operations. Available from the N.I.S.A., Washington, D. C., \$1.00.

WINTHROP-STEARN'S NAVY CITATION FOR WAR WORK

Award of a certificate of achievement to Winthrop-Stearns, Inc., manufacturer of pharmaceuticals, was made in New York on July 15 by the Surgeon General, U. S. Navy, in recognition of "meritorious and outstanding services rendered to the Navy's Medical Department during World War II." In presenting the certificate to Theodore G. Klumpp, M.D., President of Winthrop-Stearns, Rear Admiral A. H. Dearing, District Medical Officer, said in part, "exceptionally outstanding co-operation and assistance voluntarily rendered by your organization to the Materiel Division, Bureau of Medicine and Surgery, throughout the war period . . . were of inestimable value to the

Bureau, and enabled it to maintain at all times a high degree of proficiency in keeping a constant flow of essential material and equipment to the Medical Department in all parts of the world."

During the war Winthrop-Stearns produced antimalarials and other drugs used in the treatment of such tropical diseases as African sleeping sickness, kala-azar, filariasis, and schistosomiasis. The firm discovered a method of producing atabrine on a commercial scale early in the war, and developed aralen, an antimalarial considered more potent than atabrine or quinine by the National Research Council.

WATER POLLUTION BILL PASSED

The water pollution bill (S. 418) has been signed by the President. Its purpose is to establish a national program for eliminating or reducing pollution of interstate waters while at the same time recognizing and preserving the primary responsibilities and rights of the states in controlling water pollution. The U. S. Public Health Service is made responsible for the preparation of comprehensive programs plus specified regulatory activities. The bill authorizes the expenditure of \$1,000,000 a year for 5 years for grants to states to support investigations on ways to prevent and control pollution by industrial wastes; another \$1,000,000 a year for 5 years to assist public bodies in making needed studies preliminary to construction projects; and \$22,500,000 a year for 5 years as loans to help finance construction of necessary treatment works.

HOWARD M. KLINE TO HOOVER COMMISSION

Howard M. Kline, Ph.D., has been appointed Executive Secretary of the Medical and Hospital Services Committee of the Hoover Commission, which is studying reorganization of the United States Government's executive branch.

This committee, whose chairman is Tracy S. Voorhees, Under-Secretary of War, and President of Long Island College Hospital, Brooklyn, N. Y., has established an office in Washington with a full-time executive.

Dr. Kline has been Technical Secretary of the A.P.H.A. Subcommittee on Medical Care since its Washington office was established in 1946. He was on leave of absence in the spring of 1948 to serve as General Secretary of the National Health Assembly held in Washington in May.

Among recent appointments to the Medical and Hospital Services Committee is Hugh Leavell, M.D., Professor of Public Health, Harvard School of Public Health. Dr. Leavell was chairman of the controversial Medical Care Section of the National Health Assembly.

RESEARCH INSTITUTION IN NATIONAL INSTITUTES OF HEALTH

A new clinical research institution for the National Institutes of Health of the U. S. Public Health Service is now in the pre-construction stage and is expected to be ready for use by mid-summer of 1951. Bids were invited in July for this 13 story building that will have a floor space of approximately 1¼ million square feet.

It will house the National Institute of Mental Health, including 150 beds for neuropsychiatric patients, as well as the hospital facilities of the National Cancer Institute, National Heart Institute, and National Institute of Dental Research, and clinical services for the study of patients with infectious and tropical diseases.

Although the institution will contain 500 hospital beds and receive patients referred from all parts of the country, scientific laboratories will occupy two-thirds of the building. In one wing new products arising out of atomic energy researches and highly complex machines

will be used to treat certain types of tumors and to study body functions in health and disease.

Medical and psychiatric social service, physical and occupational therapy, and rehabilitation services will be provided in addition to the conventional services of a general hospital.

In announcing the details for the new Clinical Center in Bethesda, Md., R. E. Dyer, M.D., Director of the National Institutes of Health, said, "By an unusual combination of laboratory facilities to aid physicians in diagnosis and treatment, this Center will make possible a unified, planned attack upon some of our most baffling medical problems and will also assure patients of the very highest quality of medical care. Major emphasis will be placed on the predominant causes of death and disability in our nation today.

"The building is designed to enable physicians, chemists, physicists, bacteriologists, sociologists, psychologists, and other scientists to work in close collaboration. Using the team technique which has already produced notable research discoveries, they will be able to pursue every ramification of the diseases they study."

POSTGRADUATE SEMINARS AT COLORADO UNIVERSITY

The University of Colorado School of Medicine, at its Medical Center in Denver, will hold two short seminars on subjects of interest to public health physicians. One, in coöperation with the State Health Department on problems of new-born infants, both premature and full term, will be held October 14-16. Registration fee is \$10.

The second, on public health and preventive medicine, will be held October 18-21. It is designed to give the general practitioner, particularly in rural areas, the fundamentals of communicable disease control through sanitation,

immunization, and other procedures. Coöperating agencies are the Colorado State Medical Society, the Department of Public Health, and the U. S. Public Health Service.

Apply University of Colorado Medical Center, 4200 East 9th Avenue, Denver 7.

LOS ANGELES COUNTY HEALTH INDEX

The Los Angeles County Health Index for December 27, 1947, and July 10, 1948, contains interesting tabulations of tuberculosis statistics, which remind us that this disease causes 20 per cent of all deaths in the 30-40 age group; and that the potential years of life lost by those who died from tuberculosis in the United States in 1944 was 1,175,000, as compared with 1,287,245 from cancer and 1,929,953 from heart disease.

The second article calls attention to the marked excess of mortality among males as compared with mortality among females at the older age periods—a problem discussed in the August issue of this *Journal*.

REORGANIZATION FOR NEW JERSEY

On June 7, 1948, the Public Health Council of New Jersey unanimously approved a plan for the functional reorganization of the New Jersey State Department of Health presented by the new Commissioner, Daniel J. Bergsma, M.D.

Under this plan the activities of the department will be carried on through six main bureaus, each under the leadership of a director qualified for the specific responsibility involved. The bureaus are: Environmental Sanitation, Preventable Diseases, Laboratories, Local Health Services, Vital Statistics and Administration, and Constructive Health. The last named will be specifically responsible for the development of plans that can be applied locally to

increase the good health of the community. It will include the state department's activities in the field of nutrition, public health nursing, maternal and child health, adult health and health education.

MEDICAL ADVISORY COMMITTEE TO RESOURCES BOARD

The chairman of the National Security Resources Board, Arthur M. Hill, recently announced appointment of a Medical Advisory Committee to consult with the Board on security aspects of public health. The committee members are William P. Shepard, M.D., in charge of the Metropolitan Life Insurance Company's health and welfare activities in the western part of the United States; A. C. Bachmeyer, M.D., Director of the University Clinics and Hospital, University of Chicago; James C. Sargent, M.D., Chairman of a permanent council of the American Medical Association, set up to deal with problems of national emergency; Edward L. Bortz, M.D., Associate Professor of Medicine, University of Pennsylvania and recent President of the American Medical Association; Michael E. DeBakey, M.D., Assistant Professor of Surgery, Louisiana State University; and Percy T. Phillips, D.D.S., Secretary, New York Dental Society.

PERSONALS

E. J. ADE has been appointed Fund-Raising Director of the American Heart Association, New York City. Formerly associated with the John Price Jones Corporation, Mr. Ade has directed fund-raising activities for the Planned Parenthood Federation of America and the New York University-Bellevue Medical Center. JAMES R. AMOS, M.D.,† formerly Health Officer of Greene County,

Missouri, has become Medical Director of a regional blood donor service of the American Red Cross, covering 28 Missouri counties. With headquarters in Springfield, a "bloodmobile" will make regular visits to all communities within a 100 mile radius. This is said to be the second community in the Midwest and the first in Missouri to establish a regional blood service program.

JOSEPH C. ANDERSON, M.D., in March, was appointed District Medical Director for the Pennsylvania Department of Health in Cambria and Somerset Counties with headquarters in Ebensburg.

FRANK C. BAUER† has been appointed Chief of the newly organized Public Health Methods Division which will collect and analyze Chicago Health Department birth, death, and disease statistics. Mr. Bauer was Chief of the Import Statistics Section of the Bureau of the Census in Washington from 1942 through 1947.

W. A. BROWN, M.D., became City-County Director of Health of Evansville, Indiana. He was formerly Director of the Bureau of Communicable Diseases, Virginia Department of Health.

LEROY E. BURNEY, M.D.,* Indiana State Health Officer, recently received the 1948 Good Governmental Award of the Indiana Junior Chamber of Commerce, in the form of a glass plaque. This is given annually for the outstanding young man (under 35) of the year.

H. D. CROW, M.D.,† who has just completed the work for the degree of Master of Public Health at Johns Hopkins School of Public Health, Baltimore, Md., has been appointed Health Director of the Fredericksburg City-King George, and Stafford

* Fellow A.P.H.A.
† Member A.P.H.A.

Counties Health District in Virginia.

IRENE M. DONOVAN, R.N.,* Director of the Division of Public Health Nursing, North Dakota State Department of Health, since 1939, resigned her position with the Department effective August 1.

LYNDE FALES recently joined the staff of the Alaska Department of Health. She was previously employed in the Visual Aids Section of the U. S. Office of Education, Washington, D. C., and had also been with the Washington Office of the London Daily Express, the British Information Service in New York City, and the American Embassy in France.

BEN FISHER, M.D., Milwaukee, Wis., has been named the winner of University of Illinois Borden Undergraduate Award for 1948, a gift of \$500, for research in "Clinical Observations on the Prothrombin Test."

CHANGES IN FLORIDA HEALTH OFFICERS:

BURTON F. AUSTIN, M.D.,† is now Health Officer of the Palm Beach County Health Department with headquarters at West Palm Beach. Dr. Austin was formerly State Health Officer of Alabama and Regional Medical Director of the American Red Cross. The Assistant Health Officer is CHARLES G. CHAPLIN, M.D., formerly Health Officer of the Jefferson County Health Department.

JOSEPH H. BATSCHE, M.D., has been employed as Assistant Director at the Rapid Treatment Center at Melbourne.

G. L. BEAUMONT, M.D., of New Cumberland, W. Va., is now Health Officer of Highlands, Glades, and Hendry Counties, with headquarters at Sebring, succeeding E. W. HOLLINGSWORTH, M.D.

HOLLAND M. CARTER, M.D., of Smoaks, S. C., has been elected Health Officer of the Madison and Taylor County health unit with

headquarters at Madison. He succeeds ROBERT F. SAYRE, M.D., resigned.

RAYMOND J. DALTON, M.D.,† resigned as Health Officer of the Lake County Health Department, effective August 1.

JAMES W. FERRIS, M.D., formerly Health Officer of Putnam and Flagler Counties has been elected Health Officer of Hardee, DeSoto, and Charlotte Counties, with headquarters at Arcadia. He succeeds DANIEL H. ROWE, M.D., who has resigned to become House Officer at the Boston City Hospital, Boston, Mass.

ALBERT O. RYAN, M.D., has been appointed Assistant Health Officer to EDWIN G. RILEY, M.D.,† in the Polk County Health Department with headquarters in Bartow.

WILLIAM W. FRYE, M.D.,* has been appointed Professor of Tropical Medicine and Public Health and Assistant Director of the Division of Graduate Medicine, Tulane University, New Orleans, La. Since 1945 he has been Professor and Head of the Department of Preventive Medicine and Public Health, Vanderbilt University, Nashville, Tenn.

TINSLEY R. HARRISON, M.D., Professor of Medicine at Southwestern Medical College, Dallas, Tex., became President of the American Heart Association at its annual meeting in Chicago, June 18-19, succeeding ARLIE R. BARNES, M.D., Rochester, Minn. HAROLD M. MARVIN, M.D., New Haven, Conn., former Executive Secretary of the Association, was chosen President-Elect.

HENRIETTA HERBOLSHEIMER, M.D.,† has been appointed Medical Administrative Assistant to ROLAND R. CROSS, M.D.,† Director of the Illinois Department of Public Health. A member of the staff of the department for 7 years, she has been Chief

of the Division of Hospital Construction and Services for the past year, and earlier Chief of the Division of Maternal and Child Health. She has been succeeded as Chief of the Division of Hospital Construction and Services by GEORGE K. HENDRIX,† who has been in the Department since 1937, first in the Division of Sanitary Engineering and later in the Division of Hospital Construction and Services.

HAZEL HIGBEE,† former Professor of Public Health Nursing at the Medical College of Virginia, has succeeded MARY I. MASTIN* as Director of the Bureau of Public Health Nursing, Virginia Department of Health, Richmond.

JOHN P. HUBBARD, M.D.,† has been appointed Assistant Professor of Pediatrics at the University of Pennsylvania, School of Medicine, where he will direct a rheumatic fever teaching program throughout Pennsylvania under the auspices of the State Health Department. He will simultaneously direct a nation-wide program of the American Academy of Pediatrics for the improvement of child health from offices in the hospital. He has been directing a study of child health services for the Academy.

BURTON K. KILBOURNE, M.D.,* was recently reelected for a two year term as Secretary and Executive Officer of the Montana State Board of Health, Helena.

JOHN H. KLOPP, M.D.,† has been appointed State Medical Director of Delaware County, Pennsylvania. He will supervise local health programs, control of communicable diseases, and health activities in fourth class school districts.

DAVID B. LEE,* Chief Sanitary Engineer, Florida State Board of Health, Jacksonville, recently received the Kenneth Allen Award for outstanding

service to the state and national Sewage Works Associations. The award is presented every 3 years by the state chapter of the Federation of Sewage Works Association.

KATHARINE F. LENROOT,* Chief of the Children's Bureau of the U. S. Federal Security Agency, delivered the 1948 commencement address at Tulane University, New Orleans, which conferred upon her the honorary degree of Doctor of Laws. Three days earlier Russell Sage College, Troy, N. Y., conferred the honorary degree of Doctor of Humane Letters upon Miss Lenroot at its commencement on May 30.

ESTELLE MARKS,† who has been Acting Registrar for some time, was recently appointed Virginia Registrar of Vital Statistics, Richmond.

HARLAN P. McNUTT, M.D., M.P.H., who has just received the M.P.H. degree from Johns Hopkins School of Public Health, has been appointed Director of the Oregon State Board of Health's Mental Hygiene Section, effective August 1. He served as neuropsychiatrist with the U. S. Veterans' Administration in Portland in 1946-1947, and served in a similar capacity with the U. S. Army Medical Corps from 1944 to 1946.

ORLO MILLER† has been appointed to the newly established position of School Health Coördinator in the Wisconsin State Department of Public Instruction, Madison. Mr. Miller formerly worked on a state-wide school program of health and physical education in Indiana.

ROBERT R. MORGAN, M.D., has been appointed Associate Professor of Epidemiology at the School of Public Health, University of Michigan, Ann Arbor. Dr. Morgan has recently been working at the Thorndike

* Fellow A.P.H.A.

† Member A.P.H.A.

Memorial Laboratory in Boston as Senior Fellow in Virus Diseases, National Research Council, in investigations concerned with Salmonella and chemotherapy of virus infections.

ELDRED K. MUSSON, M.D.,* on July 15 began his duties as Peoria, Ill., City Health Officer. He was formerly Health Officer of Schoharie County, New York.

JOHN W. R. NORTON, M.D.,* was elected North Carolina State Health Officer by the State Board of Health. He succeeds CARL V. REYNOLDS,* retired June 30. Since 1940 Dr. Norton has been with the Tennessee Valley Authority at Chattanooga, Tenn. Previously he was Assistant Director of county health work and later Assistant Director of Preventive Medicine in the North Carolina State Health Department.

NETTIE PRICE, R.N., has accepted a position as Coördinator for County Hospitals and the County Health Department, Monongalia County, West Virginia. Coming most recently from the Brooklyn, N. Y., Visiting Nurse Association, Miss Price has a varied background of journalism, social work and statistical research, and public health nursing.

MORTON M. RAYMAN, M.D., has been appointed Chief of the Microbiological Branch of the Food Research Division, Quartermaster Food and Container Institute for the Armed Forces, Chicago. He will direct research concerning the nature and factors affecting the microbiological and histological changes which occur during the processing and storage of foods for the use of the Armed Forces.

PHYLLIS RING, R.N., public health nurse, has joined the staff of the Alaska Department of Health, Juneau, having previously been in the Minneapolis Community Health Service.

PHILIP C. RISSE, M.D., of Blackwell, Okla., has been appointed Medical Health Officer for the Olympia Peninsula Health District of Washington, including Clallam and Jefferson Counties and with headquarters in Port Angeles. He succeeds SHIRLEY BENHAM, JR., M.D.,† who has been appointed District Health Officer for the Kitsap County-City of Bremerton Health Department.

L. J. ROPER, M.D.,* was recently reappointed to a new 4 year term as Virginia Health Commissioner by GOVERNOR TUCK.

W. H. RUMBEL, D.D.S.,* is the new Director of the Division of Mouth Hygiene, Virginia Department of Health. He was most recently Director of the Bureau of Dental Hygiene, West Virginia Department of Health.

JAMES G. SHAFFER, D.Sc.,† Assistant Professor of Preventive Medicine and Public Health at Vanderbilt University School of Medicine, Nashville, Tenn., has resigned, effective July 1, to become Associate Professor of Bacteriology and Virology, and Associate in Preventive Medicine at the University of Louisville School of Medicine, Ky.

ROBERT E. SHANK, M.D.,† has been appointed Professor of Preventive Medicine and Public Health of the Department of Preventive Medicine and Public Health at the Washington University School of Medicine, St. Louis, Mo., effective July 1. Dr. Shank was previously with the William H. Park Laboratories in New York.

MARGARET T. SHAY, R.N., has been appointed Director of the Adelphi College School of Nursing, Garden City, N. Y. She was most recently Associate Professor of Nursing, Wayne University, Detroit, Mich.

* Fellow A.P.H.A.

† Member A.P.H.A.

JAMES W. SMITH has been named Director of the Virginia Health Department's new Division of Tourist Establishment Sanitation in the Bureau of Local Health Services. He has been in the Department of Health since 1921, most recently as Supervisor of Sanitation in the Richmond office.

JOSEPH EARL SNYDER, M.D., was recently named Director of Vanderbilt Clinic and Administrative Assistant in charge of Professional Services to Patients by the Executive Committee of the Board of Trustees of the Presbyterian Hospital, New York, N. Y.

SAMUEL D. STURKIE, M.D., M.P.H.,† has resigned as Health Officer of Lynchburg, Va., to become the Director of the Charlottesville-Albemarle County Health Department in the same state.

SIDNEY I. WOLFSON † has resigned as Health Officer of Dover, N. J., to accept the position of Public Health Administrator in the Montgomery County, Maryland, Health Department.

G. W. WYATT, D.D.S., has been named Director of the Bureau of Dental Health, West Virginia State Department of Health, Charleston, succeeding W. R. RUMBEL, D.D.S.,† resigned. Dr. Wyatt has been field clinician and later Assistant Director of the Division.

FRANKLIN D. YODER, M.D., M.P.H.,† has been appointed Director of the Wyoming State Department of Health, Cheyenne, effective August 1.

Deaths

TALIAFERRO CLARK, M.D., former Assistant Surgeon General of the U. S. Public Health Service, died July 4 in the U. S. Marine Hospital, Ellis Island, N. Y., at the age of 81. As Assistant Surgeon General, Dr. Clark

served as Chief of the Venereal Disease Division from 1930 to 1933.

RICHARD PEARSON STRONG, M.D., authority on tropical diseases and epidemics, died on July 4 at the age of 76. Dr. Strong's research took him to all parts of the world and he was decorated for his achievements by Britain, France, China, and Serbia. In 1946 he won the Legion of Merit for his work in World War II. The Theobald Smith medal of the American Academy of Tropical Medicine was bestowed on him in 1939. The first Richard Pearson Strong medal for distinguished achievement in tropical medicine was presented by the American Foundation for Tropical Medicine, February, 1944, to Dr. Strong for whom the medal was named.

Cultivating Our Human Resources for Health in Tomorrow's World*

MARTHA M. ELIOT, M.D., F.A.P.H.A.

Associate Chief, U. S. Children's Bureau, Washington, D. C.

I WANT to take this opportunity to express to you, the members of this Association, my appreciation of the honor that you have done me in making me your President for this past year. To have been so chosen by one's colleagues is the highest honor that could come to any of us here. That it should have come to me means much to me personally, but even more because of what it means in the terms of the concern of this Association for the better provision of medical care to the people and for the health of children in particular. I am happy that this concern has been expressing itself recently through the activities of our alert Committee on Medical Care which has taken the lead in the current discussions on the establishment of a new section on medical care and through the action of the Executive Board in setting up a new Committee on Child Health. Both of these actions broaden the horizons of the Association. They may well be reflected ultimately in great good to all our people. They help us take a long look ahead.

A few days ago my attention was called to a recently published book, *Our Plundered Planet*, by Fairfield Osborn, that opens as follows: "Yesterday morning more than 175,000 mothers looked down upon the vague uncomprehending eyes of their new-born babes. Today a similar number are doing likewise, and tomorrow and the next day. . . . These are the children of the earth, each day in every land they come, insistently in such numbers, the daily host reproducing the human species the world over. . . . So great a company of new-born children . . . become day after day a living part of the environment into which each of them has come. Its strength will be theirs, and its weaknesses." This, in a way, is the core of what I want to say tonight.

I have chosen as my subject on this occasion "Cultivating Our Human Resources for Health in Tomorrow's World." I have chosen it because it expresses the need for a dynamic approach to our problem of health, because it directs attention to the role of positive health in the lives of people, especially in the lives of children; because it implies that the growth of an idea, or a program of action, like the

* Presidential Address presented before the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

growth of a plant, an animal, or a child, calls for thoughtful, imaginative preparation, for careful fostering, for fertilization with the elements essential for its development. I have chosen this subject because it takes us beyond limits of our own national life and suggests that what we do for the health of our children and youth today will influence the whole world tomorrow.

We cannot, and I do not believe we want to, escape from the principles that underlie this concept. You will bear with me, I know, when I press upon you the urgency and the necessity of focusing national attention on action in behalf of children. I do this without apology, for the basic principles underlying our total health program are essentially the same whether we are considering children or the total population. I believe you will agree with me when I say that what we do for the child can be taken as a fair measure of social progress.

Most of us, I believe, are at last aware that we are living in a period of great change; in a new age growing out of man's great skill in discovering facts about the physical and biological world and his ingenuity in applying them. We cannot escape from the fact that knowledge in this realm has surged far ahead of our knowledge in the social sciences, far ahead of our knowledge of the nature of man, himself. Mankind finds itself with many tools that may be used constructively or destructively for the welfare of man. Enormous benefits to our health, to our social and economic status have accrued or may accrue. So too out of scientific advance may come our destruction. What we have failed to grasp is that the use to which these tools may be put by man will be determined by his social philosophy, by his emotional reactions and behavior, and that it is to a large extent a matter of human relations.

The situation in which we find ourselves is full of confusions rising out of a multitude of ideas and opinions and too little and too poorly disseminated knowledge of why we believe as we do. One thing is clear. We must increase still more our knowledge in this field of human relations—and having increased it, we must transmit it, we must use it; channels for its communication must be opened and free flowing. We must produce a whole new generation of young people—people who are free to explore and to learn, to base action on knowledge, to weigh, understand, and interpret human behavior, to find ways of overcoming the aggressive attitudes and actions growing out of our culture, and the unreasoned fears built into us in our childhood, ways of living harmoniously together.

Man has shown that he can build a Tennessee Valley Authority. He can dam up the headwaters of a great river to control floods; he can free and use the waters to produce power. He can irrigate the dry lands. He can bring health and economic prosperity to a vast number of people. He has learned that he must stop erosion of the soil and the destruction of forests back of the dams if the individual farm is to prosper, if water is to be kept in the soil, and if the headwaters back in the hills are to grow in size and strength to form the pools of power above the dams. He has learned that if the land is to be productive he must nurture it, he must tend it carefully and wisely, he must fertilize it.

So must our health programs develop from cultivation at the grass roots. Upon the nurture we give to local health activities will depend the vigor of our state and national health services. Upon the nurture we give to man in his infancy and early childhood, upon the opportunities and guidance we give him in his adolescence and youth, upon the strength we develop in the relation-

ship of parent to infant, parent to child, child to child will depend to a great extent what man will be like when he comes to maturity. In a very real sense the child is the touchstone. What we do for him we do for all mankind; what we do for adults, we also do for children.

So far, however our advances in improving health have come mostly through the flow of new knowledge from the laboratories of the physical and biological sciences; less from the social sciences. A substantial start has been made in relating the physical health of individuals to social factors, in cultivating the human resources for health—what Richard Cabot called the social component of medicine—as well as those of the physical environment. The roots of our knowledge spread out in many directions and go back to such great men as Charles Darwin, Edwin Chadwick, Abraham Jacobi, William James, Adolf Meyer, Sigmund Freud, and many others. Many of us are aware of the relationship between the somatic and the psychological components of illness, and a variety of approaches to the study of this relationship are being explored. The public is growing more and more aware of the cost of mental disease in terms of human happiness and productiveness.

During the past half century we have acquired a vast body of knowledge on how to assure good nutrition and normal physical growth of children and to control communicable diseases. Gradually this knowledge has been made a part of the everyday existence of the everyday parent. It is true that we have an ever increasing understanding of the emotional life of man and of why children grow to maturity with behavior patterns that bring about individual and group conflicts. But we are only on the threshold of knowing how to incorporate our newer knowledge of dynamic psychology into

the lives of our citizens. Fortunately there is a ground swell of demand among parents for information and help on how behavior difficulties in children can be avoided, and how they and their children can be helped to understand and overcome such difficulties when they arise. Parents are aware that they need to understand more fully the elements that go into child rearing, the emotional factors as well as the physical, and the influence that their own life experiences may have on the way their children's development takes place and emotional maturity is reached.

We are all aware of these stirrings, and yet, at the same time, we are overwhelmed by the size of the task and perhaps discouraged that, even in a land of abundance such as ours, advances in making adequate health services and good medical care available to all the people come so slowly. We know that children still die or are sick or handicapped needlessly; that boys and girls still reach adolescence and maturity insecure in their individual, family, and community relationships; that they compensate for this insecurity by an abnormal degree of aggressiveness leading to overt asocial behavior, delinquency, or retreat within themselves. We know mothers still die in childbirth because expert care is not available. We know men and women still succumb to diseases or conditions that could be prevented or controlled. We know that one child in twenty will need care in a mental institution sometime during his life. Perhaps most important of all, we know that we have not yet learned how to persuade society that our medical knowledge and skills must be put to work for the benefit of all the people. We like to believe that our standard of living is high enough to provide not only food, shelter, clothing, education, recreation for families, but also

health and medical care, but when we look at the statistics, using children as a measure of social progress, we find that this is not the case.

Children are concentrated in low-income families; two-thirds live in families with total family incomes under \$3,500. They are concentrated in low-income states; about one-fourth of our children are found in the southeastern states that have but 12 per cent of the national income. Farm families have nearly one-third of our children, but only about 11 per cent of our income.

These facts make it obvious that many families with children cannot afford to pay for medical care, or when they do afford it, they do so at the expense of other essential items. Even comparatively well-to-do families, those with an income of \$5,000, would have difficulty meeting the costs of prolonged or serious illness. Yet today nearly 80 per cent of our families have less than \$5,000 income.

I see no way out of this dilemma except by finding some way of pooling funds to meet all the costs of care. For our public health programs we already do this through the device of collecting taxes. Eventually, we must use this device in some form to provide a medical care program for all our people.

Because our children's needs are urgent, I believe that it is a public responsibility to see that all services and facilities necessary to meet these needs are made available as rapidly as possible. The only way we can be sure of doing this is through a public program, one that does not involve a "means test," one that is as freely available to mothers and children as is our public education system.

Recently at the National Health Assembly, we took stock of our national health; we assessed our progress during recent years and projected a plan of action for the ten years ahead. The proposals made in the Federal Security

Administrator's report to the President include planning and action in every phase of the total health and medical service, whether by public or voluntary agency, by individual or group effort, by private practitioner or public health service. The action proposed is in the main concrete and within the realm of accomplishment in a decade. Throughout the report there is a core of concern and interest that prevention be emphasized, that human needs be served, that the healthy development of the child, including his ability to live harmoniously with his fellows, be given high priority. The proposals are based upon the premise that cultivation of our human resources is required; not just the conservation of them. We must renew the soil from which our citizens spring, look to the contours of the land producing them, plough in new patterns to stop the erosion of human strength and stability, and provide the fertilizers necessary to assure both quality and quantity in the production of the new generation.

Few would deny that our children are our most valuable resource—for on what we do for them today depends the future of our national life, the future of our world life. This is a truism that should scarcely need to be stated, so one would think. But we must state and restate it again and again. Children must become the focus of our everyday thought, of our economic and social planning, and of our domestic and foreign policy. As Grace Abbott once put it: "Children are our seed corn."

As we view the new age in which we live, and face the imperative need to start now on the task of fitting a new generation of children and youth to take their places as citizens in a peaceful world civilization, the old ideas take on new and urgent and profound meaning.

In his new book, *The Proper Study*

of *Mankind*, Stuart Chase points out that "it takes only twelve to fifteen years to train a new-born child to be at home in his parents' culture or any other into which he is accepted. Less than a generation would be enough to train *all the children of the world* to be citizens of the world." Obviously, as Mr. Chase himself recognizes, there would be many practical obstacles to accomplishing this so rapidly. But the ground must be cultivated for a new harvest in terms of mental health as well as physical health for the peoples of the world. At Geneva last July the World Health Organization in a resolution adopted by 54 nations put it in these terms: "The children of today represent the whole future of humanity. Maternal and child health is a problem of primary importance."

In 1934, Homer Folks, in addressing the National Conference on Economic Security, pointed out that the welfare of children—and he used the term welfare in the broadest sense—had been and must continue to be "the spearhead of social security." The history of social progress shows this to be true. It is a matter of record that many advances in the fields of medicine, public health, public welfare, education, and social security, have had their roots in the concern of parents and teachers and professional workers for the health and welfare of children. One can cite, for example, the campaign to reduce infant mortality gave impetus to public health measures to provide a pure milk supply; the early infant welfare stations were the beginnings of our modern ideas about individual health examinations and personal health conservation services; or the emergence of community health education programs from programs of health education in the schools.

In terms of our federal-state coöperative action directed toward the expansion of services to individuals

through grants-in-aid in the health, medical care, or general welfare fields, the states and the nation have frequently led off with programs in behalf of children. Here one may cite the Maternity and Infancy Act of 1921, the program for medical care of crippled children in 1935, the child welfare services program in 1935, the Emergency Maternity and Infant Care Program in 1943. Each of these pioneered in new areas. Their great value lay in the fact that they broke new ground for expanding federal-state programs in health and medical care for adults as well as for children. So, too, in the field of fair labor practices. Public interest was first expressed in an Act of Congress in 1916 providing for the regulation of the employment of children through the control of interstate commerce. Although it was declared unconstitutional by the Supreme Court within a year, this law paved the way for a much broader act of Congress, the Fair Labor Practices Act of 1938, based on the same principle but applied to the employment of adults as well as children. The great programs of public assistance for aid to the aged, to dependent children, to the blind, provided for under the Social Security Act, had their origin in the early mothers' or widows' pension programs developed by the states, primarily to benefit children.

I have looked back through the sweep of our history merely to show the usefulness and the strength of approaching problems requiring public action through first providing for children. By so doing, we can tackle health problems in an age group where prevention of disease, both physical and mental, has the greatest possibilities and brings the greatest rewards in terms of human well-being and happiness, length of life, and improvement in economic status. In this new age in which we find ourselves it would seem im-

perative that this approach be continued, that top priority be given to every phase of our national program that has potentialities for saving the lives or improving the total well-being of our children.

This means establishing priorities in developing our economic and social legislation in terms of its effect on child life. It means that we must test against this standard, not only the measures we take in behalf of children, but also measures for social insurance; measures for the control of employment practices; measures affecting the production and distribution of food, clothing, housing; measures for general health service and medical care; measures to extend and strengthen our educational system, including professional and adult education; measures to enhance the development and protection of our social institutions of freedom and justice. It means bringing together the various groups of citizens and agencies concerned with children for the exchange and stimulation of ideas, for better understanding of the effect on children of various public movements, for the development of programs of investigation and action that will directly or indirectly affect child life.

I do not have to say to you that child health workers have much to gain by doing this; that they can strengthen their hands immeasurably by associating themselves with workers in the welfare, education, housing, recreation, and other fields of social action; nor do I need to impress on you the value of support from citizens' groups. The broadening of the health worker's horizon of interest and improved service to children are the rewards of such joint effort.

There are some parts of the maternal and child health program that we know how to do fairly well, but we are not doing them well enough nor

extensively enough. Here we need to use power tractors rather than one-horse plowshares in turning new ground. I refer specifically to the basic preventive program in which the physician and the nurse advise the mother, either in the physician's office, in the health center, school or clinic, or at home, about the health and general care of herself, her baby, and her children. Hundreds of thousands of parents still do not have this help; tens of thousands who have some help are getting poor help; few parents get the best help we know how to give, including pediatric, nursing, dental, nutrition, and social advice; very few receive the kind of mental health advice that pediatric workers trained in child development are equipped to give.

For this basic service we need more and better trained physicians and dentists; more and better trained nurses, nutritionists, social workers, and other auxiliary workers; better equipped, better staffed, and more maternity and child health clinics where families can receive advice on mental as well as physical health; a greatly expanded health service for children of school age, including those in nursery and high schools, a service in which health and education authorities must join forces to see that the total job is done.

This basic maternal and child health program must be the instrument of local health departments if all children are to be served. It is therefore self-evident that such local health departments must completely cover our country and serve people wherever they live. No health legislation today is more important than that which will provide this administrative machinery. A bill that would do this, entitled "Local Public Health Services Act of 1948," was introduced into Congress during the last session. This bill departed from the concept, previously held by many, that responsibility for local health services must rest on the

local community first and be supported by the state and federal government as the local community failed or was unable to meet its responsibility. Under this bill federal responsibility for health programs is not residual. The total responsibility is shared by the local, state, and federal governments.

Basic maternal and child health services, however, are not enough. Many additional services are urgently needed. Mothers must have complete and adequate maternity care available to them everywhere. Infants, especially those prematurely born, all preschool children, and children of school age through adolescence must have freely available to them, wherever they live, not only preventive health services, mental as well as physical, but also all necessary care when they are sick, and child guidance and psychiatric service when required. Unless we have these services, we cannot produce a generation of young people who are fully mature and healthy in body and mind, who are emotionally secure and able to give more than is asked for, to face success and frustration with equanimity, to be self-reliant, to cooperate with their fellows, to take their place in a democratic society as thoughtful, responsible citizens concerned with the common good, and to "live harmoniously in a total changing environment." This is the kind of harvest for which we must now cultivate our soil and husband our resources.

Of course, the job of extending and improving the maternal and child health program cannot be done all at once if it is to be well done. But we can get started. There are some things we could do now, immediately, if funds were available! We could rapidly expand a wide variety of the special demonstration projects through which the states have been developing or applying new methods and procedures for providing complete preventive and

treatment services to children. The wartime EMIC program was such a demonstration. The whole crippled children's service is still another example of this type of special program where the harvest in better methods of administration and procedures in rendering care has been rich. Within our present crippled children's program there are still many special problems to solve—problems in which methods and procedures must be adapted and new ones developed. Particularly we must renew our efforts to expand and improve the special programs for children with rheumatic fever, cerebral palsy, epilepsy, hearing and vision impairments. Our experience clearly shows that a multiprofessional approach to these problems is a necessity.

Certainly equally important, perhaps even more important, is the need to develop demonstration projects for complete and adequate health and medical service for the "run-of-the-mine" children of preschool and school age. This is the only way that states and communities that do not now have the complete services they need for children may discover on the basis of their own experience how these needs can be met most effectively. In all of these programs for children there must be close cooperation between the health agency and the individual or agencies in the community who render or provide medical care, whether under public or private auspices.

I do not have to tell this Association that fundamental to the expansion of any health program—and child health is no exception—is the problem of recruitment and training of the professional and technical personnel. This is a crucial issue today. In the field of child health, particular attention must be given to the dynamic psychology as well as the physiology of child development in both in-service and postgraduate training and in the basic educational programs for physicians, nurses, den-

tists, social workers, and, indeed, all auxiliary personnel.

Before I leave the subject of providing for the particular needs of children, I must point out that without an underlying structure of research and investigation into all matters related to the welfare of children and child life from which new facts will flow, the service programs will sooner or later deteriorate and fail. Medical and related biological research in the past few decades have produced facts and information that led to dramatic reductions in maternal, infant, and childhood death rates, and in sickness rates. Undoubtedly this type of research will go on. The results of the work are easily understood because they so directly affect the health of the man-in-the-street and his family. Legislative support comes relatively easily.

But there is less public and, indeed, less professional understanding when it comes to research that has to do with learning more about the causes and roots of juvenile delinquency; the effect of certain cultural patterns on child and adult behavior; the effect of artificial feeding of infants or the separation of mother and new-born infant in the hospital on the parent-baby relationship and the emotional development of the child; the pathology, physiology, treatment and education of the cerebral-palsied child; or a multitude of other problems in child life that call for inquiry by a team of research workers seeking information in the field of the social as well as the biological sciences.

Research workers in a number of fields are now calling for legislation that would make possible such multidiscipline research in child life—legislation that would provide grants-in-aid to universities and child research institutes to carry out long-term as well as short-term projects. Although basic research is needed in these fundamental social and biological sciences, carefully

planned "operational" research that explores the success or failure of our methods of applying basic knowledge in child health and child welfare operating programs is also important. The proposals under discussion by these scientists would call for a National Child Research Institute which would serve as a clearinghouse for information on current research and provide a channel for the development of types of research that cannot be undertaken by any one university or research center alone, types of research that require national planning and action.

As I warned you I would, I have focused on the need for cultivating our resources for health by concentrating our attention on action for the nation's children, action that will help to fit them for citizenship in tomorrow's world. The world of adventure and life for our children and youth is not limited by the geographic borders of a town, as it was in 1645; or of a colony, as in 1745, or of a state, as in 1845, or even of the nation, as it was in 1945. Plans for action in behalf of our own children must take into consideration the total world community in which our children will grow up and live. Unlike us, they will have contacts and working relations with all kinds of people all over the world. Our 45 million children will have to take their place with the world's 700 million children.

To this end the First World Health Assembly of the World Health Organization, meeting in Geneva last July, placed maternal and child health in the top priority list of subjects to be given attention, and made funds available to start a program of service to the member nations. All the peoples of the earth crave health. The World Health Organization has the great task of interpreting to the peoples of the world that health means "mental and social well-being as well as physical health"; that it is "not merely the absence of disease

and infirmity"; and that the healthy development of the child is essential to harmonious living among peoples.

Today we are living at the beginning of a new age—an age brought about by the discovery of atomic energy, an age with potentialities and complexities which baffle and confuse and stagger the minds of ordinary men and women. We cannot as yet grasp what it means and, as usual, we are afraid of the unknown. Those of us who work in the fields of health and social welfare and education hopefully believe that we have a job to do which may in time alter the course of history, indeed which may make "history" possible. Our task is a difficult one for it involves changing attitudes of people, helping young people acquire the emotional maturity and the sense of responsibility requisite to living in a world of many nations with diverse ideologies and different cultural and social backgrounds. If we use—and implement—the definition of health set forth in the Constitution of the World Health Organization that I have already quoted to you, it becomes clear that this is a health task. It is a task that every one of us, no matter what his professional training, can work on in his usual daily round.

But accomplishments in this field represent a long haul, a haul that will be

productive only if we are given time, only if we have the imagination, the initiative, the intelligence, and the resources to push ahead with all possible speed.

As we view the critical world situation, we become frantically aware that unless, as Toynbee puts it, we give ourselves "time for peace," unless we find ways for nations to work together and break away from war as a means of settling differences, unless we gain now "the anticipatory wisdom" necessary to avoid world catastrophe, we will have no opportunity for our long haul task.

Our task is twofold then—first to work to gain "time for peace," and second to go about our daily jobs with the conviction that we can lose no time in reaching our full objectives for health for all the people, but with special concentration on the health of the oncoming generation. Our children are indeed our measure of social progress.

As I have been preparing this address, the words of one of our great American poets have echoed and reechoed through my mind. Perhaps they epitomize the challenge of our times. Walt Whitman, when sending a copy of *Leaves of Grass* to Emerson wrote, "Master, I am a man of perfect faith. We have not come through centuries . . . to halt in this land of ours."

tists, social workers, and, indeed, all auxiliary personnel.

Before I leave the subject of providing for the particular needs of children, I must point out that without an underlying structure of research and investigation into all matters related to the welfare of children and child life from which new facts will flow, the service programs will sooner or later deteriorate and fail. As I have been preparing this address, the words of one of our great American poets have echoed and reechoed through my mind. Perhaps they epitomize the challenge of our times. Walt Whitman, when sending a copy of *Leaves of Grass* to Emerson wrote, "Master, I am a man of perfect faith. We have not come through centuries . . . to halt in this land of ours."

The Ailments of Health Departments*

FLORENCE R. SABIN, M.D., F.A.P.H.A.

*Committee on Health, Governor's Post-war Planning Commission, Denver, Colo.;
President, Western Branch, A.P.H.A.*

AT the beginning of his address of last year Dr. Karl F. Meyer expressed his longing for a new definition of health. He was prophetic, for such a definition has now been given to us by the World Health Organization in what Dr. Chisholm, the Canadian psychiatrist, has called the most clearly defined word in the English language: "Health is the condition of physical, mental, and social well-being and not the mere absence of disease or infirmity."

We are met here to consider the health problems common to the western area of our country, but I shall have to take a backward step and consider not health at all, but ask your attention to two chronic ailments that still afflict health departments themselves no matter how progressive they may be. I speak of the chronic lack of funds and of the still worse lack of trained personnel.

It is my opinion that in the appeal for funds from legislatures and city governments, we have nowhere stressed sufficiently the fact that preventive medicine is economically sound. I speak from the standpoint of our two legislative failures in Colorado in 1947 in a session of the legislature conspicuously in favor of health measures. These two failures were to set up preventive measures against brucellosis in our dairy herds, and to provide hospital beds for our excess of tuberculous patients.

It is certainly not difficult to show

that the elimination of Bang's disease from dairy herds would increase the per capita wealth of any dairy state. You all remember the studies made in Michigan by Dr. Huddleson last year and reported in an editorial of the *Journal of the American Medical Association*, July 5, 1947, which stated that inasmuch as an infected cow produced 2,065 less lbs. of milk per lactation period than the non-infected cow, the State of Michigan lost 222,904,000 pounds of market milk per year from the prevalence of this disease. The loss was enough to supply about half a million persons a year with milk; the loss in butter was enough to supply about 600,000 persons. As if this were not a sufficient deficit of real wealth, the loss in calves represented a loss of 1,299,200 lbs. of veal or of 6,494,000 lbs. of beef, or of a proportionate annual loss in dairy products if the calves were raised as milk-producing animals.

Try to imagine these losses of real wealth reported for one dairy state, if computed on a national level, with the number of dairy cows and the percentage of infection used as the basic data. The data on losses is so impressive that it has not been too difficult a task to convince the dairy industry that preventive measures pay in terms of increased dividends.

I wish to have the health forces make more and more use of such data, to convince the business world that we are not just "do-gooders" used as a term of opprobrium, but that preventive

* Presidential address delivered at the meeting of the Western Branch A.P.H.A., Salt Lake City, Utah, May 25-27, 1948.

medicine is interested in increasing the per capita wealth of the community, as well as increasing the well-being of all the people.

Why did our bill, aimed at quarantining infected dairy cows only, fail even with the backing of the dairy industry? The answer is that the bill was killed in the livestock committee; however, defeat is often the first step toward improvement, and we are now convinced that the livestock industry is ready to assume leadership in this problem.

Here is a true western problem: the whole territory just east of the Rockies—Texas, New Mexico, Colorado, and Wyoming—is traditionally a country where "cattle is king," representing an industry of great national importance.

While the dairy industry in Colorado is worth about \$40,000,000, the cattle industry is worth \$113,000,000. No wonder that with all the glamour of their historical traditions and with their present real national importance, they are a controlling factor in the West in measures that affect their industry. Under these conditions, why did the saving of calves lost by a reasonably preventable disease seem of less significance to the cattle industry than to the dairy industry? I suspect that in Colorado, at least, the reason is that a greater difficulty and a more immediate concern to them was the shortage of grazing land. Shrinking of grazing land has a long, long history in the West.

At present, the Governor of Colorado has appointed a special committee with representatives of the livestock industry, of the dairy groups, of veterinarians, of the public health forces, and of the public to make a special study of the best possible control measures for this disease, with the next legislature in mind.

Instead of appointing the individual members to this committee, Governor Knous asked the different groups to

designate their own representatives. This state-wide committee has drawn up a bill of which I quote the section on the "Control and Eradication Program": "In an effort to control and eradicate Brucellosis in the State of Colorado, the Commissioner (Livestock Commissioner) is hereby directed to inaugurate and continue a program for such control and eradication throughout the State, by the vaccination of all heifer calves and the testing of all dairy cattle as hereinafter provided." The committee also authorized the appointment of a small committee to carry on an intensive educational program up to the time of the next legislative session.

I bring this matter before you not to stress the provisions of our particular bill, but—since no state can solve this problem alone—to suggest that it would be good policy for our western states to attack this problem at the same time.

What is our status with respect to tuberculosis in the Western Branch? I lack the data from Hawaii, the Philippines, and from British Columbia, but the records from Alaska are perhaps our very worst. Of the eleven western states, the records of 1945 showed three—Nevada, Arizona, and New Mexico—in the group of the highest death rates (43.6 to 123.1 per hundred thousand), and three—California, Montana, and Colorado—in the next worst group (37.3 to 43.5).

Why should Colorado, surrounded by Utah, Wyoming, Nebraska, and Kansas—all with the lowest rates—have such a record? Analyzing the state records, it is not the state as a whole that has such a poor rating but a zone east of the mountains; moreover, Denver, Colorado Springs, and Trinidad account for much of it. It seems to me that the official agencies should now work with precision to seek out and correct these spots of special concentration of this disease.

The National Planning Association

of Washington, D. C., has been making studies of the economic losses from several diseases—including tuberculosis—which have been loaned to me by John Miller, the Assistant Director of the Association. With his permission, I am using their figures.

The studies were made for the year 1943, since that was the latest date for which they could secure all the data they needed. Nineteen hundred forty-three was a war year and so not wholly typical, but their figures are very moderate and it is their trends we wish to emphasize. They estimated that tuberculosis cost the United States for that year about \$174,000,000. This included the care of the ill in sanatoria and at home, case finding, education, rehabilitation, aid to families when the wage earner had tuberculosis, research, and pensions to tuberculous veterans.

They then considered the loss in personal income to families and the losses in goods and services to the nation from this disease. For the 41,631 wage earners who died in 1943, and from those who were ill with the disease that year, they estimate a production loss of \$348,000,000 worth of goods and services.

Then, turning to the cost of reducing this disease to a very low level with the known methods of case finding, cost of care, of follow-up of contacts, rehabilitation, assistance to families, education, and research—they estimated an annual cost in the peak years of \$320,000,000. This figure of \$320,000,000 did not include the cost of new hospitals to provide the necessary beds for tuberculous patients, but they estimated that about \$70,000,000 of the new program for bed construction and equipment should be ultimately assigned to the eradication of tuberculosis.

This was on the basis of a ten year program, with costs lessening as losses gradually diminished. Think of it! For a cost lower, or—if hospital construction is included—only slightly higher,

than the present losses, our annual expenditure for this disease might be reduced from \$174,000,000 to a maintenance cost of around \$36,864,000. It seems to me imperative that we find out the zones of high incidence of this disease and start a ten year campaign to correct present conditions.

Here have been given two examples of data on the economic losses of preventable disease which we might use with increasing skill and with increasing effect on the first of our two major problems: how to get enough money to carry on preventive measures. Dr. Meyer raised the question: "How are we to devise an education for the legislator?" A part of the answer is the skilled use of data on the economic losses of preventable disease.

Now may we turn to our second great infirmity, the lack of trained personnel. This is such a serious ailment that we may expect but limited suggestions.

The Social Security Administration sent out a map of the states in preparation for the recent National Health Assembly in which all the county health units were marked in black, and their absence marked in white and gray. On this map there are two rows of western states of four states each that make essentially a great white way. They are improving their status in regard to health units, but they still have far to go. I refer to Montana, Wyoming, Colorado, and New Mexico as the Rocky Mountain states; and Idaho, Nevada, Utah, and Arizona as an Intermountain Zone.

Now each of these two great western zones has just one medical school. The members from the Pacific Coast may just count their medical schools and then not listen to our troubles. We are beginning to overlook our county lines now to set up District Health units. Why could not we overlook a *state* line or two? We have a really progressive medical school in Denver; it is now a true medical

center. The medical services of the Denver General Hospital, drawing patients for the entire city, have been put under the direction of the medical faculty, so that the school now draws its patients from all of the counties and from the city, as well. Therefore, the school now has ample clinical material. To increase its student body, it needs additional laboratory facilities and increased state appropriations for education and research. Tuition fees nowhere pay for medical education. I asked the Governor of Wyoming what he thought of the idea of having a real part in our Medical Center, and he was greatly interested. There are this year in Wyoming, 50 pre-medical students ready for entering a medical school, and with our system of state universities, it is almost impossible to place them.

Here is probably a pretty stiff proposition to put up to state legislatures, but why not put it to the people first?

Our school could be the Medical Center for the Rocky Mountain states. I do not know the local problem here in Utah, but why could not your great school here in Salt Lake City become the great Medical Center for the Inter-mountain Zone? At any rate, will the delegates from New Mexico, Wyoming, and Montana talk about a Rocky Mountain Medical Center, an institute of medicine, of research, of psychiatry, of dentistry, and of public health as our common possession? Of course, an increased enrollment of medical students is only one aspect of our deficiencies. We need, also, more nurses, more sanitarians, and more sanitary engineers, for personnel is the major problem of health departments.

The pioneers who settled our western states had a tradition of solving their own problems, so why not maintain this tradition with this new and pressing problem of medical education?

Twenty-five Years in Maternal and Child Health

FELIX J. UNDERWOOD, M.D., F.A.P.H.A.

Executive Officer, Mississippi State Board of Health, Jackson, Miss.

NINETEEN forty-six represented another year of real progress in maternal and child health in Mississippi. A further decline of 20 per cent in maternal deaths and of 8 per cent in infant deaths during that year represented the 11th year of continuous decline in the rates for these two figures. The last 10 years have brought approximately 50 per cent reduction.

To those of us who have had the privilege of pioneering in the early days of the Sheppard-Towner Act in 1921 and even before, the situation was not always the favorable one we face today. In 1913, the first year when reliable statistics were available to any state in the South, the puerperal state in Mississippi was responsible for 447 deaths, and diarrhea and enteritis alone in young children was responsible for 678 deaths. In the U. S. Registration Area, in the early 1900's, the annual average rate for 1906 to 1910 was 15.5 per 100,000 for the former and 96.2 per 100,000 for the latter.

In a published article at that time it was commented that "the huge death rate in Mississippi from the puerperal state can be readily accounted for as being due to the fact that the state does not require midwives to be licensed. The death rate from this cause will never be reduced to any great extent until the state requires such persons as engage in the practice of midwifery to have at least some knowledge of cleanliness."

RURAL SANITATION PROGRAMS

Public health programs in Mississippi, and indeed in the nation as a whole, were directed at that time toward better rural and municipal sanitation. Because of the work in the control of hookworm, which had been going on in Mississippi since 1910, widespread interest had been aroused in the serious results of this disease, and in the 3 years 1911 through 1913 some 84,000 children had been examined and 30,941 shown to be infested.

There is perhaps even now no known disease more insidious in its injurious effects upon child life than is hookworm disease. By 1914, however, there was scarcely a school in Mississippi that had not had an address on hookworm by a representative from the Mississippi State Board of Health. There was rather early recognition on the part of our state health department of the need of activity on the behalf of the children in Mississippi. Interest in behalf of mothers on the other hand came somewhat later.

In 1917 W. S. Leathers, M.D., then Executive Secretary of the Mississippi State Board, wrote, "Child health activity in Mississippi has been neglected in the past. There is no greater need in Mississippi today than the study of infant mortality with the hope of reducing deaths among children less than 2 years old and also the medical inspection of children of school age." It was pointed out in the report of the board

at that time that the English Parliament had enacted legislation for compulsory inspection of school children seven years before and that a system of medical inspection of schools had already been in vogue for thirty years in Japan.

The Board in 1917 recommended that a division of child welfare work be established. At that time there were already employed in the public health work of Mississippi four visiting nurses who according to their secretary were "proving themselves of invaluable assistance to the physicians in their mission of instruction and demonstration of the principles of hygiene and through their work in the schools." Some states at that time had as many as a score of these pioneering women.

INITIATION OF THE MIDWIFE PROGRAM

The first official contact of the Mississippi State Board of Health with the midwives and, indirectly, with maternal problems created by their practices, other than the efforts to instruct them in the reporting of births since 1912, was the passage of the model law for the prevention of blindness. This law passed in 1916 required the State Board of Health to educate the physicians and midwives of the state in the use of silver nitrate at birth and was begun by using the total annual appropriation of \$300 (!) for the distribution of considerable literature to the physicians and to the midwives. For the midwives, the literature read:

"Instruction for the Care of the Eyes of Newborn Babies of the State:

"As soon as the baby is born the midwife must carefully clean the eyelids with water that has been boiled. She must wipe the eye from the nose outward without opening the lids, then the eyelids must be separated and two drops of 1 per cent silver nitrate solution dropped in each eye."

The pamphlet concluded by pointing out that "To lose one's sight is like

losing life itself. Save your baby's sight." The county health officer, at that time, of course, a part-time poorly paid official, was made responsible for the enforcement of the law.

ESTABLISHMENT OF THE BUREAU OF CHILD WELFARE

By 1920 the first Bureau of Child Welfare was created, to include prenatal work, medical supervision of school children, supervision of nutrition clinics, and supervision of midwives of the state. Forty thousand dollars was appropriated by the State Legislature, and the U. S. Public Health Service sent in a woman physician to organize the program. After 6 months a full-time director was appointed from the staff of the State Board of Health itself.

An appeal was made to the newly enfranchised women of Mississippi for interest and support of the new bureau. Eleven counties made the first appropriation (\$1,000) necessary for a child welfare unit. Although the principal work was to examine school children, a limited amount of infant, preschool, and prenatal work was carried on. For example, prenatal letters were sent to expectant mothers.

It was recognized soon, however, that child welfare work to be effective must commence with a more intensive prenatal program. In March, 1921, a nurse from the Public Health Service began the registration and holding of classes for midwives. At that time there were in Mississippi 1,700 practising physicians and 5,000 practising midwives, a ratio of about 1 to 3. In the next 4 months, the first group of 922 midwives were investigated and 563 were given permits to continue the practice of midwifery.

Through the interest of the American Red Cross, a Division of Public Health Nursing was established at about the same time under the direction of Mary D. Osborne, R.N., who assumed the re-

sponsibility of the midwife program in February, 1922, and who carried on continuously the direction of this program until March, 1945, almost a quarter of a century.

INITIATION OF THE MATERNITY AND INFANT HYGIENE PROGRAM

At that time too federal funds first became available under the Sheppard-Towner Act in the amount of \$17,067 to be matched with state funds, with an additional \$5,000 available without matching. These funds were intended for the "promotion of the welfare and hygiene of maternity and infancy." The child health program was, up to that time, almost exclusively one of medical inspection of school children. For this reason, in 1922 a new division of maternity and infant hygiene was established under the Bureau of Child Welfare to devote special attention to mothers and to infants and children under 2 years of age.

At that time no less than one-sixth to one-seventh of all deaths that occurred in Mississippi were among children less than 1 year old. The initial program as outlined was considered by the Children's Bureau as the best single state plan presented for that year. By July 1, 1922, 16 additional nurses were added to the staff of the Bureau of Child Welfare, all paid or partly paid from federal funds. Five of these were district nurses who were assigned to the midwife program and who, in the succeeding two years, saw and examined 3,027 midwives.

In 1922, maternity care was needed for about 45,000 mothers each year in Mississippi, of which no less than 22,700 were delivered by midwives. "Some forty-five thousand lives (mothers and infants) were being entrusted annually to the care of ignorant untrained midwives." It was realized, of course, that this was the biggest factor contributing to the high death rate among both

mothers and infants in Mississippi. During the preceding two years no less than 4,670 babies had been born dead in the state. Deaths among infants under 1 year had numbered 5,983, and deaths due to puerperal causes had numbered 704. The economic loss due to stillbirths alone had been estimated at \$350,000 during the preceding biennial period.

As services were extended to mothers in Mississippi it was found early in the program that syphilis was having an important bearing on child health. For this reason, within three months after the establishment of the new Division of Maternity and Infant Hygiene, a nurse was added full-time "whose efforts have been expended mainly with the midwives of the state, teaching them of the ravages of venereal diseases." Among 4,000 blood tests in expectant mothers, 600 were positive for syphilis and the midwives themselves were found to be infected in about 10 per cent of the instances.

EARLY EMPHASIS ON NUTRITION

It might be well to discuss at this time the early emphasis placed by the Bureau of Child Welfare in Mississippi on nutrition. In part, this dates back to the early work of Goldberger in the state on pellagra, for it was in Mississippi that his studies were made proving the dietary nature of this disease, and in part to the extreme malnutrition which the ravages of the hookworm had made so apparent in children of school ages.

Pellagra, in 1914, in Mississippi, was third in rank on the list of causes of death, and was causing the state an economic loss of at least \$2,280,111 a year. About 15,831 cases were reported by physicians in 1915 and deaths were occurring at the rate of 1,500 a year. Children naturally were affected, too. As part of Goldberger's studies, lean meat, milk, eggs, beans and peas were added to the diets of the children in

two orphanages in Mississippi where 209 cases of pellagra had occurred the previous year and the number of cases was reduced to one.

By January, 1921, over six months after the establishment of the Bureau of Child Welfare, a nutritionist was added to the bureau staff. Even at this period in the nutrition program the nutrition worker pointed out that there "was a lack of knowledge of how to cook vegetables" and that "in a climate where vegetables can be grown almost the year round, the vegetables so needed by children are almost unknown." These are statements which may seem familiar even today, to our modern workers in this field. Parents still seemed to consider "weight a much more definite and urgent problem than individual physical defects."

Prominent among the defects of children in Mississippi then, as now, were dental defects. In January, 1923, a new division, that of Mouth Hygiene was organized and work begun with school children. It had been decided that the logical place to begin a program in the prevention of bad teeth was in work with small children. Some three thousand children were examined by a dentist in the first year. An idea of the need for the program can be gained from the fact that at that time the regular activities of the child health program had found that, among 33,317 children examined, some 25,767 had dental defects.

EARLY PROGRESS IN THE MATERNAL AND CHILD HEALTH PROGRAM

By 1922, the total death rate in Mississippi was showing a steady decrease. Public health applied in a planned efficient manner had saved 6,600 lives in four years and Mississippi's death rate was now 10.8 (while California's was 14.1). With the assumption of the position of executive officer of the Mississippi State Board of Health by the director of the Bureau of Child Welfare,

the latter bureau was combined with that of Public Health Nursing, and the director continued as acting director. The American Red Cross support of the nursing program in Mississippi continued until 1924 and the Children's Bureau continued to offer its support and assistance.

The midwife manual was completed by Mary D. Osborne, R.N., in 1924. Within succeeding years more requests came from foreign countries for the midwife manual than for all other health bulletins of the Mississippi State Board of Health combined. A circular letter was sent to every physician in the state at this time, asking if the intensive work done with the midwives was being reflected by a corresponding improvement in the practices of the midwives. The physicians replied in the affirmative in approximately 78 per cent of the cases. Some 2,000 classes for midwives were now being held biennially, attended faithfully by the midwives of the state.

Local health department child welfare services at this time consisted of physical examinations of school children and better baby conferences for babies and preschool children. Medical maternity services were not as yet available, although public health nursing activities included, in the biennium, nursing services to 3,744 pregnant mothers. Public health nursing services were now available on a full-time basis in 25 Mississippi counties, through funds in part derived from the Children's Bureau.

By 1926, the program of the Bureau of Child Welfare might well be described as state-wide. No additions to the fundamental divisions of medical school inspection, nutrition, mouth hygiene, and maternal and infant hygiene had been made. However, there were now 6 dental hygienists, where there had been 1 before. A new program, the establishment of a children's health camp, was begun in July, 1925, intended for children who were convalescing from various illnesses.

This later developed into a full-time preventorium at the State Sanatorium which is still in operation.

Midwife supervision activities continued at an intensive level and physicians over the state attested to the continued improvement in their cleanliness and in the care of the mothers they attended. The type of midwife meeting had now "changed from a dirty, disorderly group, talking and paying little attention, to a group dressed in clean white uniforms and caps, all eager to learn." Of the 4,209 found in the original survey, 2,495 had given up their practice and, together with the new additions, 3,040 were now on the active list. There were 299 organized midwife clubs over the state. For their cases regular organized medical and nursing maternity conferences—a new aspect of the program—were now being held in one-fourth of the full-time county health departments.

GROWTH OF FULL-TIME COUNTY HEALTH PROGRAMS

By 1930, public health programs in Mississippi had become established on a full-time basis in 25 counties and this improvement in the organization of basic public health services was reflected in more efficient services to mothers and children. A liberal interpretation of the Sheppard-Towner Act by the Children's Bureau helped here. County health department reports began to include such statements under the heading of child welfare programs, as "Three hundred and thirty-nine infants and preschool children have been examined and 776 home visits have been made by the nurses (now full-time members of the health department) in the interest of infant welfare work."

The protection of the health of the children of the state, at one time considered only of minor interest, now constituted one of the major activities of the Mississippi State Board of Health.

The infant mortality rate in 1931 was 56.5 per 1,000 in Mississippi while the corresponding national figure was 62. Midwives were still caring for 50 per cent of all mothers in Mississippi at the time of delivery, but the maternal death rate which had been 9.5 per 1,000 live births in 1925 in Mississippi, was now in 1932, 6.0—below the national average. The 375 midwife clubs which were now meeting regularly were carrying out their functions extraordinarily well.

By 1932, the dental hygiene program in Mississippi received a citation from the president of the American Dental Association as being one of the leading programs in mouth hygiene in the states. In a two year period this program had offered 176,000 children dental inspections through the services of 4 itinerant dental hygienists. The nutrition program, however, which had begun so early as an important part of child health activities, had fallen by the wayside.

A new aspect of the maternal and child health program during the year was a coöperative project with the Children's Bureau in postgraduate instruction in the field of obstetrics, using the services of a professor of obstetrics from a neighboring medical school. Nearly one thousand physicians attended a full 1 week postgraduate lecture course. Physicians also began to attend 4 month graduate fellowship courses sponsored by the Commonwealth Fund.

EXPANSION OF BASIC SERVICES TO MOTHERS AND CHILDREN

By 1933, some 13,000 mothers and 26,000 infants and preschool children were receiving medical and nursing services through the 28 organized county health departments each biennium. The Division of County Health Work reported at the end of that year, "greater impetus has been given to the prenatal program and many counties have started or expanded their medical prenatal conferences . . . more infant and

preschool conferences are being held and greater emphasis is being placed on the protection of this age group from preventable diseases."

There was, by 1935, an increasing awareness of the need for anti-syphilitic treatment among the maternity admissions. One county health department pointed out that "of 240 patients coming for antepartum medical care, 90 showed a positive serology; and only 41 had some anti-syphilitic treatment." The maternity services had by now shown such a rapid development that "in a number of counties at the present time the problem is to find some method of limiting the service so that other important activities may receive attention."

INTEREST IN POSTGRADUATE EDUCATION

Through the interest of the Commonwealth Fund, a full-time obstetrician was now available to carry on lectures and clinical demonstrations. In the first 6 month period, 15 towns in Mississippi were offered his services, with an enrollment of 90 per cent of the physicians in each area. Now health departments were finding that most of the maternity cases were admitted to service as early as the 5th month, making it possible to render a more nearly adequate service of supervision and instruction.

One of the original aims of the maternity program had been to secure more deliveries of mothers by physicians. The past twenty years, however, had seen a decrease in the number of physicians in Mississippi from 2,048 in 1916 to 1,515 in 1936, a number actually less than that in 1886. The percentage of midwife deliveries, with the establishment of the Bureau of Child Welfare, had been approximately 50 per cent, and was by 1934 50 per cent. The importance of the long years of planning and of carrying out the midwife supervisory program was thus emphasized. Single counties had as many as 91 midwives enrolled in clubs.

Many unnecessary maternal deaths, however, were still occurring. One health department's report pointed out that in the one county "there were 13 maternal deaths in two years, of which at least one-half might have been prevented if adequate care had been available."

The postgraduate instruction courses in obstetrics were included, the course in obstetrics having reached 820 physicians in 45 towns in Mississippi, or about one-half of the physicians in the state. A similar course in pediatrics was begun and made available to 500 physicians in 18 Mississippi towns. Through the coöperation of the Children's Bureau, a new program of obstetric and pediatric instruction for colored physicians was also carried out, reaching practically all the colored physicians in the state.

Child Health Day activities had been carried on annually each May since 1931 with increasing emphasis. As many as 12,000 child health buttons were made available in one county health department at Child Health Day celebrations. Six years later a special state Child Health Day Committee headed by the Governor was appointed with the slogan "Health Protection for Every Child."

In 1938, the maternal and child health program had been placed under the Division of County Health Work. A full-time obstetrician was employed to offer consultation service to health departments in the examination of prenatal patients. Still, "almost daily," at this time, it was pointed out, "some mother in the state dies of a preventable condition associated with pregnancy." Fully 80 per cent of the deliveries were being carried out in the home of patients, and hospital deliveries were reserved for obstetrical emergencies.

ESTABLISHMENT OF THE FIRST HOME DELIVERY SERVICE

A new demonstration program in Pike

County offered to physicians maternity nursing service at the time of home delivery. During the first 8 months, the services of the public health nurses were used in 67 per cent of all home deliveries. In addition, sterile ready-packed home delivery kits were made available to physicians in many Mississippi counties where predominantly home deliveries were made. This was an effort directed toward reducing further the 28 per cent of the maternal deaths which were due to infection.

In the biennium 1939-1941, the Division of Maternal and Child Health was established under a full-time medical director. Maternal death rates were now 6.2 per 1,000 and infant death rates were 54.5 per 1,000. The number of midwives had dropped to 2,997. The colored maternal mortality rate which had been 12.8 in 1930 was now 7.5 in 1940. Under the stimulus of the new division, along with the increasing number of organized full-time county health departments, the number of mothers admitted to antepartum medical service numbered 15,578 in the biennium, an increase of 34.2 per cent. Toxemias of pregnancy were, in 1939, responsible for 30 per cent of all maternal deaths, in fact the leading cause of maternal deaths; and in a great measure preventable. Infections were responsible again for another 28 per cent of the deaths and in a great measure preventable also.

The number of infants receiving nursing service increased to 30,286. There were now 245 maternity centers offering antepartum medical and nursing services and 435 child health conferences. By the addition of a pediatric consultant, recognition was given to the emergency needs of the premature infants, which make up some 20 per cent of the infant deaths each year in Mississippi. Approximately 2,500 premature babies were being born yearly. Public health nurses were instructed in the care of the premature infant, incubators were pur-

chased, and emergency supplies made available to each organized county in the state.

Nutrition, with all of its manifold important public health aspects, was reestablished as an additional service of the Mississippi State Board of Health in 1942. A study of the dental hygiene program at about this time showed that Mississippi children had a lower rate of dental decay than in most eastern states. Public health nursing services had grown until there were now more than 200 public health nurses on duty in the 65 full-time county health departments. The anti-syphilitic program, so important a factor in maternal and child health work in Mississippi, was now extending 1,018,000 treatments a year to Mississippi citizens.

INITIATION OF THE MISSISSIPPI EMERGENCY MATERNITY AND INFANT CARE PROGRAM

In April, 1943, the Mississippi Emergency Maternity and Infant Care Program was initiated to offer through family physicians maternity and pediatric care for the wives and infants of enlisted men serving in the armed forces. In the next 3 months, some 1,400 applications were received. Eventually, during the 4½ years of its operation 25,667 applications have been made to the program. A statistical study of the program's 5,259 deliveries in 1944 showed that the per cent of hospital deliveries was doubled, the stillbirth rate was halved, and the maternal death rate was reduced to one-third of the corresponding figure for all the births in the state that year.

The number of hospital deliveries in Mississippi increased sharply from a total of 9,000 to 17,000 within a 4 year period—1941 to 1944—in large part due to the stimulus of the EMIC program. Seventeen thousand mothers were now receiving antepartum medical services and 26,000 antepartum nursing services

through their county health department during a biennial period. Some 56,000 maternity visits were contributing much to continued reduction in maternal mortality figures—from 6.2 to 4 per 1,000 in the 5 year period—1940–1944. Infant mortality rates were showing a decrease like that of the maternal rates, dropping from 54.5 in 1940 to 43.6 in 1944. The total loss of life from stillbirths and infant deaths was still, however, appallingly high. For example, the total known loss of life in this group in Mississippi for the 5 years 1939 through 1943 was 26,720.

Planned parenthood services were also made a part of the maternity program, the state receiving the Albert and Mary Lasker Award for its outstanding work in this field. Postgraduate programs in obstetrics and pediatrics during the war-time years reached one-fifth of the physicians in active practice. Some 305,000 copies of infant and child health literature, either from the Children's Bureau or prepared by our own Division of Maternal and Child Health, were distributed in the biennium. Sixty-six hundred maternity or infant and pre-school conferences were held during the biennium—1943–1944, or an average of 10 a day throughout the state. In the nutrition program, 76,000 pieces of nutrition literature were distributed.

NEW PROGRAMS IN THE MATERNAL AND CHILD HEALTH FIELD

A new program in child health was added, that of child guidance in 1943, and 9 branch centers for child guidance activities were established under the direction of a child psychiatrist and her staff.

The rapid growth of the child guidance program suggests that it may develop into a whole mental hygiene program of its own. Referrals increased rapidly. There was also an increasing awareness of the importance of tuberculosis to the mater-

nity program. It was estimated that approximately 1,200 women with active tuberculosis were giving birth to infants yearly. Deaths from puerperal causes in Mississippi numbered 233 in 1943, while deaths in women from tuberculosis in the same age group numbered 298.

Wartime shortages in medical and nursing personnel interrupted to some extent the steady progress in maternal and child health in Mississippi. Consultants in pediatrics and obstetrics were no longer available, and shortages of faculty members in medical schools interrupted the postgraduate courses. Now, however, again the postgraduate program is being expanded. Consultants in pediatrics and obstetrics are again available through a unique arrangement with the school of medicine of the University of Tennessee and of Tulane in the fields of obstetrics and pediatrics.

The hospital construction program under the Hill-Burton Act promises to construct the 1,600 hospital beds for maternity purposes, so long an unmet need in Mississippi. With them, better hospital facilities for the care of the premature infant and other pediatric conditions are being added. The Blue Cross program promises surgical and hospital care on a voluntary prepayment plan basis to many groups in Mississippi.

Midwife deliveries in 1946 dropped to 37 per cent, the lowest in the history of the state. About 40 per cent of all deliveries are now occurring in hospitals. The maternal death rate in 1946 was 3.2, the lowest in the state's history and a figure representing a decrease of 20 per cent in one year. Infant death rates had shown a further decrease of 8 per cent to reach another all-time low of 36.8 per 1,000 live births. Forty thousand children a year are being immunized against diphtheria through county health departments, and deaths from diphtheria in the state numbered 31.

In 1946 similar decreases in the incidence of syphilis and of tuberculosis among expectant mothers were taking place. Malaria, typhoid fever, and pellagra can now be considered as of the past.

Hookworm, however, is still crippling thousands of children. Dental decay is still a major public health problem in Mississippi and elsewhere. Malnutrition, in a lesser degree of severity, is still widely present in the population. Its great importance in the control of eclampsia and in the prevention of premature births and stillbirths is beginning to be realized. The mental hygiene aspects of pregnancy are being studied in a demonstration program. The planned

parenthood program is being extended and the possible advantage of x-ray pelvimetry in the maternity program are being explored.

Seventy years ago the infant mortality rate in Mississippi was estimated by an early physician as being approximately 250 infant deaths for each 1,000 live births. We, in the South, are looking forward within the next 10 years to an infant mortality rate of 25 per 1,000 live births, or exactly one-tenth the figures of three-quarters of a century ago.

NOTE: Gratitude is hereby expressed to Dr. Virginia Howard, Director of the Division of Maternal and Child Health, Mississippi State Board of Health, for collaborating in the preparation of this article.

"Our challenge in this generation is to discover the common interests, the terrain of possible collaboration, the overlapping areas of curiosity and sympathy, of aspiration and mutual advantage, that bind the human race together regardless of ideologies or boundary lines. The search for these rallying points of unity, the development of new techniques and areas of coöperative action where ideas and experience can be pooled and combined—this is the immediate task; this comes first; this is the foundation of the ultimate structure of a united society.

"The activities of the World Health Organization of the United Nations furnish a pertinent illustration; for health is something that all men desire and there is no limited supply for which nations must compete. Public health

work carries no threat to anybody, anywhere. Cancer and scarlet fever have no political ideology. There is no Marxian method of eliminating gambiae mosquitoes as distinguished from a Western democratic method. The principles of sanitary engineering do not bear a Russian or an American label. No difference exists between tuberculosis in the Soviet Union and tuberculosis in the United States. Infantile paralysis is the same thing in Moscow and in Washington, and human sorrow is no less poignant in one city than in the other. The world of disease and misery is not divided; it is a common world. In terms of human suffering the world is truly and tragically one world." — Raymond B. Fosdick, *Rockefeller Foundation—A Review for 1947*.

Cave Sickness A New Disease Entity?

A. M. WASHBURN, M.D., M.P.H., JOHN H. TUOHY, M.D., AND
ELMER L. DAVIS, M.D.

Director, Division of Communicable Disease Control, Arkansas State Board of Health, Little Rock, Ark.; Senior Assistant Surgeon, U. S. Public Health Service, Epidemiology Division, Communicable Disease Center, Little Rock, Ark.; and Foreman, Ark.

DURING the past year we had the opportunity to investigate in Arkansas an outbreak of a peculiar pulmonary disease, mention of which appears only once to our knowledge in medical literature. Cain¹ and his co-workers published a report on just such an episode which occurred in the neighboring state of Oklahoma in 1943. Later a personal communication noted another similar instance happening in Mexico.²

In none of the investigations including our own, was an etiologic diagnosis established. We have dubbed the condition "cave sickness" because of the feature common to all three outbreaks and have concluded that this is a new or at least inadequately described disease entity.

Our study was conducted on 21 white male patients who represented the greater part of the 25 persons engaged in a treasure hunt in an old abandoned chalk mine in southwestern Arkansas. Excavation was started September 12, 1947. At intervals beginning with the 4th and ending with the 13th day of operations, all of those who had spent any time in the cave became ill in varying degrees of severity. Data in Table 1 give the ages, incubation periods, calculated from patient's first visit to the cave to date of onset, length of exposure, which could not be defined in terms of hours and minutes, and type of disease.

Only individuals who had entered the diggings were involved in the outbreak. Among them the disease took the form of a febrile illness with pulmonary manifestations. Onset was sudden after a short prodrome of coryza and malaise followed by chills and fever.

The rest of the symptom complex was composed of headache, in some cases with retro-orbital pain, nuchal tension, nervous irritability, slight cough, chest pain, weight loss, and certain general complaints.

There was a dearth of physical findings. Aside from increase in temperature and pulse, all signs were confined to the chest where sonorous inspiratory and expiratory rales were heard early in the illness. These later became moist and sticky and disappeared after coughing.

Clinical laboratory studies were not revealing. Chest radiographs were spectacular and in keeping with the prostration of the patients. The report on these is as follows³:

"The striking features of all the films evincing marked pulmonary involvement are the uniform distribution of the lesions from top to bottom, their consistent size and shape, the lack of any tendency to confluence, the absence of any pleural reaction, and the freedom from involvement of both the bronchopulmonary and tracheobronchial lymph nodes. It is my opinion that this process was pro-

TABLE 1

*Patients According to Age, Incubation Period in Days,
Type of Exposure, and Severity of Disease*

| <i>Patient</i> | <i>Age</i> | <i>Incubation period</i> | <i>Length of exposure</i> | <i>Type of disease</i> |

| M. B. | 18 | 7 | moderate | severe |

duced by a particulate entity which was spread almost entirely by hematogenous dissemination and which occurred in a single shower."

All patients received sulfamerazine and penicillin in therapeutic amounts without noticeable response. The disease was apparently self-limited to 6 or 7 days at which time the men were able to leave their beds although they complained of weakness and a residual dyspnea. These last persist to this writing (February 26, 1948).

The patients suffered in three degrees of severity. We present the record of a patient with the severe type of affection. The moderate and mild cases had lower temperatures and less marked prostration. Length of morbidity and extent of disability in convalescence did not vary in the three classifications.

M. M., 23 year old white planter. This patient worked prolonged periods in the cave. On the 4th day after beginning work there he noted a mild coryza with "stuffed-up" head, dry throat, and feeling of slight malaise. Late in the evening he had a shaking chill during which time his temperature reached 105° F. This was followed by profuse sweating. His temperature remained between

103° F. and 105° F. for 72 hours, despite treatment with oral penicillin, 100,000 units every 3 hours, and a sulfamerazine mixture containing 1 gm. of sulfamerazine and 1 gm. of potassium citrate per teaspoon. Resolution of his fever was by crisis, but for 4 days thereafter the patient had a daily afternoon elevation up to 103° F., accompanied by a shaking chill and followed by sweating.

At the onset the patient complained of severe headaches, retro-orbital pains, and a definite nuchal tension, and exhibited a marked nervous irritability characterized by dramatic response to stimuli. However, on the 4th day of his illness he became lethargic and lapsed into what was described as a semicomatose state lasting about 48 hours, from which he recovered spontaneously.

He also complained of anorexia and slight nausea, and lost 24 pounds during his illness. His illness was self-limited to 7 days, after which time he was able to leave his bed. His appetite improved and his general feeling of malaise disappeared, but during convalescence he was bothered by a definite fatigability and shortness of breath. Also among his

residuals were numbness and paresthesia along the course of the ulnar nerves in both hands. His past history had been entirely negative except that he had contracted dengue fever while serving on Tinian Island during World War II.

Physical examination revealed a temperature of 103° F., rapid pulse and respirations and very few other positive findings. These were entirely confined to his chest with wheezing inspiratory and expiratory rales early in his illness, which later changed to moist, fine inspiratory rales disappearing after coughing. Laboratory studies revealed 4,190,000 RBC, 8,400 WBC with a normal differential. Widal was positive in 1:80 dilution (patient had typhoid vaccine while in military service). Negative agglutinations for tularemia and Q fever were obtained. His sera failed to protect against the viruses of the psittacosis-lymphopathia group, Saint Louis and western equine encephalitis, and were negative for cold hemagglutinins.⁴ Complement-fixation for *Histoplasma capsulata* was four plus in dilution of 1:2 and one plus in dilution of 1:4 on two successive examinations at a 6 week interval. Coccidioides studies revealed the same results.⁵ Peripheral blood examinations for the spirochetes of relapsing fever and the parasites of malaria and toxoplasmosis were negative.⁶

His urine was normal. Respiratory capacity was 3.8 liters. Sputum and throat cultures on blood agar and Sabouraud's media revealed a normal flora. Direct smears of this material for tubercle bacilli, eosinophiles or other cellular elements were negative.⁶ Spinal fluid was not obtained.

Skin tests with coccidioidin in dilutions of 1:1,000 and 1:100 were negative as were those with histoplasmin at 1:100 and 1:10. Intradermal O. T. in a dilution of 1:1,000 was positive. The report of the radiologist³ on this patient is as follows:

"Three serial postero-anterior films on this

individual have been reviewed. The first is not dated but is presumed to have been taken the latter part of September. The second film was made October 8, 1947, and the third was made November 29, 1947. The first film presents a picture almost identical with an acute miliary tuberculosis. The lung fields are uniformly studded from apex to base with minute, discrete infiltrations measuring 2 mm. in diameter. These shadows suggest that the process is of an exudative nature. There appears to be no tendency for confluence of the lesions, and special attention is called to their individual nature. The lesions appear to occur at the bifurcations of the linear chest markings. There is no apparent pleural reaction and there is no involvement of the bronchopulmonary or tracheobronchial lymph nodes. There is a Ghon tubercle in the left costophrenic angle but this is thought to be unrelated to the present pathological process. The diaphragmatic shadows are regular in contour and sharp in outline. The heart is of apparent normal size and contour, and no bony abnormalities are noted.

"Diagnosis: An acute miliary pneumonitis, apparently of hematogenous dissemination but of unknown etiology.

"The subsequent films show an even clearing of the lung fields by absorption, so that the film of November 29, 1947, is practically normal. There is certainly, however, no evidence of replacement fibrosis in the sites of the individual lesions, nor is there any apparent attempt at calcium deposition. There is insufficient evidence on the film of November 29, 1947, to explain the residual dyspnea complained of by the patient."

The chief symptoms of which the patients complained are tabulated (Table 2).

TABLE 2

Symptoms, with Number and Percentage of Patients Exhibiting Each

| Symptom | Number of patients | Per cent of patients |
|--------------------------|--------------------|----------------------|
| Fever | 20 | 95 |
| Headache | 20 | 95 |
| Coryza | 19 | 94.7 |
| Cough | 17 | 81 |
| Chill | 14 | 67 |
| Sputum | 13 | 62 |
| Nausea | 13 | 62 |
| Sweating | 10 | 47 |
| Vomiting | 9 | 43 |
| Chest pain | 8 | 38 |
| Nuchal tension | 8 | 38 |
| Nervous irritability | 6 | 30 |
| Retro-orbital pain | 3 | 14 |
| Coma | 1 | 5 |
| Neurological disturbance | 1 | 5 |

In the severe cases the initial temperature reached 103° F. to 105° F. It persisted at a relatively high level for 48 to 72 hours, and dropped by crisis to normal or nearly normal. Subsequent daily afternoon elevations to 101° F. to 103° F. for 3 or 4 days occurred. In the moderate to mild cases the fever was of a lower degree and less typical in its course.

Headache was the presenting complaint in nearly all patients seen. This headache was severe, generalized, and persistent. Temporary relief was obtained from patent remedies and codeine. Several patients developed a post-orbital pain in association.

Coryza with a "stuffed-up" head, dry throat, and occasional rhinorrhea was a very common prodromal sign. Two patients complained that their palates felt "corrugated." None admitted or mentioned sore throats.

The cough was of a hacking type, productive of very little sputum. At the time they were seen only 2 patients were producing enough sputum for examination.

About half the patients had a definite rigor, the others merely a chilly sensation. In those who had the true shaking chills, sweating followed, soaking bed clothing and linens. In all cases the first chill followed within 12 hours of onset of their malaise.

In 7 patients the chest pain was of a sharp constricting type noticeable on deep inspiration at a point under the lower part of the sternum. Another patient stated that his was a sharp, stabbing, pleuritic pain over the left lower anterior ribs which forced him to breathe shallowly for the 3 to 4 days it lasted.

The complaint referable to the patients' necks was not definite pain or rigidity, but what they described as a tense feeling which did not prevent but rather discouraged movement of the neck and turning of the head.

The nervous irritability was characterized by striking response to the stimulation of noise, touch, and shaking of the bed by involuntary movements of their extremities. One patient became irrational and lethargic and remained semicomatose for about 48 hours. This same patient complained of numbness and paresthesia of both hands along the distribution of the ulnar nerve. This numbness was not confirmed neurologically.

Malaise was complained of generally as was anorexia. Nausea and vomiting followed medication with sulfa and oral penicillin in some patients. No urinary or bowel disturbances occurred.

DIFFERENTIAL DIAGNOSIS

Our differential diagnosis in this outbreak was an extensive one. It ran the gamut of disease entities from the usually suspected to the more exotic and bizarre (Table 3).

TABLE 3

Differential Diagnoses Considered

- I. Inhalation of Irritants
 - A. Gases
 - B. Dusts—Pneumoconioses
- II. Pulmonary Infections
 - A. Bacterial
 1. Lobar pneumonia, pneumococcal
 2. Tularemia pneumonia
 3. Bronchopneumonia
 4. Interstitial pneumonia, acute
 5. Bronchiolitis, acute
 6. Acute disseminated hematogenous tuberculosis
 - B. Viral
 1. Primary atypical pneumonia
 2. Influenza
 3. Psittacosis (ornithosis)
 - C. Rickettsial—Q fever
 - D. Fungal
 1. Coccidioidomycosis
 2. Histoplasmosis
 3. Bronchopulmonary moniliasis
 - E. Protozoal—toxoplasmosis
- III. Malaria
- IV. Dengue fever
- V. Relapsing fever

It was the belief of the people of the town that gas inhalation was the basis of the victims' difficulties. Some of the radiologists who viewed the plates felt that the picture could conceivably fit such a diagnosis. Analysis of samples of air from the cave, which consisted of a series of small rooms connected by small apertures, failed to reveal any noxious gases or organic irritants.⁷ Two guinea pigs left in the cave for a prolonged period remained perfectly well. We also scouted the possibility of the condition arising from the inhalation of an irritant dust of the material from the cave substance. The rock in the cave analyzed as typical limestone⁷ (Table 4).

TABLE 4

Analysis of Rock from Cave

| <i>Component</i> | <i>Per cent</i> |
|-------------------------|-----------------|
| Magnesium | 0.23 |
| Loss on Ignition | 38.46 |
| Calcium | 60.40 |
| Aluminum and Iron Oxide | 0.04 |
| Total Silicates | 0.09 |
| | <hr/> 99.22 |

The content of silicates was less than 0.1 per cent. No arsenic, zinc, beryllium, or other heavy metals were present. We did not examine for the presence of radioactivity.

Among the bacterial infections, lobar pneumonia of the pneumococcal type and tularemic pneumonia were fairly well eliminated by negative bacteriology, agglutination tests, and x-ray picture.

The radiographic picture was regarded by some as consistent with a diagnosis of a bronchopneumonia, an interstitial pneumonia, or an acute bronchiolitis. We were not able to establish a bacterial agent as a cause of any of these. It was suggested that an organism which we do not usually consider pathogenic was at fault. We found a distinct inconsistency in the flora of the sputa and throats of the patients so that it was not possible to

implicate any inhabitants. The blood cultures done were negative.

The diagnosis of acute lymphohematogenous tuberculosis has been readily dismissed in spite of the roentgenograms by the conduct of the disease. No acid-fast organisms were obtained from the sputa by direct smear or culture. Only 3 patients had positive tuberculin tests.

Primary atypical pneumonia, influenza, and psittacosis (ornithosis) were considered. The first did not fulfil the x-ray picture of our cases. Studies for cold hemagglutinins were negative. The absence of cross-infection seemed to militate against the diagnosis of influenza as did the peculiar restriction of the disease to the cave workers. No psittacine or columbian birds were found in or about the cave to indicate the possibility of ornithosis. Protection tests against ornithosis-lymphopathia virus were negative.

Q fever was likewise considered. None of the patients had skin lesions and they all denied having ticks on their clothes or bodies. No ticks were found in or around the cave although undoubtedly there were some on the cattle in the vicinity. Agglutinations were negative.

With the coöperation of many persons and agencies, we were able to do fungus studies. Sputum and throat swabs grown on Sabouraud's medium were negative. Repeated skin tests with histoplasmin and coccidioidin down to dilutions of 1:10 and 1:100 respectively were also negative. No material was available for skin testing against *Candida albicans*.

Complement-fixation for coccidioidomycosis and histoplasmosis was no more revealing than the above case.

Peripheral blood studies for malaria and toxoplasma parasites were negative. No spirochetes of relapsing fever were found in blood or urine. We were unable to obtain complement-fixation for this disease.

No rash was present and other clinical features of this outbreak did not fit the pattern of dengue fever. We were unable to obtain serum protection tests. No *Aedes aegypti* mosquitoes were found although culicines and anophelines were present.

It is evident from the foregoing that we were unable to establish an etiological diagnosis in this outbreak. Our work-up was extensive and we have persisted in following these patients with serial x-ray films. Radiographs have gradually cleared. As previously stated, in all instances the patients still complain of dyspnea on exertion and marked fatiguability. All have, however, returned to their work and studies.

SUMMARY AND CONCLUSIONS

We present here a report of 21 cases of a febrile illness with pulmonary manifestations and a peculiar x-ray film.

An extensive differential diagnosis was considered without a definite etiology being established after extremely careful comprehensive study. Reference is made to the only other known outbreak of a similar nature which is recorded in the literature. We conclude from this that we have investigated a new or, at least, a previously inadequately described disease entity.

Schick Testing and Diphtheria Immunization of United States Troops in Europe

LT. COLONEL HARTWIN A. SCHULZE, MEDICAL CORPS
Chief, Preventive Medicine Branch, European Command

DURING the winter of 1946-1947, United States troops in Europe who were under 35 years of age were immunized against diphtheria. This report deals with certain features of this large diphtheria immunization experience with adults.

The program was undertaken because of the high diphtheria rates prevailing in the command during the first half of 1946. During this six month period the diphtheria rate averaged 6 per 1,000 per year.

Diphtheria immunization had not been carried out prior to that time, presumably because it was feared that a considerable disability would result from toxoid reaction.

In determining how the program was to be carried out, the following factors were considered paramount:

1. Fluid toxoid leads to many less reactions in adults than alum-precipitated toxoid.
2. Schick-positive persons have a much lower proportion of toxoid reactions than Schick-negative persons.
3. Less than half of the military population was thought to be Schick-positive.

The conclusion was that the number of reactions could be kept at a minimum without sacrifice to the efficacy of the program by immunizing only the Schick-positive persons using fluid toxoid.

This course of action also precluded the poor public reaction which might have followed the "immunization"

of over 100,000 Schick-negative persons in whom the procedure was not indicated.

Army regulations in force at that time, but since rescinded, stated that because of "the meticulous care necessary to obtain reliable results," and because of "other inherent difficulties, mass Schick testing will seldom be feasible." This objection to Schick testing was not considered tenable since it could be overcome by a brief course of instruction. A detailed directive was accordingly issued on the "Methods and Principles of the Schick Test and Diphtheria Immunization Using Plain Toxoid." Conferences were held in which the directive was discussed, the mechanics of the Schick test demonstrated, and subjects were exhibited showing reactions to the Schick test and Schick test control in their various stages of development and regression. It is believed that, because of this preparation, the program was subsequently carried out in a reasonably satisfactory manner.

The results of the Schick testing and the occurrence of toxoid reactions were compiled in table form by the doctors doing the work. More information was not solicited because it was realized that the more details asked for, the less reliable the information would be.

SCHICK TEST SURVEY
The Schick test and Schick test

control were carried out using 0.1 ml. (1/50 m.l.d.) of Schick test toxin in one forearm and an equal quantity of heated toxin provided by the same manufacturer in the other forearm.

Because of administrative considerations, only one reading was made. That was done after 96 hours. A skin reaction was considered positive when the area of redness and induration measured 1.0 cm. or more in its greatest diameter.

Because of the fact that the tests were done and results interpreted by a great number of physicians, the strict reliability of the compiled results would be questionable. The results were, therefore, tabulated in two groups. The one group included two large stations at which the program was in reliable hands. The results of this tabulation are given in Table 1. All other returns on hand on an arbitrarily chosen deadline, were included in the other group. They are presented in Table 2.

Referring to Table 1, it will be noted that 29.7 per cent of all persons tested were either Schick-positive or Schick-positive combined.

It had been expected that the percentage of susceptibles would be about 40 per cent. In a Schick test study conducted by the Office of the Surgeon General in 1944 using 1,500 recently inducted soldiers at Camp Ellis, Illinois, and a similar number at Camp Tyson, Tennessee, it was found that 43.7 and 45 per cent respectively gave Schick-positive or combined reactions. (A reaction was considered positive if it was 5 mm. or more in diameter.)

The discrepancy was primarily due to the fact that, in spite of directives to the contrary, most units sent all personnel to the medical installation for Schick testing instead of compiling a list of those whose immunization registers showed no diphtheria immunization within the previous five years. It was estimated that about 30 per cent

* Tests and interpretations were done by a large number of medical officers and the results are accordingly not strictly reliable.

of the command had undergone some active immunization during the previous year. This included hospital personnel, persons in units in which diphtheria occurred, and replacements arriving from the United States since May, 1946. Since Schick testing was not done during this time, the immunizations were carried out on Schick-positive and Schick-negative persons in the proportion in which they were present in the command. If an adjustment is made for these previous immunizations the results of the Schick survey would more closely approach those obtained at Camps Ellis and Tyson.

A more interesting feature than the overall Schick status is the Schick status in the various age groups. Still referring to Table 1, it will be seen that there is a steady increase in the proportion of Schick-positives from the lower to the higher age groups. In the 18-19 year old group 26.7 per cent were Schick-positive or combined reactors whereas in the 30-34 year old group the percentage was 32.8. In persons over 34 years of age the percentage was still higher, viz. 35.7 per cent, but because of the small number of persons in this age group the increase in the percentage of Schick-positives is no longer significant. In a Schick survey of naval recruits Cheever found a similar though more marked rise in Schick-positivity with increasing age.¹

This result was entirely unexpected. Analyses of case histories had shown that age-specific morbidity rates were higher for the younger age groups. Since this cannot be accounted for on the basis of immunity, exposure suggests itself as a possible explanation.

Since reactions to the Schick test control material depend on a sensitivity acquired as a result of prior experience with the *Corynebacterium diphtheriae* it would seem reasonable that the majority of such reactors would be found among those who are Schick-negative.

In the present survey 6.1 per cent of those tested reacted to the control material. Of these, 4.4 per cent were Schick-negative and 1.7 per cent were Schick-positive. When the calculations are based on the number of Schick-positives and Schick-negatives separately, rather than on the total number tested, it is found that the percentage of control reactors is not statistically different from the distribution of reactors to the Schick test itself. The control reactors constituted 6.2 per cent of the Schick-negatives and 5.8 per cent of the Schick-positives. These percentages should probably be greater. The reactions were observed only once and some reactions which disappeared before the 4th day were probably not recorded. This error would, however, operate the same for both Schick-positive and Schick-negative groups. The percentage of subjects sensitive to the control material was only about one-half or one-third of that expected. A possible explanation is that the materials used were very low in their content of reaction-producing substances.

There is a rather steady rise in the percentage of reactors to the control materials both in the pseudo and in the combined reactors with increasing age. In the 18-19 year age group 4.0 per cent of those tested reacted to the control material, whereas in the over 34 year age group the percentage was 10.7. This is in accordance with the frequently made observation that older persons are especially apt to exhibit toxoid sensitivity. Although the Schick-negative status and sensitivity both depend on previous experience with the diphtheria organism (or its products), these two factors seem to have a reciprocal rather than a direct relationships to each other throughout the age groups.

Table 2 is similar to Table 1, except that it is based on reports of varying degrees of reliability. Although the

percentage of Schick-positives is 5 to 10 per cent lower in the various age groups, the other results in general have the same characteristics found in Table 1.

IMMUNIZATION PROGRAM

Diphtheria immunization was carried out on the Schick-positive and Schick-positive combined reactors according to the following schedule:

0.1 ml. as test dose, subcutaneously
0.5 ml. 48 hours after test dose
1.0 ml. 3 weeks after previous dose
1.0 ml. 3 weeks after previous dose

Instructions required the discontinuance of injections when a severe reaction occurred. A severe reaction was defined as "local edema or induration more than 6 cm. in diameter or a marked constitutional reaction with fever over 101° Fahrenheit."

A tabulation of the reactions occurring during the immunization of Schick-positive and Schick-positive combined reactors is given in Table 3.

After the 0.1 ml. dose 3.1 per cent were excused from further doses. Of these who took the 0.5 ml. dose those excused constituted 2.4 per cent. Reactions to the third and fourth doses (1.0 ml.) were substantially less frequent.

In the Schick-positive combined group, the proportion excused was two

to three times as high for each injection as in the Schick-positive group.

Because of the absence of strict administrative control over those being immunized, it may be that not all the toxoid reactors were recorded. The men were not required to report for observation after injection, and it is likely that at least some of those who had severe reactions did not report the fact but merely avoided subsequent injections.

In order to determine what proportion had reactions severe enough to be admitted to the hospital, a check was made of the admission records of two hospitals serving about 40,000 men. In that group, there should have been at least 10,000 undergoing immunization. Only two admissions for diphtheria toxoid reaction were found. Since admission to quarters was not extensively practised, it is doubtful that many more serious disabilities occurred.

Following the immunization program, diphtheria rates were strikingly lower than before. During the 12 month period April, 1947, to March, 1948, following the program, the rate was 0.7 per 1,000 as compared with a rate of 4.8 for the 12 month period immediately preceding the program. Practically all cases that have occurred since the completion of the program were in those who had not been im-

| 1.0 | 5,672 | 6 | 0.1 | | 235 | 0 | 0 | |

* Reaction defined as "local edema or induration more than 6cm. in diameter or a marked constitutional reaction with fever over 101° Fahrenheit."

† The number of persons receiving each dose varied considerably because of redeployment, transfer to other units, incompletion of series when the data were collected, and other administrative reasons.

munized at all or had not completed the immunization series because of administrative neglect. None whose series was incomplete because of toxoid sensitivity contracted the disease. At least two who were reported as Schick-negative contracted the disease.

The reduction in the diphtheria incidence in troops was undoubtedly also influenced by the decreasing incidence among the German civilian population. The German civilian rate for periods corresponding to those mentioned above was 2.6 and 1.6 per 1,000 respectively. This was a drop of 39 per cent as compared with a drop of 85 per cent for troops.

SUMMARY AND CONCLUSIONS

There was a very high diphtheria morbidity in United States troops in Europe during 1946. Schick testing showed that about 30 per cent of the persons under 35 years of age were Schick-positive or combined reactors.

The proportion of Schick-positives had been reduced by active immunization carried out during the previous year.

There was a definite rise in the percentage of Schick-positives from the lower to the higher age groups. This was perhaps due to a smaller proportion of persons in the higher age groups who were immunized in childhood, due to the existence of a longer interval in the older age groups during which immunity acquired in childhood could have worn off, or due to a reduction of the frequency of anamnestic booster action because of the more sedentary habits of older age groups.

Reactions to the control material occurred with the same frequency in the Schick-negative and Schick-positive groups. There was an increase in the proportion of pseudo and combined reactors from the lower to the higher age groups.

Schick-positive and Schick-positive combined reactors were immunized using fluid, formol, toxoid according to the following schedule: 0.1 ml., 0.5 ml., 1.0 ml., and 1.0 ml. The 0.5 ml. dose was given 2 days after the 0.1 ml. test dose. The other doses were given at 3 week intervals.

In Schick-positive-control negative persons severe reactions consisting of "local edema and induration more than 6.0 cm. in diameter or a marked constitutional reaction with fever over 101° Fahrenheit" occurred in 3.1 per cent of those taking the first dose and less frequently thereafter. Reactions in the Schick-positive-control positive group were about three times as frequent.

The percentage of persons having reactions sufficiently severe to require hospitalization was extremely small—less than 0.1 per cent.

Diphtheria immunization of Schick-positive and Schick-positive combined adults using fluid toxoid according to the schedule given above is a practical and safe procedure.

ACKNOWLEDGEMENT: Claude M. Eberhart, Major, M.C., and Edward F. Rabe, M.D., were of great assistance in carrying out this program.

Sanitary Significance of Cocci in Swimming Pools

CASSANDRA RITTER, F.A.P.H.A. AND E. LEE
TREECE, Ph.D., F.A.P.H.A.

*Division of Sanitation, Kansas State Board of Health, Lawrence; and
Department of Bacteriology, University of Kansas, Lawrence, Kan.*

THERE has long been a feeling among sanitarians and laboratory workers that the test for the coliform group of organisms is not an adequate index of the safety of swimming pool water, since this index does not take into consideration the possibility of contamination from the skin and upper respiratory tract of the bather.

The streptococci have been suggested and investigated as indicators of pollution. Mallmann and associates¹⁻⁴ proposed a method of isolation, and they and others⁵ gave evidence to show that these organisms fluctuate with the bathing load and are resistant to chlorine. *Standard Methods for the Examination of Water and Sewage*⁶ in the 8th and earlier editions gave tentative and optional directions for the determination of streptococci by making microscopic examinations of the sediment from lactose-broth fermentation tubes. In the 9th edition, no reference is made to streptococci in the section on bacteriological control of swimming pools.

The use of *Neisseria catarrhalis* as an index of pollution has been proposed by Tapley and Jennison.⁷ The isolation of *Staphylococcus albus* from swimming pools was reported by Stokes,⁸ but it has not been considered as an indicator organism.

Methods for classifying the streptococci have been outlined by Sherman.⁹ The normal fecal streptococci were studied by many workers,¹⁰⁻¹⁵ and classed as

a central *Streptococcus fecalis* type and variants, some undoubtedly salivary types; and some strains similar to *Streptococcus pyogenes*. The low invasive powers of the enterococcus and its wide distribution have been noted.¹⁶⁻¹⁸ The incidence of various types of streptococci in the nose and throat has been determined under diverse conditions.¹⁹⁻²¹

Better methods for the isolation of the streptococci have become available recently through the use of sodium azide²²⁻²⁵ as an inhibitory agent for Gram-negative rods. It was used in a 1-5,000 concentration by Mallmann²² for the detection of streptococci in sewage, and by other workers^{26, 27} for the isolation of enterococci from various waters. The present authors devised a new liquid medium containing sodium azide for use in this survey.

The study here reported was made to determine the incidence of streptococci in swimming pools in Kansas during the summer seasons; to correlate this information with incidence of coliform organisms and the sanitary data; and to classify the streptococci isolated, and determine their resistance to chlorine.

Tests were made during the summers of 1942 and 1943. At those times the junior author was engaged in the inspection of all pools in Kansas while employed by the State Board of Health, thus affording an opportunity for the collection of samples under actual operating conditions. The data collected

can be compared as to type of pool, equipment and operation, chlorine residual and pH at the time the sample was collected, and bacteriological quality.

In the course of the routine inspection of the pools, samples of water were collected and shipped to the State Water and Sewage Laboratory where colony counts and the determination of coliform organisms were made according to Standard Methods.⁶ At the pool-side, samples to determine the presence of streptococci were taken by adding 10 ml. of the water to a bottle containing 10 ml. of double strength sodium azide medium. It immediately neutralized the free or combined available chlorine that might be present.

The medium has the formula:

| | Per cent |
|--|-------------|
| Proteose peptone No. 3 | 2.0 |
| Dextrose | 0.1 |
| NaCl | 0.5 |
| Sodium azide | 0.02 |
| pH 6.8-7.0 Sterilize in the autoclave | |

It supported a luxuriant growth of all the strains of streptococci and staphylococci tested. They included the hemolytic strains Lancefield's Groups A, B, C, D, E, F, G; *Streptococcus viridans*; *S. salivarius*, *S. fecalis*, *Staphylococcus aureus*, and *S. Albus*. With samples of swimming pool water and of similar mixed flora, coliform organisms and other rod forms did not develop. The medium has been found useful for the isolation of streptococci and staphylococci from a variety of sources, such as from waters both heavily polluted and of good quality, and from skin, nasal, and throat swabs.

For use in the survey here reported, the medium was prepared in double strength. Bottles inoculated in the field were shipped or carried to the laboratory where they were incubated at 37° C. Growth was indicated by turbidity and appeared in 1 to 3 days in 80 per cent

of the cases, rarely as late as 7 days. Negative samples remained clear and were incubated from 10 to 14 days before being discarded.

Samples showing growth in the sodium azide medium were streaked on plates of proteose No. 3 hemoglobin agar, from which colonies were picked for further study. Only Gram-positive cocci developed in the sodium azide medium. In the majority of cases, there was one strain of streptococcus alone; occasionally there were two strains, and in 33 cases out of 107 examinations of turbid samples a staphylococcus was present either alone or with a streptococcus. Contaminations, which were from spore-formers, were rare and were observed only after prolonged incubation of the primary sample.

Ninety-two different pools were inspected and 179 samples collected during two summers. Forty-nine pools were the fill-and-draw type, which is generally unsatisfactory from a sanitation standpoint as it is difficult to maintain the water in good physical condition and with a constant chlorine residual. Forty-three were recirculating pools, which give better opportunity for control of water quality.

The difference in pool type was clearly reflected in the bacteriological analyses. Of 88 samples from fill-and-draw pools, 28, or 31.8 per cent, showed the presence of coliform organisms; of 91 samples from recirculating pools, only 4, or 4.4 per cent, showed coliforms. For streptococci, of the 88 samples from fill-and-draw pools, 55, or 62.5 per cent, were positive as contrasted with 22, or 24.2 per cent, of the samples from recirculating pools. For staphylococci the corresponding figures were 6.8 and 29.7 per cent respectively.

Coliform organisms were present 36.4 per cent of the time when streptococci were recovered, and only 3.9 per cent of the time when they were not found. Staphylococci were isolated 27 times

from pools negative for streptococci and 6 times from streptococcus-positive samples. They might have been present and overgrown or overlooked in other streptococcus-positive samples.

No chlorine was present at the time of collection of the sample in 67.5 per cent of those showing streptococci and in only 23.5 per cent of the samples negative for these organisms. In the cases with chlorine present, orthotolidine readings showed that free available chlorine was present in amounts varying from 0.05 p.p.m. to 0.8 p.p.m., or combined available chlorine in amounts from 0.4 p.p.m. to 0.8 p.p.m.

Certain of the pools are outstanding for excellence of equipment and operation and are eligible for special certification by the rules of the State Board of Health. The results of 26 analyses from 11 certified pools showed that the pool water was in acceptable condition, as coliform organisms were not found; residual chlorine was present each time, although only 10 times did it reach the required 0.4 p.p.m.; and the pH was in the correct range. Yet streptococci were found 3 times and staphylococci 8 times in the 26 tests.

In studying the streptococci recovered, use was made of the tests outlined by Sherman⁹ as determining the primary divisions of the genus. They include determinations of hemolytic type by Brown's²⁸ method; growth at 45° C. and 10° C.; in broth containing 6.5 per cent sodium chloride; in broth adjusted to pH 9.6; in milk containing 0.1 per cent methylene blue; and in milk to observe strong reduction of dye. The serological grouping by the Lancefield²⁹ precipitin test was determined for a part of the cultures, as was colony type on agar containing 5 per cent sucrose.³⁰ As a basis of comparison for the study, five known cultures were included: *Streptococcus pyogenes* and *S. zymogenes* which were Lancefield Group A and Group D respectively; *S. fecalis* from

a stool culture; *S. salivarius* from saliva and another organism of the viridans division isolated from a normal throat. The results of these tests are shown in Table 1, in which strains showing similar characteristics are grouped together.

Morphologically the organisms isolated in the survey were Gram-positive cocci grouped as pairs and in short chains. The biological characteristics class them as enterococci. Of the 79 strains studied, 52 showed biological reactions typical of *S. zymogenes* and *S. fecalis*. Twenty-six strains showed variations from the control enterococcus cultures as follows: 3 strains did not grow at 10° C. and 6 at 45° C.; 6 did not develop in alkaline medium; 9 would not tolerate 6.5 NaCl; 16 failed to grow in 0.1 per cent methylene blue, and 23 were negative for strong reduction.

Studies of hemolytic type were interesting but of no great value in classification. In poured plates of horse blood agar, no colonies showing the beta type of hemolysis were observed among the cultures isolated. Seventy-two of the 79 strains produced the alpha prime type of hemolysis. They exhibited considerable variation as to width and completeness of the hemolytic zone produced, width and darkness of the zone of red blood cells around the colony, time of appearance of the characteristics, and amount of change during the succeeding periods of incubation and refrigeration. Seven cultures showed alpha hemolysis; the 6 of them classed as enterococci were in the groups atypical for biological characteristics.

All of the cultures grew abundantly on proteose No. 3 hemoglobin agar. Strains typical of *S. fecalis* formed opaque colonies 1 mm. in diameter. A smaller number of strains from the atypical group produced a distinct green coloration, differing in amount and in time of appearance.

The precipitin reaction by the

Lancefield technique was determined for 33 of the cultures. Of these, 27 were typical enterococci and read as follows: 17 Group D; 7 cross-reactions for Groups D and K; 1 for Groups D and G; 1 for Groups G and K; and 1 gave no precipitate. Six of the atypical strains were tested and gave no precipitate. Only 1 strain showed the reactions of a streptococcus of the viridans division. It produced the alpha type of hemolysis, grew at 45° but not at 10° C., reduced methylene blue slowly, was negative in the tolerance tests, and did not produce mucoid colonies on 5 per cent sucrose agar. No strains of *S. salivarius* were found

in the group studied. That this organism was recovered from three pools is suggested by preliminary tests of cultures that did not survive storage long enough to be classified. Later studies of 17 samples from a single recirculating indoor pool yielded *S. salivarius* twice and atypical enterococcus strains three times. In many of the 179 analyses, chlorine residuals were adequate. Streptococci were isolated once from water having 0.5 p.p.m. free chlorine and a pH under 6.8; once with 0.4 p.p.m. residual and pH 7.6; and once with 0.8 p.p.m. combined residual chlorine and pH 7.6. Staphylococci were found in the presence

of 0.5 p.p.m. and 0.1 p.p.m. free chlorine, and 0.8 p.p.m. combined chlorine.

The resistance of various organisms to free available chlorine is important in swimming pool control. Therefore, chlorine tolerance tests were made for 11 of the strains of streptococcus isolated from pools in this study, 5 control strains of streptococcus and 1 strain each of *Escherichia coli* and *Aerobacter aerogenes*, isolated from untreated surface water, and of *Staphylococcus* 209, the F.D.A. strain used for testing disinfectants. Tests were made in chlorine-free, chlorine-demand-free water after the method of Butterfield and coworkers,³¹ and the free available chlorine was checked by the orthotolidine-arsenite method of Hallinan.³²

In Table 2 are presented the results of tests made at room temperature in distilled water buffered to a pH of 7.0 to 7.2. Comparing a series in which the chlorine content was 0.6 p.p.m. at the beginning of the experiment and not less than 0.4 p.p.m. at the end, it is

shown that under those conditions the control strains of beta hemolytic streptococci, Group A and Group D, were killed almost immediately. The control strain of *S. fecalis* survived 1 hour but not 1½ hours. Of 7 similar strains isolated from pools, 3 survived an hour or more and only 1 was killed in less than 5 minutes. The 4 atypical enterococcus strains survived from 5 to 30 minutes. *S. salivarius* survived 5 minutes but not 10 minutes; another control strain of the viridans group survived 30 minutes. *Staphylococcus* 209 survived 30 minutes. *E. coli* and *A. aerogenes* were killed almost immediately, none surviving 5 minutes' exposure.

A more limited experiment of the survival of these organisms in chlorine-free sterilized tap water showed that a Group A streptococcus survived 1¼ but not 4 hours. *S. salivarius* survived for 4 but not 7 hours. The enterococci, both typical and atypical strains, survived 12 hours or longer, 1 strain being present after 4 days. Three strains of

staphylococci survived for 7 but not 12 hours.

A later study on a recirculating pool demonstrated the fact that proper chlorination will control the organisms present. From a sample collected one morning containing no chlorine, coliforms, staphylococcus, and 1 strain each of *S. salivarius*, and an atypical enterococcus were isolated. Chlorination was started and by the time the free residual chlorine had reached 0.4 p.p.m., the streptococci and coliforms had disappeared. The pool was in use during the day; staphylococci were isolated at intervals, but disappeared after a longer period of chlorination.

The presence of coccus forms on the skin of the potential bathers was also investigated. Thirty-one cultures from 18 persons were made by rubbing small areas in the cubital, axillary, perineal, and inguinal regions and the abdominal area with moist sterile swabs which were then incubated in tubes of sodium azide broth, from which isolations were subsequently made. Staphylococci were recovered from every swab (37 strains). Streptococci were recovered every time from the perineal region and 3 times, with 5 strains, from 10 swabs from the inguinal region. Of the 22 streptococcus strains thus isolated, 10 could be classified as *S. fecalis*, 10 as atypical enterococci, and 2 as *S. salivarius*. None of the strains of staphylococci isolated showed the characteristics of pathogenic strains.

SUMMARY AND CONCLUSIONS

It is noteworthy that no streptococci of the beta hemolytic type were isolated in this study. That they will grow readily in the primary medium used was demonstrated in the laboratory. Their low resistance to free available chlorine indicates that they would survive but a short time after being introduced into a properly chlorinated pool.

Of 79 strains of streptococci isolated

from swimming pools, 52, or 65.8 per cent, can be classified as *Streptococcus fecalis*. Their ability to grow under adverse conditions—provided by high and low temperatures, alkaline medium and high salt content—seem consistent with their high rate of survival. This is also shown by their resistance to chlorine, as strains picked at random were resistant to 0.4 to 0.6 p.p.m. free available chlorine from 30 minutes to 1 hour, under the conditions of the test.

Twenty-six strains were similar to *S. fecalis* in only part of their characteristics. They may be considered as more closely related to the enterococci than to any other division of the streptococci. Tests for the temperature limits of growth and for growth in alkaline medium were found to be the most reliable in classifying the enterococci.

Typical *S. fecalis* strains were classified as Type D by the Lancefield technique; atypical strains could not be typed.

That *Streptococcus salivarius* may be present in swimming pool water would be expected. No strains were recovered in this survey, although their presence was suggested by the preliminary tests from three pools. This organism was shown to be killed by 0.4 to 0.6 p.p.m. free available chlorine in 10 minutes or less.

In 179 analyses from 92 swimming pools, streptococci were recovered 83 times, and coliform organisms 32 times.

Pools equipped for recirculation and continuous chlorination of the water were shown to be superior to pools of the fill-and-draw type from the viewpoint of water quality.

From the results of this work, it can be concluded that a standard requiring the absence of streptococci from swimming pool water is more stringent than that requiring the absence of coliform organisms. And it is our opinion, based on public health experience, that this additional requirement is not necessary.

The Origins of Public Health in the United States

JOHN B. BLAKE
Cambridge, Mass.

DURING the second half of the 19th century the United States changed from a predominantly agricultural and rural to an industrial and urban civilization. The rise of the city forced upon the attention of the American people many problems which previously they had largely neglected; among these was public health. Spurred by social necessity and motivated by humanitarian idealism, economic and life-saving benefits, and increased popular faith in the value of science, public health officials and public spirited laymen advanced municipal public health practices from almost nothing to a vigorous and useful function of local government.

Prior to the Civil War sporadic attempts were made to protect the public against infectious diseases by governmental action. Massachusetts Bay Colony, for example, set up quarantine regulations as early as 1647 when news arrived of a "great mortality" in the West Indies.¹ Petersburg, Va., set up what was probably the first board of health in 1780, and New York, Baltimore, and Boston took similar action in the 1790's.² The outstanding *Report* of the Massachusetts Sanitary Commission in 1850, resulting from a survey undertaken by Lemuel Shattuck, reviewed the past history of sanitation and envisaged a remarkably comprehensive system of state public health administration far in advance of its time.³ In 1857 Wilson Jewell of the Philadelphia Board of Health arranged the first of four annual meetings of the National Quarantine and

Sanitary Convention,⁴ but this promising organization was discontinued when the Civil War broke out. In the field of infectious diseases, effective methods of smallpox prevention, though not widely applied, had slowly been developed: inoculation and, later, vaccination had long been striving for recognition, and in addition laws requiring quarantine, notification, isolation in "pesthouses," and disinfection had found their way into the statute books and city ordinances. But despite these glimmerings of future light, little had in fact been actually accomplished prior to the Civil War. Typical was the board of health organized in New Haven, Conn., in 1806: it confined itself largely to matters of quarantine and nuisance removal; in some years when the town was generally healthy, it did not bother to meet.⁵

Meanwhile, in England where the advent of the Industrial Revolution in the 18th century was already posing problems of urban health, steps were being taken which were to have a great influence on the United States. In London, effective legislation to end the gin drinking menace in 1751, improved care of parish children, extension of medical practice among the poor, together with street paving, better drainage and scavenging, and increased water supplies helped to lower the death rate markedly.⁶ More significant were the investigations initiated in 1838 by Edwin Chadwick, a member of the British Poor Law Commission, on the relations of poverty and disease, culminating in the famous *Gen-*

eral Report on the Sanitary Condition of the Labouring Population of Great Britain in 1842. Presenting a picture of the filth and degradation of the city poor, Chadwick blamed their high mortality rate directly on "atmospheric impurities produced by decomposing animal and vegetable substances, by damp and filth, and close and overcrowded dwellings." He further declared that, when such conditions were removed "by drainage, proper cleansing, better ventilation, and other means of diminishing atmospheric impurity," epidemic and endemic diseases were abated or disappeared.⁷ Pointing out the economic and moral value of good health, Chadwick recommended sewerage, refuse removal from houses and streets, and better water supplies. Placed before Parliament, this report led to a series of investigations and acts which gave England by 1848 a public health administration superior to anything the United States was to achieve for many years.⁸

In the United States, 1865 marks the date of an epochal step. In that year the Citizens' Association of New York investigated sanitary conditions in the city, and blamed the high death rate from preventable disease in large part on the lack of any satisfactory health organization. Primarily as a result of this group's report, the New York Metropolitan Health Law in 1866 established a board with wide powers, and its success in dealing with a cholera threat in its first year of existence greatly helped to consolidate public support.⁹ Other cities, too, were founding or reorganizing their boards, and by 1890 it was exceptional for any city to lack one.¹⁰

Until the 1880's action taken by these boards was based largely on the etiological theory implicit in Chadwick's report of 1842. Despite the pioneer research of a few men such as Peter Ludwig Panum and John Snow, the majority of doctors in 1865 held to the

filth or "pythogenic" theory of epidemic disease causation. Although the contagious character of smallpox was generally acknowledged, such "zymotic" diseases as cholera, typhoid fever, yellow fever, and diphtheria were attributed to "miasms" or minute particles of morbid matter entering the body through the lungs. Decaying and decomposing organic matter was thought to be their chief source, and the belief was backed up by epidemiological evidence. On the basis of these assumptions, public health groups recommended certain procedures whose chief feature was environmental sanitation. Against diseases like cholera, typhus, and typhoid the methods were helpful and the theory was reinforced. Since the supposed miasms entered the body with the breath, the first requisite for healthful living was thought to be pure air. The obvious solution was to equip houses with good ventilation, to clean up streets and alleys, to remove refuse, to construct sewerage, and to provide a pure and plentiful water supply, essential to cleanliness. Proper drainage was considered of vital importance to prevent the production of miasms in moist soil, and the advocates of street paving received support from health officials anxious to prevent contamination of the soil.

In line with this theory, American cities developed their water supplies extensively. In Boston the first "Water-Works Company" was set up in 1652, the first important one in 1848. The first Croton water entered New York in 1842. In 1825 a total of 32 water works were in operation; in 1865, 162; in 1880, 598; in 1890, 1,878.¹¹ But while the quantitative aspect of the water-supply problem was being solved during the period from 1860 to 1890, the etiological criterion of decaying organic matter fostered by the pythogenic theory of disease led to a widespread and unfortunate belief in the self-purification of running water. Except for taste, color, odor, and

clarity, chemical analysis to determine the amount of organic matter present was ordinarily the sole test of the purity of water, while filtration, except to make the water more palatable, was neglected. The technique in vogue had some value, of course, since a large amount of sewage increased the amount of organic matter and the danger of water-borne diseases, yet the two were not necessarily interrelated. Extensive dilution and oxidization of organic material meant that a comparatively short distance below a sewer outlet there might be, so far as chemical tests could indicate, nothing to fear from a river which actually contained infectious bacteria, while the danger from an isolated case of typhoid on a thinly inhabited watershed was completely passed over. Thus it was that in 1873 the president of the New York Board of Health, a chemistry professor at Columbia, advocated lakes or rivers for city water supplies, declaring that, "although rivers are the great natural sewers, and receive the drainage of towns and cities, the natural process of purification, in most cases, destroys the offensive bodies derived from sewage, and renders them harmless."¹² There was, in fact, an increased use of rivers and lakes in preference to wells for water supplies, though convenience rather than medical theory was probably the chief reason, and some attempts were made to decrease pollution. In Massachusetts, for example, an act of 1878 forbade pollution within twenty miles of any water intake.¹³ While Chicago continued to use Lake Michigan for both water supply and sewage disposal, in 1867 it began drawing some of its water through the first of several tunnels extending out under the lake.¹⁴ These steps were exceptional, however, and the use of sewage-polluted rivers was common, while several cities besides Chicago—Milwaukee, Duluth, Buffalo, Cleveland, and others—drained their sewage into the same lake from which

they drew their water.¹⁵ In 1883 a group of Philadelphia citizens complained that the city water, mostly drawn from the Schuylkill River without any purification, was at times so bad that it was "not only distasteful and unwholesome for drinking, but offensive for bathing purposes."¹⁶

According to the pythogenic theory, adequate sewerage was no less important to good health than a pure and abundant water supply. Fearing the emanations from decomposing organic matter as progenitors of zymotic disease, the miasmatisists advocated drainage to get rid of human filth and household and industrial wastes. They emphasized good engineering, since leaky sewers by polluting the soil caused noxious exhalations of ground air and excessive dampness, both considered dangerous to health. Proper drainage would also get rid of the sewage quickly before putrefaction could set in. Of special concern were the much discussed effluvia released by decomposition, the so-called "sewer gas." The list of diseases which it was supposed to cause reads like an account of the therapeutic claims of the most extravagant nostrum monger. Consequently sanitary experts also deemed well designed and carefully installed plumbing essential to prevent the gas from escaping into houses. Along with disinterested publicists, plumbers and plumbing companies did their bit to make their product a panacea.¹⁷ Sewerage development, while it advanced during the 1860's and 1870's, lagged behind the increase in water supplies, since it lacked the latter's added value for fire protection and industrial use. Nevertheless, the number of urban communities with sewerage rose from only about 10 in 1860 to approximately 200 in 1880.¹⁸ Even in these cities, however, privy vaults continued in widespread use, especially in the poorer sections, and only a small proportion of the streets were sewered. In 1877 Massachusetts enacted the first

state law for plumbing inspection, but not until 1881 did Lawrence, Mass., become the first city to adopt a complete plumbing code.¹⁹ Meanwhile, beyond occasional relocation of outlets—little help to cities downstream—almost nothing was done toward proper sewage disposal.

The demand for housing reform, in so far as it was connected with the public health movement, was also inspired during the 1860's and 1870's by the filth theory of disease. All the factors which worried the sanitarians—polluted soil, bad air, and contaminated water—were multiplied by the crowded and filthy conditions of many of the dwellings of the urban poor. Overcrowding, defective drainage, malodorous privy vaults, improper refuse disposal, damp walls and wet cellars, evil working conditions, darkness, insufficient water supply, dirty and unpaved streets, and lack of bathing facilities all contributed to make the American slums prolific sources of disease. In New York, where the conditions were the worst in the nation, public spirited individuals and organizations concerned with the sanitary condition of the city and the welfare of the poor frequently agitated for reform. The Association for Improving the Condition of the Poor, a charitable society formed in 1843, took up the question in 1846. The first tenement house bill, product of two legislative commissions in 1856 and 1857, contained some able provisions but failed to pass. An investigation by the Citizens' Association in 1865 brought on the first tenement house law two years later. Under its authority the board of health in 1869 ordered 46,000 windows cut in dark rooms, but it soon became apparent that the law was inadequate. Further agitation and investigation brought a new law in 1879 which made matters worse, if anything, by establishing the "dumb-bell" tenement with its narrow, noisome airshaft. The discretionary power given the board of

health to dispense with certain good features combined with an insufficient inspection force to give powerful landlords the opportunity virtually to nullify the law.²⁰

In relation to water supplies, sewerage, and housing, the pythogenic theory, when applied, proved helpful, but its inadequacy was effectively demonstrated during the frequent yellow fever epidemics which swept the South. As late as 1877, Henry M. Lyman, a professor at Rush Medical College, declared that while yellow fever could be imported and spread by contagion, it originated from a miasm formed by the decomposition of warm, moist human filth and thus could arise spontaneously wherever such conditions prevailed.²¹ In the epidemic year of 1878 the American Public Health Association devoted almost its entire meeting to this problem. The majority had by then come to believe that the disease was in some manner contagious, though of course the method of transmission was as yet unknown.²² Courageously if somewhat naively, in view of the commercial implications, Samuel Chopin, president of the Louisiana Board of Health, recommended absolute non-intercourse from April to November with ports where yellow fever was indigenous.²³ The following year, however, the merchants of New Orleans founded a voluntary sanitary organization whose activity was concerned almost entirely with environmental sanitation,²⁴ and the epidemic prompted Memphis to organize an efficient board of health and to build a sewerage system and water works.²⁵

Although the filth theory of disease remained the most prevalent basis for public health activity during the 1870's, it was already undergoing modification by the influence of new theories developed by European medical research. The theory of contagion had, in fact, never been completely discarded. Quarantine and to a lesser extent isolation continued to be used for many diseases

besides smallpox. Moreover, certain epidemiologists were laying a firm basis for the development of the contagion theory. Peter Ludwig Panum's study of measles in the Faroe Islands in 1847, John Snow's publications on cholera in the 1850's, and William Budd's work on typhoid fever beginning in 1856 indicated clearly the communicable nature of those diseases. To put the control of epidemic disease on a firm basis, however, the contagion theory had to be conclusively established by the germ theory of disease. In the 1850's Louis Pasteur began his studies of fermentation. Further milestones came in 1870, with the publication of Pasteur's *Etudes sur les maladies des vers à soie*, and in 1876, when Robert Koch showed conclusively that a specific bacillus could cause anthrax. In the following decade, greatly aided by Koch's development of the solid culture method in 1881, new discoveries followed one another in rapid succession, definitely establishing the germ theory.

As is so often the case, the implications of the new science of bacteriology were not at first fully perceived. Nursed in the filth theory, many public health advocates began to look on decaying organic matter as a breeding ground for germs instead of miasms. Studies showing the high bacterial content of dust arising from municipal highways were used to bolster arguments for street cleaning. In 1891 a committee of the American Public Health Association reported that the lax collection of garbage was a great danger to the health of the nation, that "Heaps of garbage continue to be disease-breeders, furnishing the proper conditions for the rapid growth and development of any disease germs which may lodge therein." Man, the committee complained, goes on piling up excrementitious matter "until the earth, water, and the very air are charged with death-producing elements. . . ." ²⁶ While no one would deny that

efficient garbage collection is beneficial, the recommendations thus made were still, in effect, based on a modified filth theory of disease.

Gradually, however, the new etiological theory was more firmly grasped, and its effects became noticeable in board of health activities. For many years epidemiologists in both Europe and the United States had been publishing studies indicating that typhoid fever, for example, was often transmitted by water supplies contaminated with the excreta of infected persons. With the growth of the germ theory and the discovery of the typhoid bacillus in 1881, these past studies took on new meaning, and future investigators could direct their attention to the specific causative agent of America's most prevalent water-borne disease. A penetrating analysis by the State Board of Health of a typhoid epidemic in Plymouth, Pa., in 1885 ²⁷ helped to spur an interest already reviving among the members of the American Public Health Association and a small part of the general public in sewage-polluted water. Realization of its danger, reinforced by high typhoid mortality rates in cities using such water, provoked a discussion of new remedies and new testing methods to fit the new theory. Chemical analysis was called inadequate and use of any sewage-polluted river as a water supply condemned. ²⁸ Increasingly, American cities attempted to diminish pollution of their sources of water. In Chicago, for example, the previous policy of building tunnels continued, but it was not until 1892 that the last of the shore intakes was shut off, dropping the typhoid death rate from a high of 174 per 100,000 in 1891 to 54 per 100,000 in 1893. In addition, interception sewers were built during the 1890's to empty into the Chicago River while, despite the opposition of St. Louis, and of certain commercial interests, concerned over the level of the lake, con-

struction of a drainage canal 28 miles long served to reverse the river's flow, sending all Chicago waste down the Illinois. In 1900 the typhoid death rate reached a new low of 20 per 100,000.²⁹ In addition, new experiments were undertaken in filtration. The first important studies were at the Lawrence Experiment Station, set up by the Massachusetts Board of Health in 1887, where the slow sand method was developed. Although progress in applying this knowledge came largely after 1900, its value had already been proved in Lawrence. When an investigation showed that the city water supply, taken from the sewage-polluted Merrimac, was to blame for a severe typhoid epidemic in 1890 and 1891, a slow sand filtration plant was introduced in 1893, and the death rate from all causes fell from 24.0 per 1,000 in that year to 18.8 in 1894.³⁰

Meanwhile, the advent of bacteriology also made possible the development of greater purity in milk supplies. Although medical and scientific writers showed comparatively little interest in milk before 1880,³¹ Boston had appointed a milk inspector in 1859 to prevent the use of distillery slops as feed. It was not until the 1870's and 1880's, however, that inspection became significant, and then it was primarily directed, with more or less success, to the problem of adulteration. In the 1890's an increasing scientific interest in the problems of milk supply brought new emphasis on bacteriological purity. Koch's discovery of tuberculin in 1890 made possible accurate detection of tuberculosis in cattle, long known to exist and considered dangerous, and by 1900 several cities were requiring tuberculin tests. The first experimental bacterial counts in the United States came in Boston in 1892, and other cities followed; but it was not until 1900 that Montclair, N. J., instituted the first regular system of bacteriological examination. The movement for certified milk, inaugurated in 1892

by Henry L. Coit of Newark, N. J., greatly aided in improving production conditions in many dairies. While Pasteur and other Europeans had been working on means of sterilization since the 1860's, pasteurization was largely in the discussion stage in the United States until after 1900. At the same time certain charitable organizations and philanthropic individuals, realizing that the children of the poor who needed this food most were least able to get it, began developing infant milk depots. The first, founded in Germany in 1889, was followed the same year in the United States at the Good Samaritan Hospital in New York. Especially important was the station set up by Nathan Straus in 1893, first of many supported by his contributions. Rochester, N. Y., in 1897 was the first city to undertake municipal distribution.³²

While constant advances were being made in nearly all fields of environmental sanitation during the 1880's and 1890's, the developments in medical theory also prompted the extension and improvement of old techniques of infectious disease control long used for smallpox. In 1873 Brooklyn first required notification of scarlet fever and typhoid, and though this development was slow to spread, by 1900 32 states and many communities in others required notification of communicable diseases.³³ In 1894 Boston introduced the first regular system of medical examination of school children, followed by Chicago in 1895, by New York in 1897, and by Philadelphia in 1898.³⁴ Placarding of houses for infectious diseases became nearly universal by 1900.³⁵ Except for smallpox facilities, in 1873 New York had only two small wards on Blackwell's Island to serve as an isolation hospital, mostly for typhus, but by 1899 at least 15 of the nation's largest cities had isolation hospitals for scarlet fever, diphtheria, and other infectious diseases.³⁶ Disinfection became

so prevalent that by 1906 Charles V. Chapin termed it a "fetich."³⁷

In addition to the extension and improvement in notification, isolation, and disinfection, certain innovations were made possible by the advent of bacteriology. The most important, prior to 1900, was the introduction of bacteriological laboratories as an essential adjunct of boards of health. The first, established in Providence in 1888, proved its value that year by tracing an epidemic of typhoid fever to the city water supply. While the emphasis in this and similar early establishments was on the sanitary aspects of public health, New York in 1893 instituted the first diagnostic laboratory. The development of culture methods as the most valuable means of recognizing diphtheria caused many cities as well as states to follow this lead, and by 1900, 31 of the 40 largest cities and many smaller ones were so equipped. Although the original and principle purpose of most of these laboratories was to perform routine work in diagnosis and control of communicable diseases, some also produced antitoxins, vaccine, and tuberculin. Generously established facilities in such places as Boston, New York, Philadelphia, and Pittsburgh, provided an opportunity for original investigations and attracted able men who would otherwise have gone into state or university positions. According to the *Review of Reviews* the New York Health Department commanded "scientific talent of a high order,"³⁸ and this praise was well earned by its work in establishing the carrier principle for diphtheria. In the years that followed the laboratory, through work in controlling water, milk, and food supplies, diagnosis, and preparation of sera and vaccine, became the foundation of the public health movement in the United States.³⁹

The science of immunology, introduced by Pasteur, paved the way for another major development in the

1890's, the use of diphtheria antitoxin. Although foreshadowed by smallpox vaccination, immunology had to await the germ theory before extension to other diseases was possible. When the news of the development of diphtheria antitoxin by Emil von Behring and Shibasaburo Kitasato reached the United States, one popular news magazine commented that, "nothing else in the world's recent progress of which these pages could make note has an equal degree of interest or importance."⁴⁰ Convinced by its own investigations of the value of the new discovery, the New York Health Department, under Hermann M. Biggs, started manufacturing the antitoxin, partially supported by the *New York Herald*. Inaugurated by New York, free distribution of the cure was quickly taken up by other cities from Boston to San Francisco, from Chicago to New Orleans.⁴¹ The value of these measures was reflected immediately in the saving of life. In New York the death rate for diphtheria and croup had increased steadily from 118 per 100,000 in 1890 to 168 in 1894; the following year it dropped to 112, and in 1898 reached a low of 48 for the decade. In Boston the rate was over 100 every year but one from 1890 through 1896; in 1898 it reached a low of 35.⁴²

In the fight against the nation's greatest killer, tuberculosis, significant advances also occurred in the closing decade of the century. Development of effective means of treating tuberculosis came during the 1880's and 1890's. Deciding to test the rest and fresh air theory, Edward L. Trudeau in 1873 went to the Adirondacks where meditations on his own improvement led to the establishment of the Adirondack Cottage Sanatorium at Saranac Lake in 1884. By 1900, there were many successful private sanatoria and at least three supported by state and local governments. Meanwhile, Koch's discovery of the tubercle bacillus in 1882 demonstrated the

contagious nature of the disease. Discovery of the germ in the sputum of patients led to the belief that dried expectoration was a particularly common means of spreading infection, whether found on linen, bedclothes, handkerchiefs, floors, or street pavements. In 1890 New York City began issuing the first pamphlets giving information on the contagious character of the white plague and on means to prevent its spread, and by 1894 was conducting an intensive campaign of prevention, emphasizing education. Soon the Department of Health was distributing 20,000 to 30,000 circulars a year to physicians and tenement house residents where the malady thrived on crowded conditions. By 1899, 22 state boards of health and many other cities had adopted this practice. New York also introduced enforced disinfection and renovation of infected premises. In 1896 the city passed the first anti-spitting regulation in the United States. The following year New York became the first to require notification of tuberculosis.⁴³ The results of this fight against the white plague were markedly reflected in the death rates. In New York it dropped from 362 per 100,000 in 1890 to 257 in 1900; in Boston from 333 to 222; in Philadelphia from 264 to 210; in Chicago from 179 to 153.⁴⁴

The campaign against tuberculosis also marked the first extensive use of another valuable weapon in the hands of health officers, education in personal hygiene. They had long recognized the importance of popular support, and the American Public Health Association had worked valiantly to spread knowledge. Most of this, however, was propaganda to convince the public of the general need for sanitary measures in order to gain support for boards of health and to promote cleanliness. Since the 1870's, there had been pleas in lay as well as scientific periodicals for instruction in physiology, hygiene, and sanitary science in public schools. Early efforts, as

far back as 1850 in Massachusetts, to introduce such subjects into the curriculum were largely abortive, but renewed attempts in the 1880's proved more successful. Unfortunately, however, most of the resulting legislation came from the pressure of temperance and similar organizations, and the teaching was specifically directed at the effects of alcohol and tobacco. According to one member of the American Public Health Association, most of the textbooks were "unfair, unscientific, and untruthful."⁴⁵ While some of the other publicity given to the public health movement was invaluable, it was in the field of tuberculosis prevention and cure that there occurred the first significant dissemination of information on specific methods of controlling communicable diseases. This technique was to become of increasing importance during the 20th century.

One of the valuable aids to the development of education, public health nursing also saw its first beginnings during this period. The first modern district nursing association was founded in 1859 by a Liverpool philanthropist, William Rathbone, with the coöperation of Florence Nightingale. The movement reached this country with the formation of a similar organization in 1877 by the Women's Board of the New York City Mission. In 1886 the Instructive District Nursing Association was established in Boston, the first to include education in personal hygiene as a definite objective. By 1900 there were 58 organizations engaged in public health nursing employing 130 nurses. Again, the impetus had been given for a far greater development in the present century.⁴⁶

In contrast to the movement for environmental sanitation, the development of bacteriological laboratories and of new methods of treating diphtheria, tuberculosis, and other communicable diseases owed comparatively little to

non-professional humanitarian organizations. Especially in New York where the far-sighted administration of Hermann M. Biggs set an example for the world it was the big city health officials and their professional colleagues that led the way. Several reasons combined to bring about this change. The health officers were in a better position to realize the importance of new developments in medical science. Writing in 1900, Chapin declared that "public sanitation in the popular mind consists chiefly in the removal of nuisances,"⁴⁷ and even among many sanitarians the filth theory of disease still seemed, for all practical purposes, to hold first place. While the New York department was making its epochal researches in the control of diphtheria, a writer in *Scribner's Magazine* charged it with "pottering" with tenement house reform.⁴⁸ Another factor was that these new activities were less likely to raise specific opposition. While a bacteriological laboratory could be set up fairly cheaply, and rarely injured important private interests, a new water works was expensive and changes frequently represented the virtual loss of a considerable investment, often of private capital. Tenement reform especially was opposed by vested interests. A third reason was the increased faith in the value of science arising in part from its more widespread teaching in the colleges and high schools but still more from its many successes in medicine and other fields. In addition, the idea of a social service state, though still in its infancy compared to today, was gaining in popularity. Not only were some men attacking the predominant belief in *laissez faire*, but tax supported schools, libraries, and fire departments—all of which developed extensively in the years following the Civil War—were akin to tax supported public health. Though the activities of the federal government in public health were slight, it was supporting scientific research in other fields with

the establishment of the U. S. Geological Survey and the Bureau of Ethnology in 1879. Humanitarians had accustomed many to the idea of using government to effect their reforms. By the 1890's the boards of health had proved their value and were securely established as part of American municipal administration. No longer under the compulsion of trying to get the authority to make rules for health, they were able to use their power, and, together with their professional colleagues, to lead the way in the public health movement. Nothing else shows more clearly the advance which New York had made since 1865, when a group of private citizens had to give the impetus to the formation of the health department.

In the 1860's and 1870's the need for environmental sanitation and adequate administrative powers had been emphasized. During the 1880's and 1890's these became generally recognized, received widespread support, and developed rapidly. By 1900, there was much room for improvement left: many wells were still used for water supply; sewerage was often inadequate; housing of the urban poor was execrable; refuse removal was often neglected. Yet great strides had been made and the need for remedial action was firmly established in the public consciousness. Civic-minded organizations were demanding cleanliness, and in 1901 New York passed the first effective tenement house law. In many cities the administrative details had already passed out of the purview of boards of health into the hands of various departments especially organized to cope with them. In the 1880's the implications of new medical theory were beginning to reach public health experts, and during the 1890's were producing significant results. In the developments deriving from bacteriology a sound start had been made toward pure water and milk supplies and toward the control of infectious diseases

through increasing application of the techniques of notification, isolation, and disinfection, and by development of laboratories, diphtheria antitoxin, and education in personal hygiene. Much lay ahead in all these fields.

Problems of rural health, mobilization of the physicians of the community to aid in public health, care of chronic and constitutional diseases, and industrial hygiene had as yet received little attention. But by 1900 the public health movement, virtually nonexistent in 1860, was firmly established, and had proved its value in lowering the death rate of the nation.

Appraising a Medical Care Program*

SEYMOUR ETKIN

Economist, U. S. Bureau of the Census, Washington, D. C.

PREPAID medical service is a subject about which there is much misconception and bias. This article is based on a study of the operations of the Group Health Association of Washington which recently celebrated its 10th birthday. In this article certain standard approaches as well as some novel approaches are used in appraising the adequacy of a medical care program.

THE MEDICAL STAFF

As of September 1, 1947, the number of full-time medical staff members was distributed as follows:

| | |
|---|----|
| Department of Adult Medicine | 5 |
| Department of Obstetrics and Gynecology | 3 |
| Department of Pediatrics | 4 |
| Department of Otolaryngology | 1 |
| Total | 13 |

In addition, there were a general surgeon on a retainer basis and 9 specialists on part-time or referral basis in the fields of internal medicine, allergy, dermatology (2), neurology, orthopedic surgery, roentgenology, urological surgery, and ophthalmology. These 9 specialists together contributed services equivalent to the full time of 3 physicians.

The full-time medical staff or equivalent is, therefore, 17 (13 plus 1 plus 3).

The auxiliary medical and administrative staff, as of September 1, 1947, consisted of the following:

- 1 Optometrist
- 3 Pharmacists
- 15 Registered Nurses
- 3 Practical Nurses
- 7 Laboratory, x-rays, and optical technicians
- 39 Business and administrative employees

For each physician operating in Group Health Association's prepaid medical care plan, there were approximately 4 staff members lending direct or indirect assistance.

As stated above, the number of physicians on G.H.A.'s medical staff on September 1, 1947, was the equivalent of 17 full-time physicians. The membership on that date was 12,806 participants. The ratio of physicians to member-participants was, therefore, 1.33 for each 1,000 member-participants. This ratio can also be expressed as follows: there was 1 physician for each 752 member-participants.

A ratio of 1.29 physicians per 1,000 population is generally considered adequate to provide medical care. G.H.A.'s ratio of 1.33 per 1,000 participants, therefore, compares favorably to the ratio deemed necessary for adequate medical care.

A survey of the number of physicians in relation to population in the District of Columbia showed that on June 1, 1947, there were 637 persons per physician, or a ratio of 1.59 per 1,000 persons. However, the whole metropolitan area constitutes one medical trade region with Washington, D. C., as its center. When data for the counties of Montgomery and Prince Georges, Maryland, and Arlington County and the City of Alexandria are added to those for the

* Adapted by the writer from his thesis, "A Study of Group Health Association: A Survey of the Operation of a Prepared Medical Care Program in the District of Columbia," written as a partial requirement for an M.A. degree in economics at the American University, Washington, D. C.

District of Columbia, the number of persons per physician is 762, or 1.31 per 1,000 population.¹

G.H.A.'s physician-participant ratio is slightly lower than the physician-population ratio for the District of Columbia and about the same as that for the whole metropolitan area.

The full-time and part-time medical staff members receive a monthly "salary," though the Business Manager of G.H.A. made it clear in conversation with the writer that G.H.A.'s doctors are not "employed" by the Association but are on a "contract basis" with the Association. (This distinction is made to show that G.H.A. is not engaged in the practice of medicine but merely to provide the arrangements under which doctors may practise medicine.) The general surgeon is paid a yearly stipend, in return for which he* performs all the major surgery required for G.H.A. members. Two physicians, the urological surgeon, and the ophthalmologist, are paid for each case referred to them by the Medical Director.

All members of the medical staff are fully licensed in the District of Columbia. Many have also been licensed in other states, and a few have been trained in foreign countries.

Six of the physicians are certified in their specialties, i. e., they are either diplomates in their specialty or are Fellows of the American College of Surgeons.

For all physicians on G.H.A.'s staff, the average number of years in which they had been engaged in medical practice as of September 1, 1947, was 12. If service in the armed forces is omitted, the average is computed as 11. (In both cases service as an interne was not counted toward medical practice, but service as a resident physician was so credited.)

The average age of the physicians in adult medicine (general practitioners) was 34. (Age was computed to nearest birthday as of September 1, 1947.) The average age of all physicians on the staff was 40.

G.H.A.'s specialists are older, on the average, than its general practitioners. In the District of Columbia on the whole, however, general practitioners are older, on the average than the specialists.

Physicians for the staff are partially recruited through advertisements in the *Journal of the American Medical Association*. In addition, recommendations for appointment are made to the acting Medical Director (Chief of Pediatrics) by persons who have knowledge of the interest of doctors wishing to become connected with a prepayment medical care organization. After screening by the acting Medical Director, the candidate for appointment to the staff is interviewed by the Medical Executive Committee and approved or disapproved by that committee.

G.H.A.'s promotion and publicity manager states that the inducements to work on G.H.A.'s medical staff are as follows:

Attractive salaries (\$4,300 to \$12,500 per year depending on experience and specialty)

Freedom to practise medicine (i. e., no worry about hiring nurses, bookkeepers, etc.)

Liberal conditions:

Annual leave, 30 days per year

Study leave, 30 days per year

Sabbatical leave, 1 year in 7

Availability of up-to-date equipment

Group practice and consultation

No need to consider pocketbook of patient when recommending referral to specialist or x-ray or laboratory tests.

PATIENT LOADS

During 1946, each G.H.A. doctor had, on the average, about 17 consultations per day while he was at G.H.A.'s offices. A clinic day was slightly longer than 7 hours in length. Like most averages, 17 consultations per clinic day per doctor do not tell the whole story. There were

* Actually the general surgeon and his associate both perform the surgical operations. G.H.A.'s contract, however, is with the senior surgeon only.

TABLE 1
Patient Loads by Department Group Health Association 1946

| Department | Total Number of Clinic Visits | Doctor Days on Clinic Duty | Visits per Doctor per Day on Clinic Duty |
|-----------------------|-------------------------------------|-------------------------------|--|
| General Medicine | 13,422 | 994 | 13.5 |
| Obstetrics | 5,466 | 250 | 21.9 |
| Pediatrics | 10,131 | 548 | 18.5 |
| Allergy | 870 | 57.4 | 15.0 |
| Neurology | 353 | 52 | 6.8 |
| Dermatology | 2,151 | 46 | 47.0 |
| Roentgenology | (3,933)* | .. | .. |
| Orthopedics | 403 | 28.4 | 14.0 |
| Eye Department | 2,463 | 193.5 | 12.8 |
| Ear-Nose-Throat Dept. | 2,789 | 97.9 | 28.0 |
| Major Surgery | (1,553)* | .. | .. |
| All Departments | 38,053 | 2,287.2 | 18.6 |

* Not included in totals.

variations from department to department, from doctor to doctor, depending on the nature of the treatment or consultation, and the extent to which nurses, x-ray technicians, and other auxiliary medical personnel could be utilized. By departments, the number of visits per day per doctor on clinic duty is shown in Table 1.

The patient-load level in the General Medicine Department, where the largest number of clinical appointments are handled, was recognized as being relatively low and, upon recommendation of the Executive Council in the spring of 1947, the Board of Trustees accepted a change in the procedure in the handling of appointments for this department. Under this change, the "members of the medical staff in general medicine, in order to provide for a peak level of 21 patients per day . . . [modified] their

appointment schedule so that a 30 minute appointment [would be] scheduled for the initial visit in an illness, and a 15 minute appointment for succeeding visits in that illness.*

How do G.H.A.'s patient loads compare to those of physicians engaged in private practice in the District of Columbia? It is necessary to compute G.H.A.'s patient loads on a weekly basis because comparable figures for the District of Columbia are available on this basis. To determine weekly patient loads, G.H.A.'s daily patient loads were multiplied by 4, the approximate number of days per week doctors devoted to clinical consultations. A comparison of G.H.A.'s patient loads for selected departments with those of the District of Columbia is shown below, in Table 2.

* Minutes of the Board of Trustees, April 29, 1947.

TABLE 2
Comparison of G.H.A.'s Patient Loads with Those of Physicians in D. C.,
for Selected Departments

| Department | Visits per G.H.A. Doctor per Day on Clinic Duty (From column 3, Table 1) | Estimated Visits per G.H.A. Doctor per Week (Column 1 x 4) † | Average Weekly Office Patient Load for D. C. Physicians * |
|------------------|--|--|---|
| General Medicine | 13.5 | 54.0 | 64.0 |
| Obstetrics | 21.9 | 87.6 | 99.0 |
| Pediatrics | 18.5 | 74.0 | 77.0 |

* Source: Ciocco, Antonio and Altman, Isidore. A Postwar Survey of Physicians Practicing in Washington, *Medical Annals of the District of Columbia*, XVI, 10; 578 (Oct.), 1947. This survey was made in the summer of 1947.

† Physicians in general medicine, obstetrics, and pediatrics, spent an average of 4 days per week in clinical consultations at G.H.A.'s offices. This is based on a study made by the writer of time devoted to clinical consultations by full-time physicians in the above mentioned departments for September, 1947.

As seen from Table 2, G.H.A.'s weekly patient load is lower than that of physicians in general in the District of Columbia for selected departments.

The average weekly office patient load for general practitioners in the District of Columbia is also available according to age groups. This is shown in Table 3.

The average age of G.H.A.'s general practitioners was shown to be 34. Hence a more valid comparison for G.H.A.'s general medicine department would be between G.H.A.'s estimated visits per doctor per week (general medicine department) shown as 54 in Table 2, and the average weekly office patient load

for general practitioners in Washington under the age of 35, shown above as 51.

TABLE 3

*Average Weekly Office Patient Load for General Practitioners in the District of Columbia 1947 **

| Age Group (In Years) | Average Weekly Office Patient Load |
|-------------------------|--|
| All ages | 64 |
| Under 35 | 51 |
| 35-44 | 78 |
| 45-64 | 65 |
| 65 and over | 34 |

Interim Board on Preventive Medicine and Public Health

It will be recalled that an Interim Board on Preventive Medicine and Public Health was created by the Surgeons General of the U. S. Public Health Service, U. S. Air Corps, U. S. Army, and U. S. Navy, under the Chairmanship of Ernest L. Stebbins, M.D., of Baltimore for the purpose of certification of medical specialists in public health and preventive medicine from the Government Services.

At a meeting of the Interim Board on October 15 it was voted to withhold certification of specialists pending action by the Council on Medical Education and Hospitals of the American

Medical Association and of the Council on Specialty Boards in February, 1949, with the hope that the American Board of Preventive Medicine and Public Health, Inc., would be prepared to accept applications immediately thereafter. It was announced that the Interim Board had received 315 applications for certification in the Services which are now suspended for the time being with the possibility that they may be transferred to the American Board of Preventive Medicine and Public Health, Inc., when it is ready to take action. (See page 1619, this issue.)

The Use of Medical-Social Service by a County Health Department

An Account of a Demonstration in Anne Arundel County, Maryland

WILLIAM J. FRENCH, M.D., F.A.P.H.A., AND
GENEVA WISER, M.A.

*Health Officer; and Medical Social Consultant, Anne Arundel County Health
Department, Annapolis, Md.*

IDEAS regarding public health are changing. A new philosophy of health has arisen and is being rapidly expanded as new ideas are advanced and are incorporated into the structure of modern health department practices. The time when a health officer felt that he had fulfilled his duty when he had supervised the milk and water supplies and the disposal of sewage, established quarantine, and abated current nuisances, has practically disappeared, to be replaced by the much broader and more constructive concept that public health is one of the important social and educational forces in the community for the promotion of a better way of living. Sanitation and the abatement of health hazards must and do continue, but health programs are now enriched and vitalized by such services as maternal and child health, nutrition, medical-social service, mental hygiene, housing, and others. The progressive health officer is no longer satisfied that his public blindly follow the instructions he gives them; he wants them to have an intelligent understanding of the processes employed and a realization of the relationship which exists between good health and good standards of living.

No agency working for the public good is self-sufficient. This applies to the health department as well as all others. What progress can a health pro-

gram make if it ignores the relief and welfare agencies, the juvenile court, and the numerous other public and private agencies and groups interested in the welfare of the people? If the health department is to be a real force in promoting better health and better living, it must have the active coöperation of these and all agencies, and must in turn coöperate with them.

The Health Department staff in Anne Arundel County consists of a health officer and an assistant; three nurse supervisors, two nurse-midwives, and a staff of twenty public health nurses; a medical-social worker; a laboratory technician and two assistants; an x-ray technician; one dentist; four sanitarians; a secretary, and nine clerks.

The following clinic and conference services are offered:

- Maternal and Child Health
- Rheumatic Fever—Heart
- Hearing
- Speech Defect
- Mental Health
- Pediatric Consultation
- Dental
- Orthopedic
- Chest
- Venereal Disease
- Cancer Detection and Control

The Maternal and Child Health Conferences are fourfold conferences attended by prenatals, postnatals, infants, and preschool children. Primarily for well

children, mothers are included because we believe in the family unit method of approach, and because in a rural community this arrangement is the most economical from the point of view of time.

Laboratory service is furnished through a branch of the State Laboratory.

The Health Department is responsible for the School Health Program (a modification of the Astoria Plan), and for the administration of the Maryland Medical Care Program as it applies in this county. The Health Department has, in addition, a delivery service which consists in furnishing nurses to assist the physician at home deliveries, and nurse-midwives to supervise and teach and who deliver certain cases. There is an arrangement with The Johns Hopkins Hospital for the care of premature infants and hospitalization of abnormal obstetrical cases not safe for home delivery.

All of these services are tied together through nine health centers and the central office in Annapolis. Each nurse is a generalized public health nurse and carries the entire program in her district. She serves approximately 5,000 people. Through her, ill children seen in maternal and child health conferences, or discovered in the course of school work, are referred back to the family physician, to a special clinic, or to a hospital, as indicated by the doctor in charge of the conference. The home visiting is done by the same nurse who works in the conference or clinic. Some health centers have special clinics, as well as maternal and child health conferences. The health center nurse works in all of these. She receives reports of work done on her cases in clinics or hospitals located outside of her area, uses this material in her visiting or conference work, and assembles all information and records in a folder specially set up for each family unit. Thus, it is possible to open

up an extensive and attractive vista of possibilities for correction of defects. In this picture, the central office in Annapolis looms large. It is the nerve center and clearinghouse, through which local health activities are correlated and controlled. This results in much corrective work being done.

In order to enable the Health Department in Anne Arundel County better to carry out its broad philosophy of public health work, a medical-social worker was employed to serve as a consultant to any member of the staff faced with a social problem connected with his work and with which he would like some help. Through her training and experience, the social worker brings to the staff her special knowledge of people and their problems, and of skills and techniques in working with people. She also brings a knowledge and understanding of other social agencies in the community, of the services they offer and how these services can be used by the Health Department, as well as how the services of the Health Department can be integrated into other community services.

Social work is no longer concerned primarily with "the poor"; but, like public health, has widened its field and now includes a knowledge of and a concern for people's total needs, both emotional and environmental, and ways of meeting those needs. Providing the necessities of life, such as food and clothing, is important; but equally important is the manner in which a person lives emotionally in his environment. It is necessary for the child with rheumatic fever to be well housed and fed; but it is equally necessary that consideration be given to his mental and emotional well-being. Love, understanding, and security are as vital to an individual as food and clothing.

The close relationship which exists between medical and social factors in any health field is no longer questioned. To work toward bodily health alone,

without considering mental and social health, is an unbalanced and unprofitable task. For instance, the causes of malnutrition often lie in the environment. The treatment, therefore, lies not alone in giving medication to the patient but also in an educational and social approach to him and his environment. The patient with pulmonary tuberculosis who has been advised to go to a sanatorium does not go willingly unless his family life and responsibilities have been settled to his satisfaction before he leaves home. Worries about his family after he has been hospitalized may cause him to leave the institution. In dealing with any person, adult or child, suffering from a chronic illness, it is necessary not only to think of medical care but also of the patient's adjustment to his home and his environment, of his educational, recreational, and vocational needs.

The medical-social consultation service in the Anne Arundel County Health Department is not limited to any particular phase of the total service given, such as crippled children, tuberculosis, etc., but covers the entire program. Since social problems occur in all areas of health service, to limit the medical-social consultation service to only one or two phases would be confusing and limiting to the entire staff. The chief contribution of the medical-social worker is in the area of emotional and environmental factors as they relate to a health service, rather than in the area of the health service itself. The personality of the patient and his environment remain the same whether the patient has a venereal disease or a hearing defect; thus, the social approach to him is the same. We believe it is valid to give medical social consultation service on a generalized basis.

It is recognized that on any health department staff, practically everyone is working directly with people. People in general seem to expect persons con-

nected with health to be understanding and helpful; therefore, they rather freely bring a variety of social problems to the staff members. This happens in clinics where patients discuss social problems with doctors. Public health nurses going into homes would need to be blind and deaf if they did not see poor social conditions and hear about family problems. The nurse-midwives are expected to be understanding of the social problems which confront pregnant women, both married and unmarried. The physical therapist is sometimes faced not only with a twisted leg but sometimes with a twisted personality resulting from the leg. A father managing a restaurant may consult the sanitarian, when he calls to inspect, about what to do with his child who has lately been helping himself to the cash register. Even the clerks in the health department office are sometimes asked for advice on social problems!

In order to meet the requests for assistance with social problems which the members of the staff are receiving, it is helpful for them to have some knowledge of how best to do this. Any person working closely with people can do better work if he has a body of basic knowledge about people and their reactions, ways in which he can help them meet their problems, and what resources the community can offer to give additional help. This body of knowledge is, at present, particularly emphasized in the training and experience of the social worker. She has organized this knowledge, developed it, and can use it in a purposeful manner. It is in this area, then, that the medical-social worker contributes to the work of the health department.

The medical-social consultation service in the Anne Arundel County Health Department is in no way an attempt to make social workers out of the Health Department staff members. The service was established to help the staff to meet

more adequately social problems that are either intrinsically a part of the medical situation or are brought as such to the Health Department personnel. It is recognized that concern for individuals with social problems is rightfully shared by everyone in the department. In giving consultation service, careful consideration is given to the ability, training, and experience of each individual member of the staff. Careful consideration is also given to the individual case situation in order to determine if it is within the function of the staff member to handle or if it should be referred to another agency. In cases where the social situation is complicated, and where there is no resource for social help outside of the staff member, an attempt is made to arrive at some means of help in the situation. It is recognized that the medical-social consultation service is not meeting the need for long-time medical-social case work service to patients.

The medical-social consultation service is carried out by having the medical-social worker act as a consultant to any member of the staff who wishes to use the service. The staff member discusses a specific social problem with the social worker, and together they decide what seems to be the best course of action in the particular situation. This joint decision may result in various forms of action to be taken by the staff member: frequently the staff member will proceed to handle the problem himself; sometimes it is decided to refer the situation to another agency for complete service or to be carried coöperatively with the Health Department; and sometimes other decisions may be reached depending on the individual problem. The responsibility for the family, in almost all instances, remains with the member of the staff who is handling the problem, and he is free to pursue his activities, returning when he wishes further help, or according to plan.

While emphasis is placed on the consultation aspects of the service and most of the help is given through conference, home visiting by the medical-social consultant is not excluded. Occasionally, the staff member seeking consultation, or the medical-social worker, suggests that a home visit be paid in order to understand and handle the social problem better. These visits are made by the staff member and the medical-social worker together and usually occur only once, or at the most twice, on a given case. Occasionally it is decided that the medical-social consultant will interview the patient in clinic. These visits and interviews are always followed by a conference with the staff member, during which the visit or interview is discussed and a plan for future action agreed upon.

Our effort is to make this service readily accessible to all members of the staff. In order to do this, the medical-social consultant is in the central office in Annapolis every morning at a specified hour. She can be reached either personally or by telephone by anyone who has a social problem to handle with which he wishes help. Emergencies are thus handled as such. Besides this, the medical-social consultant visits each health center at least once a month for a conference with the public health nurses in the particular health center. These visits are planned according to a schedule approved by the supervising nurse who attends the conferences whenever possible. This gives the nurses an opportunity to discuss any cases which involve social problems. At the request of a nurse, with the approval of the supervising nurse, the medical-social consultant may visit a health center at times other than the occasion of the regular monthly visit.

These conferences with the public health nurses at the health centers have proved to be an important part of the program of the medical-social consult-

ant. The nurses recognize their patients as individuals and have used the medical-social consultation service freely. Without the coöperation and interest of the public health nurses, along with the rest of the staff, the service could not be effective.

Participation in the orientation of new staff members and in the educational program carried on by the Anne Arundel County Health Department is another function of the medical-social worker. When a new member joins the staff, an early conference is planned with the medical-social worker so that from the beginning of his experience, the staff member is helped to integrate the medical and social factors which will confront him in his work. Anne Arundel County is a demonstration unit for the Maryland State Department of Health and a center for field experience in public health for several universities training both doctors and nurses. It is also used for observation purposes by several national and international organizations interested in public health. Visitors and students from our own and foreign countries are frequently present. The medical-social worker contributes her specialized knowledge in social work to the education and training of these visitors and students.

It is sometimes difficult for a person not specially trained in social work to understand the policies of a social agency, and how that agency applies its policies in carrying on its work. It is true, too, that social workers sometimes do not understand the medical approach and the policies of the Health Department. This lack of understanding on the part of two agencies which should be working closely together for the benefit of individuals and the community frequently prevents these resources from complementing each other's services with a resulting loss to individuals and the community.

While for many years the staff of the Anne Arundel County Health Depart-

ment has recognized the need to work closely with other agencies and excellent relations have been maintained with them, the medical-social worker, because of her background, focuses part of her attention directly in this area. Besides being familiar with the functions and policies of the Health Department, she is familiar with the functions and policies of other agencies in the community. Because of this, she is able to suggest to members of the Health Department staff how the services of these other agencies can best be used for the benefit of individuals, and to interpret to other agencies how they can use the health services offered by the community for the benefit of their clients. Thus, she serves as a liaison person between the Health Department and other community agencies. Her position as liaison officer enables the medical-social worker to recognize better the areas where services in the community could be more closely integrated and initiate meetings between the Health Department and other agencies for the purpose of discussing and planning for better service to the people of the community.

The medical-social consultant participates in program planning and policy making of the Health Department. She is included in staff conferences and group meetings both within the agency and outside it. Since the Health Department is a social force in the community, its program must be planned so that it is acceptable to and meets the needs of the people. The medical-social worker contributes her knowledge of the community and its needs to the thinking of the group and her understanding of the social approach needed in working with people.

The medical-social consultation service, as it is being carried out in the Anne Arundel County Health Department is still in an experimental stage. It is recognized that it is not meeting the total need for medical-social case

work in the County Health Department. It is, however, meeting many of the social needs of the patients; it is bringing to the staff a knowledge of the social approach and a greater facility in using this knowledge in working with

people; it is bringing a closer and stronger relationship between the Health Department and community agencies. The Health Department staff is using the service on every program and seems to like it!

National Health Council Appoints Executive Director

The appointment of Thomas D. Dublin, M.D., Dr.P.H., as Executive Director of the National Health Council, New York City, was announced on October 11 by Philip R. Mather, Boston, President of the Council. Dr. Dublin comes to the Council from the Long Island College of Medicine, Brooklyn, where he has served for the last six years as Professor of Preventive Medicine and Community Health. He assumed his new duties on October 15 in the building occupied by the National Health Council and many associated agencies, 1790 Broadway, New York.

Mr. Mather stated that Dr. Dublin's appointment climaxed an extensive search for a qualified executive to guide the Council's expanding activities. With its membership of 23 leading national health agencies, both voluntary and governmental, the Council holds a place of leadership in the public health field. For more than 25 years it has brought together a steadily increasing number of specialized organizations working to improve individual and public health.

The National Health Council, Mr. Mather says, has adopted a broad program which seeks to stimulate the provision of adequate public health services of high quality for all the population of the United States. Currently the Council's program emphasizes the enlistment of more active participation by the public in partnership with professional workers in the field of public

health. At present it is engaged in helping local professional and citizen groups in their attempts to bring about full-time professionally staffed health departments where they do not exist and to strengthen the health services of existing departments. Another interest is the development of community health councils to bring together all interested organizations to plan for community health.

Dr. Dublin, who is a graduate of Dartmouth College and of the Harvard Medical School, received clinical training at the Boston City Hospital and at the Hospital of the Rockefeller Institute for Medical Research. He received his doctorate in public health from The Johns Hopkins School of Hygiene and Public Health, Baltimore, and served on the staff of the New York State Department of Health in administrative and research capacities. During the last several years of his residence in Greater New York he has participated extensively in the affairs of voluntary health agencies both local and national.

At the same time, Mr. Mather announced that the Rockefeller Foundation has made a grant to the National Health Council of \$225,000 to be used over a 3 year period in its program of strengthening the public health movement throughout the United States.

The American Public Health Association has been an active member of the National Health Council since the Council's establishment in 1921.

New Approach to Food Handler Training*

J. L. ROWLAND, M.S.P.H., AND JOHN H. FRITZ
*Division of Health of Missouri, Jefferson City, Mo.; and Kansas
City Health Department, Kansas City, Mo.*

WE have come a long way in the field of education; however, we have a great deal more territory to cover. In this paper we are limiting our comments and suggestions to a new approach in food handling training. Permit me to cite just one example of why we need more education in this field. I choose this example because it is one that we all come face to face with every day, and that is the little butter patty. The next time you are eating out, pick up that little butter patty, whether it is margarine or butter it does not matter, hold it up to a light so that you get the sheen on the butter, and then start counting the fingerprints that you see. The presence of fingerprints on the butter produces the same result as if the waitress or food handler who handled that butter deliberately walked up to you and stuck his or her finger in your mouth.

In education as well as other fields, there are a number of ways of approaching a problem and its solutions. I like to think of this whole thing as a wagon wheel; the hub of the wheel is the solution to the problem and the spokes of the wheel are the various ways or avenues of reaching it. Where one approach may not produce results in an instance, another type of approach may

succeed. In education, we know that people learn by repetition. That does not mean that we repeat the same thing in the same words over and over: "Mary had a little lamb, Mary had a little lamb," etc. By repetition we mean that you say the same thing but you say it in a different way. That is, you *tell them what you are going to tell them, then you tell them, and then you tell them what you told them*. You say the same things but you approach from a different angle.

Planning of the program determines the success of a food handling school. You can make the course anywhere from 2 to 8 hours long. The average runs from 4 to 6 hours. In the past, in these schools, we have tried everything, from giving door prizes to closing all the establishments in the town and bringing everyone in at once. These approaches seemed promising at the time and the thing to do. But in the follow-up we found that they were not as successful as we had previously hoped. Something was wrong, definitely wrong. We feel that our new approach to food handling training may solve many of these problems, but we do not contend for a moment that it will solve them all.

The National Sanitation Foundation recently completed a study on the I.Q. of food handlers, and their report indicates that the I.Q. of the average food handler is between the 5th and 8th grades. Not only have we had, in the

* This program has been worked out coöperatively with the Kansas City Health Department and the Missouri Division of Health. Acknowledgment is given to the Kansas City Health Department for their interest and initial art work.

past, a bombardment of too many ideas in too short a time in moving pictures and films, but they have been aimed at a higher level than that of most of the food handlers over the country.

We recommend the use of demonstrations using fluorescent material and "Blacklight" and we recommend slides. We believe in the versatility that the slides offer any teacher. With a set of good slides, preferably in color, you can rearrange the order in any way you desire, you can present them and change the patter or dialogue that goes with each slide to suit the particular group that you are addressing. You can dwell for just as long, or short a period of time on each slide as you wish. With slides and what we call "live patter" you can achieve a personal relationship between you as a teacher or speaker and the audience. We further recommend that the groups be broken down; heretofore, we have herded everyone together—cooks, bartenders, managers, soda fountain personnel, and what have you. We aim at the same objective for them all. Furthermore, each should know a little about the other fellow's job. But the waitress is not interested in the cook other than the fact that he gives her good food to serve to her customers. Nor is she interested in the dishwasher's problems or what he is doing, other than the fact that he delivers to her a clean, sanitized dish. And perhaps she is only interested in this because her customer complains, and her tips fall off. We propose that the course be called our Professional Food Handler Training Program.

We plan to train the managers, to teach them the managerial things. In addition to this we propose that the manager be given a sample of what his employees will be taught. Until we have sold the manager on accepting these ideas, we are wasting our time. It is impossible for our local sanitarians to be in each establishment 24 hours a day

or during all of their operation period. Therefore, if we train the manager on these things, we have an inspector or sanitarian on the premises during all the working time. If the manager is sold on doing the things correctly, he will see to it that his employees carry out the necessary procedures. After we have had a meeting with the managers, which incidentally will only be 2 hours for one meeting, we next meet with his waitresses for one meeting for 2 hours. Then we will take the dishwashers and the cooks, or we will take the bartenders and soda fountain personnel, teaching each group just the things that each is interested in, dealing with just their main problems. We seek to insure retention of the facts, and a vital eager interest in the subjects presented.

This new approach to Professional Food Handler Training may be divided into five main sections or groupings. They are as follows: (1) providing material which can be controlled for speed of presentation according to the need of the particular group; (2) going into bacteriology only far enough to give a working knowledge but not so far as to confuse the hearers; (3) breaking the groups up according to specific duties within the establishments; that is, operators, waitresses, bartenders, soda fountain employees, cooks, etc.; (4) stressing only those items that are most commonly found in violation and thereby getting a greater retention; (5) creating a course which is easily adapted to the group by a selection of material from a master file. The master file consists of slides in full color and this file is divided into various groupings, with a section designed just for operators and managers, another for waitresses, etc. You can choose any one group that you wish and pull that particular section out of the master file, or perhaps if you are talking to a P.T.A. group or any civic organization, you can select not only one group but any combination

of groups contained in the master file to make up your talk. You can present the material to them from the angle of what they as patrons should expect to receive—a short course or a brief review of the things that you are trying to teach the food industry. Or you can give an overall picture to the industry itself, by selecting various slides from all of the groups, in any combinations you may wish to use. This master file will give you an opportunity to establish close personal contact with the audience, as well as give you a great amount of latitude.

In addition to this material, we have a series which consists of approximately 25 slides, called the "Hands Habit" (series)—they are actual photographs of hands. These slides bring out the little habits of the hands and stress the importance of changing such habits. We have a set of actual photographs of bacteria which will be in our master file, consisting of approximately 20 or 25 slides. In addition, we are going to have separate sections in our master file of slides designed just for managers, just for cooks, dishwashers, bartenders, soda fountain personnel, and so on. The master file is not complete. At the present time we have slides for waitresses, we have the "Hands Habit" series, and we have the series on bacteriology. We have two artists working on the bartenders and the soda fountain personnel series. We have material

ready to go to work on the manager or operator series, so in due time we will have the master file complete. It is our intention to duplicate these and they will be for sale. There will be no royalty attached to them, therefore, the price should be kept at a minimum. We hope to have them available for federal, state, city, county, industry, or other use.

In Missouri we shall supply each of our districts and larger cities with copies of the master file. Suggested "patter" for each section in the file will also be provided. The district and city personnel will be called together to "brief" them on this new material and its possible uses. Following this, a state representative will visit each area having a master file to assist in working out local problems. The Professional Food Handler Training Program will be carried out on the local, county, and district levels. The state will offer training and assistance in presenting these training programs and will keep the master file alive and up to date. It will be the responsibility of the city, county, or district to carry out the "follow-up" which is just as important as the training program.

In addition to the training program and follow-up, the state advocates that a portion of this program be used for the general public and in the public schools. We must teach the public the things they should expect to receive and encourage them to demand such "sanitary courtesies."

Value of Routine Fluorograms as a Measure for Detecting Cardiac Abnormalities

Report of Findings on 14,235 Routine (35mm) Photofluorograms

GERALD BERENSON, LT.* (J.G.) (MCR) USNR

Main Dispensary, Camp Le Jeune, N. C.

A RELATIVELY new phase of preventive medicine was introduced less than ten years ago, with suitable techniques for taking routine inexpensive x-rays of large groups of the population. By photofluorography, early detection of otherwise unsuspected or asymptomatic cases of tuberculosis was made possible in mass surveys—an incalculable boon to public health. Since the report by de Abreu,¹ generally credited with the first large-scale application of photofluorography, numerous reports have appeared describing results of routine studies on thousands of people.

Although originally intended for discovery of pulmonary tuberculosis, fluorography has been mentioned as a means of finding other diseases of the chest. Several authors have listed the discovery of cardiovascular diseases with various thoracic abnormalities among the results of mass examinations taken primarily to uncover hidden pulmonary disease.²⁻⁸ The advantage of detecting heart disease on routine inexpensive film of large numbers of people is obvious. In one of the first reports on fluorograms, Beck² noted a considerable number of cardiovascular conditions, including hypertensive heart disease with widening of the aortic shadow and fusiform dilatation of the aorta, aneurisms, etc. A relative increase in size of

the chambers of the heart and abnormalities in the several cardiac chambers were found. He stated that the miniatures were extremely enlightening, particularly when made at a 7 ft. distance, the distance at which the rays are nearly parallel and the outline of the heart can be accurately related to the transverse diameter of the chest. In addition to pulmonary and cardiovascular conditions, information has also been obtained concerning skeletal disorders (dorsal spine, ribs, and clavicles), tumors, and diaphragmatic abnormalities.

Heart disease demonstrable by x-ray is rather common. If properly looked for by the interpreter during mass investigations with these small films, a more frequent detection of persons with cardiovascular disease will be the result. Some of these cases will have been completely unsuspected heretofore. In this group one would expect the maximum of benefit, socially as well as to the patient. The ability to detect cardiac abnormalities is a possibility not usually realized in the ordinary interpretation of these films. Valvular disease of the heart, hypertension, and congenital abnormalities usually result in dilatation or hypertrophy of one or more cardiac chambers; characteristic enlargement of certain portions and resultant change in cardiac contour enable one to diagnose cardiac disease by x-ray. The miniature fluorograms differ essentially from large

* Department of Medicine, Tulane Medical School, New Orleans, La.

chest plates only in size. Thus, photofluorography constitutes a valuable additional technique for discovering certain cases of heart disease. With the development of photofluorography, the inadequacy of physical examinations to detect asymptomatic pulmonary tuberculosis became apparent, particularly in induction and separation centers; the ability to discover other chest diseases such as cardiac abnormalities greatly increases the value as a supplement to mass examinations.

The cost of taking care of a case of tuberculosis in a veteran of the armed services of the United States and Canada approaches \$10,000.^{8,9} The necessary expenditure for a case of heart disease may or may not reach this amount, but because of the frequency of cardiac disease revealed in routine chest x-ray examinations, an investigation to discover cardiovascular aberrations, as well as pulmonary diseases, is certainly warranted. During the studies for tuberculosis further investigation for cardiac difficulties would well compensate for any effort put forth. The usual incidence of active tuberculosis found on several surveys approximated 1 per cent.^{4, 10-13} The prevalence of heart disease demonstrable by x-ray in this group was of a percentage significantly higher alone to have warranted the use of mass fluorography.^{12, 14} It is common knowledge that heart disease is found in a larger proportion of any given population than is tuberculosis. The early detection of tuberculosis has resulted in decreased expenses to the government. Necessarily, therefore, such early discovery of heart disease would not only be of great economic advantage but would be of inestimable value to the patient and all concerned.

REPORT OF SURVEY

Material—This survey covers 14,235 miniature films (35 mm) taken as routine fluorograms of Marine and Naval

personnel stationed at Camp Le Jeune, North Carolina, over a 10 month period from January to November, 1947; 817 were civilians applying for positions as civil service workers. The ages of the subjects ranged from 17 to 60 years; the majority were young Marines just entering military life. The younger men, by far the largest group, had been investigated previously in a similar manner. Another group was of men being released from or reenlisting with the Marine Corps, men who had not been x-rayed since their enlistment, four or five years prior thereto, and a small remainder of older men with longer service histories. (As one would expect, this latter group offered a larger amount of pathology, than of hypertensive cardiac enlargement.) A few military subjects had not been x-rayed previously. This is explained by the fact that the Navy began using fluorograms routinely on a large scale only six years ago, when equipment became available.^{10, 13} For the most part, the men were examined by x-ray since their entry into the Marine Corps. The civilian group varied markedly from the Marine personnel in that they were of an older age, men released from service, and many not considered acceptable for military life; a minority were women.

Because of the complexity of the group, no statistical inference will be made. It is not feasible to compare this group with a cross-section of civilian population, nor with the groups to be x-rayed at the next annual survey, when there may be greater stabilization of military personnel. Further, it is not a group similar to that of an induction or separation center. These subjects were of a select group, considered far above the physical status of the average population.

Method—The examinations were performed with miniature (35 mm) fluorograms. For those cases suspected of having any abnormality of the chest

CARDIOVASCULAR ABNORMALITIES

| <i>Conditions</i> | <i>No. of Cases</i> | <i>Total No. of Fluorograms</i> |
|---|---------------------|---------------------------------|
| Cardiac enlargement | | |
| Hypertensive basis | | |
| (3 civilians) | 18 | 14,235 |
| Aortic and Mitral insufficiency | 1 | |
| Abnormal cardiac contour without definite enlargement | | |
| Aortic insufficiency | 1 | |
| Mitral stenosis and insufficiency | 1 | |
| Recovered rheumatic heart disease * | 1 | |
| Coarctation of aorta (civilian)† | 1 | |
| Dextrocardia without situs Inversus viscera | 3 | |
| Funnel chest—causing picture resembling cardiac enlargement | 2 | |
| Epicardial fat pads resembling enlargement | 2 | |
| Dextro-position of aorta | 1 | |

suggesting active disease, 14"x17" film was used to confirm or rule out the impression gained from the smaller film. When indicated, the men were examined and questioned and if necessary were admitted to the ward of the dispensary for establishment of a diagnosis when possible. Certain inherent obstacles were met with just as would be the case in any study of this sort. Technical difficulties, inability to reach cases requiring further examinations, particularly civilians, and lack of facilities for carrying out

complete diagnostic or follow-up studies precluded a thorough investigation. Therefore, a few suspected cases of heart disease are not included in the results. By and large, the survey was complete. The following tables summarize the more important abnormalities diagnosed after the initial detection on fluorograms.

Numerous other conditions not listed in the above tables were found and investigated when deemed necessary. Obliterated costophrenic angles, azygos lobes, elevated diaphragmatic leaves, peripheral lung calcifications, resected ribs, cervical ribs, scolioses of dorsal spine were among the findings. Evidence of old healed empyemas, many with surgical drainage, composed a fair group of men reinvestigated. The majority of the personnel of this series was considered "healthy Marines"; studies of unexplored groups by public health departments, hospitals, and communities should reveal more productive results.

DISEASES OF THE CHEST OF A NON-CARDIOVASCULAR NATURE IN THE SERIES

| <i>Conditions</i> | <i>No. of Cases</i> |
|---|---------------------|
| Pulmonary Tuberculous lesion‡ | |
| a. Far advanced tuberculosis | 1 |
| b. Moderately advanced tuberculosis | 4 |
| c. Minimal tuberculosis | 5 |
| Mediastinal tumors | 2 |
| Bronchiectasis | 1 |
| Bronchogram (lipiodol instillation previously). | 1 |
| Fractured first rib | 2 |
| (one resembled a tuberculous lesion requiring lordotic views for differentiation from an intrapulmonic defect). | |
| Enlarged mediastinal shadows | |
| Mediastinal lymphadenopathy | 2 |
| Sarcoid (?) (civilian) | 1 |
| Miliary calcifications— | 3 |
| (Histoplasmin (+) and tuberculin (—)) | |

* This patient gave a history of having rheumatic fever associated with "murmurs and heart enlargement," being ill for a period of 4 months about 1 year before his fluorogram was taken. Physical examination was negative and further x-rays revealed no definite cardiac enlargement but did show a rounding of the left ventricular border, suggestive of left ventricular enlargement.

† Operated on recently, and following operation has been doing well.

‡ Three of these cases were civil service applicants.

DISCUSSION

The purpose of this paper is not to discuss the arguments for or against 35 mm size fluorograms. Any one of the several smaller sizes of film meets the criteria for mass procedures of this sort—practicability, economy, and general suitability, with slight advantages for each. They have already proved their value in mass radiography.¹⁵⁻¹⁹ Further experimentation will undoubtedly continue to improve present methods until some of the remaining technical difficulties are solved. Perhaps a larger standard-sized film than used in this survey will come into general use, but increased resolution of film, fluorescent screens of greater brilliance, decreased aberration of lenses, and improvement of the viewers, are the prime needs at the moment to increase the standard of quality to approach conventional technique.^{13, 20-22}

It was stated in reports by Hirsch that fluorography sufficiently delineated the position and shape of the heart and that with suitable correction factors the diameter of heart shadows could be determined according to the methods used in teleo-roentgenography.²³ Although the value of mensuration is realized, true measurements can be obtained only when the projection error of the rays is minimal. Usually the films are taken at a 6 ft. distance and some distortion occurs, with the heart appearing proportionally larger, though only slightly; the contour is not altered. Actually the appearance in fluorograms has its advantages in suggesting enlargement earlier. Nevertheless, when one has become accustomed to interpreting fluorograms he can quickly gain an *impression* from the cardiac size and contour whether any radiographic evidence of heart disease will be present. The most difficult evaluation is to differentiate true cardiac enlargement in a hypertensive from a heart transversely placed in a hypersthenic and obese individual; similar puzzling views are not uncommon on

14"x17" film, despite attempts to eliminate the difficulty with thick-set persons by views taken in full inspiration and adequately exposed. Another difficulty which may lead to a misinterpretation is the prominent pulmonary conus frequently found in hyposthenic habitus. It must be stressed that the identification of heart disease from a chest film, regardless of size, is difficult; and a specific diagnosis without clinical investigation is to be condemned.

The number of cases of heart disease in this survey was larger than the incidence of pulmonary tuberculosis. This suggests that surveys of the general population, on older group, would reveal a further increase in the incidence and proportion of cardiovascular disease.

CONCLUSIONS AND SUMMARY

1. It is possible to detect cardiac abnormalities on routine fluorograms. Accurate diagnosis requires confirmation by further clinical investigation.

2. It is suggested by this series that the number of persons with demonstrable cardiac abnormalities on routine fluorograms is greater than the number of persons with tuberculosis in a given population.

3. Invaluable gains can be made when unsuspected heart disease as well as other thoracic diseases are diagnosed.

4. In any fluorographic survey cardiac disease should be looked for.

This report has been presented with the hope that roentgenologists interpreting miniature fluorograms will make an attempt to detect cardiac abnormalities routinely as well as those of a tuberculous nature. Accurate diagnoses must be made by clinical studies. The discovery of heart disease by mass fluorography is important, socially as well as economically, and it is submitted that this importance is comparable socially and economically to that of fluorographic tuberculous case finding.

The above report is not to be con-

strued as official or reflecting the views of the Naval Medical Department.

Even with the Law on Our Side

R. P. FOWLER

Bacteriologist, Loraine District Department of Health, Oberlin, Ohio

FOR many years public health workers have been writing articles for scientific journals. Some have recounted the incidents connected with outbreaks of epidemics which could have been prevented with the help of the "law." In this article we shall relate a series of incidents which ought to have caused an epidemic and only through the Grace of God did not—even though the "law" was on our side.

It is probable that no human food has had the benefit of so many millions of dollars of advertising as milk. If the eating propensities of Americans ever transmute us into a food-worshipping people, there is little doubt that the colossal image which will symbolize our God, or Goddess, will be a cow or a milk bottle. It is possible that all of this salesmanship accounts for the childish trust placed in the sanitary quality of any white liquid in a milk bottle of common or peculiar shape, though public health officials have fought long and sometimes bitter battles to guard the public from its misplaced faith.

Small wonder then that the saga of Typhoid Mary is one of the classics of United States folklore. It has been repeated, with variations, in many, many small communities, and some large ones. There is just cause for the harsh laws which have been passed to keep potential polluters of our abundant stream of life at a safe distance from the source of supply.

Our own health district took a sip—even more than a sip—of milk containing typhoid organisms, in 1926. In the

summer and fall of that year, 154 cases of milk-borne typhoid occurred in Wellington, a village of about 2,500. The source was found to be a typhoid carrier who worked on a farm which supplied milk to a local dairy. During the preceding summer he had worked in a dairy in a neighboring county. An outbreak of 60 cases of typhoid fever among the patrons of that dairy was the accompaniment of his employment there, but he was not apprehended during the investigation. The next year he made his way to a farm supplying the Wellington Dairy. Ohio law forbids a typhoid carrier to engage in the food or dairy business. This carrier, when apprehended, was, therefore, legally separated from his calling—that of a herdsman. Fortunately, the State Department of Health found him a job, about its offices, where he worked until his death some years later. That was an easy victory for the law, but in the saga we are now to recount, the law trod a rougher path.

Our story begins late in August, 1931, when the Lorain County Health Department was notified by a physician that a young woman patient had typhoid fever. The patient was the daughter of a dairy farmer living in the county. The girl's father, a man of about 50, had had typhoid fever in 1895. The typhoid bacillus was isolated in a stool specimen secured from this man while conducting the routine epidemiology on his daughter. Here was a typhoid carrier.

Good sense and accepted sanitary procedure demanded that the carrier (whom we shall call W.) should at once be

prohibited from handling milk. Such orders were immediately issued by the Health Commissioner and were approved by officials of the State Board of Health. Everyone understood that it would not be easy for W. to comply with the order, but the dangers involved in any other arrangement were so great that he would have to. Besides, it was the LAW.

In May of the following year (1932) a representative of the Health Department found W. handling milk. He was arrested and charged with operating without a license and selling raw milk at retail without bottling. The case was nolledd upon W.'s agreement to sign a statement saying he would personally quit milking and handling milk.

On March 17, 1934, W. was found milking a cow. He said he intended to continue. The law was resorted to again, and after numerous delays and postponement of the trial, a jury found W. "not guilty" because it was not convinced "beyond a reasonable doubt" that he was a typhoid carrier. The doubt grew out of the fact that W. had not been seen to void the stool in which the original finding of the typhoid bacillus was made. In fact, he said he had taken it from the privy which was at the far end of his barn.

The problem of establishing W.'s carrier status was turned over to the State Board of Health at this point. This body wrote several letters but never secured W.'s cooperation. On November 10, 1934, the case was returned to the local board of health.

The local board next undertook the drafting and passage of new milk regulations, since it was the opinion of counsel that those in force did not supply adequate coverage of the case. These regulations were passed July 13, 1935, and forbade a typhoid carrier to live on a dairy farm without the written permission of the Health Commissioner.

W. was, of course, refused permission

to reside on his farm while milk was being sold. Although he had been notified the preceding March that new regulations were being drawn and that such a clause would be included, he continued his residence there. During this period the following sign was found posted in the milk dispensing room, where all customers could see—"This Milk Not for Human Consumption." The Milk Ordinance was then amended June 12, 1936, so as to deal with this new move. Two places in this ordinance containing the phrase "for human consumption," 4 "for consumption," and 8 "to consumer," were removed from the ordinance. This legal refurbishing never had to be put to the test, as subsequent events took the case in other directions.

On July 20, 1936, a purchase of milk was made at the W. Dairy, and legal action again started. After one postponement of the case by the court, the prosecution was informed by counsel that a demurrer to the affidavit had been filed and granted and that "the case cannot be heard until the demurrer is decided upon." This was on September 4, 1936. During the ensuing 6 months a number of attempts were made by the Health Commissioner to make contact with counsel, to learn what was holding up the action. All attempts being unsuccessful, the Board authorized the Commissioner to see whether the County Prosecutor would handle the case.

The County Prosecutor visited W. promptly, and after some correspondence with W. and his attorney advised the Health Commissioner that the gentleman in question was ready now to comply with all regulations, and that he was "having a typhoid test by his personal physician."

There being no word subsequently from W. or his counsel, the County Prosecutor took the case before a Common Pleas Judge, who ordered W. to comply or go out of business by August 1, 1937. Later in August, 1937,

the State Director of Health advised that a stool specimen from W. had been found negative by an unaccredited private laboratory. The State Director's suggestion that further specimens be sent to the State Board of Health Laboratory was passed on to W. and his physician. This advice was followed and a positive finding was made by the State Laboratory.

One would think that this confirmation of W. as a carrier would have cleared the legal air, but such did not prove to be the case. W. continued to press the Board of Health for a permit, and finally on August 11, 1937, one was approved with the stipulation that a letter accompany the permit setting forth the requirements which W. must meet. This step was scarcely taken when on August 14 the County Prosecutor notified the Board that the Common Pleas Court had enjoined W. from handling milk and milk utensils.

These developments were followed by a communication from the State Director of Health to W., stating that W. was a proven carrier and that he, as Director, forbade him to engage in any occupation connected with food or milk supplies.

On August 23, 1937, W. was arraigned in Common Pleas Court, on the complaint of the Health Commissioner that the court order of about June 1, 1937, "to comply with the regulations of the Health Department by August 1, 1937" had not been fulfilled. (It was noted at this time that there had never been a hearing on W.'s arrest in July, 1936. The Health Department had been represented in that case by the police prosecutor of the city near W.'s residence.) After the usual delays, the Health Commissioner was able to report to his Board on October 19, 1937, that the Common Pleas Court had found W. "guilty of being a typhoid carrier" and had ordered him to have no personal contact with the milk business; but to see that the quality of the milk con-

formed to the standards of the Lorain County Health Department. W. was also ordered not to use the privy or any part of the dairy barn for disposal of his excreta, until he could produce evidence that he was no longer a typhoid carrier.

It is of interest that during the following month, November, an attorney from the city near W.'s dairy sought information about W. The son of a client of his was ill with typhoid fever. The family used milk secured from the W. Dairy. A suit to obtain damages from W. was contemplated. The record does not show whether or not this suit was filed.

W.'s permit to sell milk was not renewed January 1, 1938. It seems probable that this position was taken because of extensive Bang's disease infection in the herd. A program of 60 days' retesting was set up and the minutes of the Board of Health contain several references to improved coöperation on W.'s part. On June 14, 1938, he was given a permit. This does not mean that no milk was sold by the W. Dairy, from January 1, to June 14, but that the degree of noncompliance argued against issuance of a permit. On the other hand, apparently improved relations did not suggest prosecution for operation without the permit.

On the 30th of the same month (June, 1938) a report of a case of typhoid fever was received from the Health Commissioner of the city near W.'s dairy. The report suggested that the epidemiology of the case pointed to the W. dairy as the source of infection.

Repeated tests of the animals in the W. dairy herd and removal of reactors did not materially reduce the Bang's disease. In July, 1938, W. was asked to pasteurize his milk. He agreed to do this and the plant was put in operation about December 1, 1938.

In October, 1941, the Health Commissioner of W.'s neighboring city reported

another case of typhoid fever, writing, "only source of infection that can be determined is W. dairy." He said that he understood that W. was handing out bottled milk to customers, in violation of the court order issued several years previously. This could not be proved.

However, on March 16, 1942, W. was found in his barn milking cows. He said he had been doing it for some time because of the shortage of help, and asked what would be done about it. A motion for citation in contempt of court was filed in the Common Pleas Court, in April, 1942. On June 29, 1942, W. was found guilty and fined \$300 and sentenced to 10 days in jail on each of four specifications. The judge, however, ordered that the fine should be paid on one judgment only, and that the jail sentences should be served concurrently.

This should have settled once and for all the trying relations between W. and the Health Department, and given the public the protection it needed, but no such happy solution resulted.

The question of a renewal of the license—or the granting of a license—to the W. Farm Dairy, Inc. was immediately raised. By this time the demand that W. separate himself from the dairy business had been met by the formation of "The W. Farm Dairy, Inc.," with Mrs. W. as President of the concern. Mr. W.'s attorney sent word that "W. is no longer residing in the home." Counsel for the Health Department at this stage of the game was the Assistant County Prosecutor, since the Prosecutor had represented W. in his successful jury trial in 1934. The Assistant Prosecutor advised the Board that a permit should be issued to The W. Farm Dairy, Inc. "provided W. no longer works or resides on the farm." The permit was issued September 15, 1942. Note was made of the fact that a man and his wife had been employed to operate the dairy. This couple stayed approximately two months.

W. then requested permission to work on the farm until crops were harvested. This was discussed for some time and the request was finally granted. But on November 21, W. was still seen on the farm and objection was made to this. Nevertheless, a permit for 1943 was issued on advice of counsel, again with the stipulation that W. was not to work or reside on the farm. W.'s counsel countered with the statement that the corporation was complying with all laws, and that no further action was necessary "until the declaratory judgment case is heard." This declaratory judgment case was an action, carried to the Supreme Court of Ohio, testing the Common Pleas Judge's correctness in refusing to consider a motion for a new trial, because it was filed too late following the trial on June 23, 1942.

The Supreme Court of Ohio announced on February 10, 1943, that it would not consider the petition of W.'s counsel in the above declaratory judgment. W. was taken to the county jail to start serving his 10 day sentence. He was released after $2\frac{1}{3}$ days, on a habeas corpus action, granted by the Court of Appeals.

W. was then cited immediately by the Assistant Prosecutor on a new contempt of court charge based on evidence secured by deputy sheriffs when they went to his home to take him to jail. They found him in the barn.

He was again found in the barn by a Health Department inspector, before the hearing on the second contempt case. During this interval a public sale was held on the W. farm. Some of the cattle and part of the equipment were sold.

On March 23, 1943, the Common Pleas Court Judge found W. guilty in the second contempt case and pronounced a sentence of 10 days in jail, and a \$500 fine. Motion for a new trial was filed immediately by the defense. W. was taken to jail but was released

after 2 days on bond fixed by the Court of Appeals.

The habeas corpus writ on which W. had been released from jail following his conviction in the first contempt case was passed upon by the Court of Appeals on June 28, 1943. The Appeals Court sustained the judgment of the Common Pleas Court. On June 29, 1943, he was held in contempt and was taken to jail, but was released the following day. The following Journal entry was made by the Clerk of Courts June 30, 1943: "The defendant herein, having this day paid to the Clerk of Courts the sum of One Hundred fifty-three and 47/100's Dollars (\$153.47), and all unpaid costs to date, the Court, on its own motion, does suspend the second fine of \$500.00 and ten (10) days in jail and also the unserved days in jail under the first conviction, said suspension to continue so long as the defendant complies with the injunction here." So ends the official record of twelve years of legal sparring, for the "W. Farm Dairy" surrendered its permit and no evidence of milk sales has been observed since.

Examination of the records of the Clerk of Courts and inquiry of the county sheriff show that in all W. paid one \$300 fine, \$119.11 in court costs and served $5\frac{1}{3}$ days in jail. This seems modest treatment in view of the fact that there were six arrests and that the charges involved a matter of extreme importance to the public.

If profit is to come from this article, we believe it will come because we have

highlighted the fact that "having the law on your side" and "knowing that you are right" does not always protect the public. The average farmer, bent with work and marked by the elements, is a defendant whose appearance and vocation weigh heavily in his favor. This point, perhaps, cannot be fully appreciated by those who deal only with city dwellers. Also, the necessity for keeping our story in hand has prevented a recital of the multitude of legal devices such as demurrers, postponements, appeals, habeas corpuses, etc., which prolong the danger period. Implicit evidence of this is the fact that although constant effort was exerted for twelve years to keep W. away from milk, he was repeatedly found in contact with it. At one time the Health Department had cases pending against this defendant in the Common Pleas Court, the Court of Appeals and the Ohio State Supreme Court. It may be helpful to point out that no case was won in courts below the Common Pleas Court, and none was lost in the Common Pleas or higher courts.

Finally, it might be pointed out for the benefit of those workers in public health who have not realized it before, that one of the foundation stones of legal philosophy in this country is that it is better for many guilty persons to go unapprehended than to have one innocent person convicted.

Awareness of this principle is imperative as regulations are being drafted, evidence collected, policy formed, and affidavits drawn.

NURSING AND NURSING EDUCATION

THERE have been two major signposts on the road to a clearer comprehension of the rôle of the nurse in modern society and of her preparation for her calling—Josephine Goldmark's classic report for the Committee for the Study of Nursing Education in 1923, and the monograph, "Nurses, Patients and Pocketbooks," prepared by May Ayers Burgess for the Committee on the Grading of Nursing Schools, issued in 1928. Esther Lucile Brown has given us a third document of almost equal importance in a recent report, "Nursing for the Future," prepared for the National Nursing Council and published by the Russell Sage Foundation.

Perhaps the most outstanding feature of this document is its recognition of the complexity of the problems involved. Dr. Brown analyzes the actual functions fulfilled in the provision of nursing care and makes it clear that there are at least two quite different types of workers needed in "nursing"; and that—for the present at least—a third, middle category must be recognized between the other two. So long as attention is focused solely on the graduate nurse, "no other avenue is open except that of the present frantic and probably futile effort to recruit more prospective R.N.'s. Even appreciably better educational preparation is likely to be denied them, so insistent will the demand for nursing service continue to be. Once emphasis is shifted to *nursing*" (rather than to nurses), "however, several roads seem to point to potentially larger supplies of service and to possibly increased efficiency both on the nonprofessional and the professional levels."

In connection with a group of simpler functions, there is clearly a need for what Dr. Brown describes as "non-graduate" nursing service, such as is rendered by the "practical nurse," or attendant, the orderly and the ward maid. As to the preparation of the practical nurse, the 1947 study of the U. S. Office of Education is cited with general approval; and Dr. Brown notes the opportunities offered by vocational or adult education units of the public school system. She points out, however, that "No system of training for practical nurses is likely to succeed unless the public that creates broad general policy and provides funds, educators who design and operate instructional programs, hospitals and agencies that provide

clinical facilities, and nursing associations and state boards of control that set standards and influence recruiting are prepared to manifest an *active* interest in practical nursing far beyond any interest yet shown."

At the other end of the scale, Dr. Brown discusses with admirable clarity the functional rôle of the "professional nurse." She analyzes in some detail the responsibilities of such a nurse as a skilled technician, as a minister of the healing art (with particular emphasis on psychotherapy), and as a specialist in supervision, administration, teaching, consultation, planning and promotion of professional activities and public health nursing (above its lowest levels). It would be desirable that Chapters IV and VI of "Nursing for the Future" be made required reading for the individuals and groups who are now advocating various nostrums for the cure of the nursing shortage, without knowledge of the actual status of nursing and nursing education which can alone make their pronouncements of significance. Dr. Brown recommends that the term "professional" when applied to nursing education "be restricted to schools (whether operated by universities or colleges, hospitals affiliated with institutions of higher learning, medical colleges or independently) that are able to furnish professional education as that term has come to be understood by educators." When operating in institutions of higher learning, such schools should be "autonomous units vested with the same status as the other professional schools." She urges that "individual persons, informed groups, and private corporate bodies including foundations and institutions of higher learning themselves, make the largest possible sums available for the creation and strengthening of soundly conceived college and university schools of nursing" and "further, that official bodies—local, state, and federal—concern themselves at once with supplying whatever additional resources are necessary for the adequate support of nursing education on the professional, as well as the non-professional level."

Between these two extremes—of the non-graduate nursing aid, on the one hand, and the truly professional nurse, on the other—stand the graduates of most of the hospital training schools of this country. Whether a middle group of nurses of this type will ultimately be desirable, Dr. Brown holds that we cannot conclude at the present time. It may be that the dynamic forces at work in this field will increase the number of "professional" nurses and raise the quality of "non-graduate" personnel so as to close the gap. At present, however, the vast majority of persons with any training in nursing, come from the middle group. A substantial proportion of the present schools should certainly be closed as "socially undesirable" or turned into training centers for non-graduate personnel. In a rating by the U. S. Public Health Service, of 1,125 schools of nursing participating in the programs of the Cadet Nurse Corps, 30 per cent were rated as "poor" or "very poor." The "fair" and "good" schools should be improved—in various specific directions, outlined in the report, with "experiments in simultaneously shortening the period of training but improving the course of study." The best of the hospital schools should be encouraged to attain professional status by affiliation with adjacent educational institutions. Dr. Brown strongly recommends that "nursing make one of its first matters of important business the long overdue official examination of every school"; and the widespread circulation of a comprehensive list of accredited schools, with the unquivocal statement that this list includes all schools except those which had failed to meet minimum requirements or had refused to permit examination.

This report has been prepared with expert judgment, temperateness and vision. It presents principles which are essentially sound, and opens the door to fruitful

experimentation and planned progress. It is not a detailed blue print but a challenge.

The bright hopes with which we all hailed the Goldmark Report and the creation of full-fledged University Schools of Nursing at Yale and Western Reserve, a quarter-of-a-century ago, have not been realized. That example has not been followed by the general advances elsewhere which we anticipated. In preparation of personnel for nursing the sick, we have developed neither an adequate training for the non-graduate nursing aid, nor a sufficient number of high grade schools for the education of the professional nurse. Hospital training schools for the most part remain primarily convenient devices for securing unpaid hospital service. They cannot become, in any true sense, educational institutions, until they are provided with adequate funds for educational purposes.

Today, the shortage of nursing personnel makes the solution of this problem more immediately urgent than ever before. It is a problem which can be solved only by the vigorous and ample support of both private philanthropy and official governmental agencies. The solution must, however, be worked out by the nursing profession and sold by the nursing profession to the public. There is no body more open-minded and earnest in its response to new ideas than the nursing group. This group is reading the report and thinking about the report, and discussing the report. Something more than thoughtfulness is, however, demanded of the nursing profession today. It is a time for action.

WE PAY THE PIED PIPER

REMEMBER the story of the city of Hamelin? As a child I recall the feeling of loathsomeness that crept over me as I read of the trials of that little city in its efforts to rid itself of the uninvited and unwanted four-legged guests. There was the feeling of jubilation when the Pied Piper, that good fellow, walked down the street with all of the rats of the city intoxicated by the music of his pipe following him to their death. But the story ends with a tragedy; all of the children of the city are led away by the Piper because his bill for killing the rats was not honored.

Today we are paying the price of the Piper in practically every city of the nation, and in many parts of the world the Piper's penalty is being exacted—and we are not ridding ourselves of the rats!

Hans Zinsser in his delightful volume, *Rats, Lice and History*, quite appropriately dwells on the history of the rat and on its importance. He says, "It carries diseases of man and animals—plague, typhus, *Trichinella spiralis*, rat-bite fever, infectious jaundice, possibly trench fever, probably foot-and-mouth disease and a form of equine 'influenza.' Its destructiveness is almost unlimited." To this imposing array of health hazards can be added *Salmonella* infections through contamination of food by the discharges of rats.¹

The economic price paid for condoning the rat population in our midst has been estimated by numerous investigators. Silver (*op. cit.*) has estimated the rat population to be 60,000,000 on farms; 34,000,000 in non-farm country residences and in towns of less than 10,000 population; and 29,000,000 in cities of more than 10,000 population. This gives a total of 123,000,000 for the country as a whole. Various estimates place the cost of each rat at 2 to 4 dollars per year. Even in

these days of generous spending the loss is considerable. This is part of the Pied Piper's price we pay.

Food is a political force in the world now, perhaps as never before. We have been told that at least 400,000,000 bushels of grain must be made available to Europe to prevent starvation and the unrest that will otherwise be unavoidable. Recent estimates of the U. S. Department of the Interior put the loss of grain due to rats at 200,000,000 bushels per year. This loss is made up in part by the amount eaten, plus an even larger quantity rendered unfit for human consumption by rat contamination or damage. These 200,000,000 bushels can save many lives. Until we stop this avoidable loss we continue to pay the penalty imposed by the Piper.

Public health workers of all categories are now presented with an unequalled opportunity to reduce the danger to health presented by the presence of hordes of rats. They can contribute to the economic welfare and political stability of the world at the same time. The National Urban Rat Control Campaign sponsored by the National Committee for Rat Control, and the Fish and Wildlife Service, U. S. Department of the Interior, has riveted the attention of civic officials on the rat problem. Even though the amount of money made available for the use of this committee was woefully small, it has already stirred up nation-wide interest, has obtained numerous newspaper and magazine articles on the subject, and has appealed directly to the governing bodies of every city of 10,000 population or more for intensive action to eliminate the rat. By the end of June 570 cities had given serious consideration to active rat-eradication campaigns. To this, should be added the list of industries, granges, restaurant, dairy and similar groups that have taken up cudgels against this foe. The health department is the logical body to undertake a continuing program if present enthusiasm is to be used to the fullest extent.

There is no reason why rats cannot be kept in control in any area if public interest demands it—and makes funds available. The fronts upon which the rat population can be attacked remain fourfold: killing the rat itself by trapping, poisoning or gassing; depriving the rat of food supplies; elimination of breeding places; and ratproofing buildings to prevent access. For satisfactory control, all of the four methods of attack must be utilized. Furthermore, the program must not be a sporadic one but must be continuing, for best results. That is why the health department, because of its interest in rat eradication as a disease prevention procedure, seems particularly qualified to take leadership in the programs. The public must be convinced of the desirability of rodent control measures, and funds must be made available to permit the employment of properly qualified staff, and development of effective measures.

Recent activities serve to demonstrate ways by which resources can be brought to bear on rodent control programs. A recent paper in the *A.J.P.H.* relates experiences in Baltimore to show that citizen interest and participation can be obtained with satisfactory results.² The City of St. Louis has seen the advantages of a section of the Health Department, organized for the specific purpose of carrying on a rat control program.

The development of at least two new rodenticides makes the mass killing of rats easier. Antu (alphanaphthylthiourea) has been found particularly effective against the brown rat. Another new resource is Compound 1080 or just plain 1080 (sodium fluoroacetate). Although highly toxic to men and so necessitating close supervision by a thoroughly qualified person, use of this chemical has

produced phenomenal kills. The old stand-by, red squill, is back to pre-war potency, and other favorites are again available.

Numerous good bulletins have been prepared outlining methods for the most effective ways of achieving success on the four-front attack. The U. S. Public Health Service has done outstanding work in preparing usable pamphlets. Several of the state health departments have made commendable contributions in this field. Commercial pest control organizations are meeting their obligations by intensive publicity to their members telling them of new and approved methods.

Here is a "made" situation for every health department. There has not been any other opportunity as great as this for the creation and stimulation of effective rodent control programs. All members of the public health team, the administrator, engineer and sanitarian, the nurse, and the epidemiologist, are keenly concerned with the successful operation of these programs.

THE COMMUNICABLE DISEASE CENTER AT ATLANTA

THE Communicable Disease Center of the U. S. Public Health Service was established in Atlanta, on July 1, 1946, but its purposes and possibilities deserve wider understanding than they have yet received.

The principal responsibility of this Center is to assist state and local health agencies in the control and prevention of communicable disease by providing, when requested, facilities not ordinarily available to their health departments. These facilities take the form of personnel, equipment, supplies, and professional services; the Center makes no monetary grants-in-aid.

To assist in the diagnosis of communicable diseases, the CDC accepts from state and local health laboratories limited numbers of reference specimens presenting diagnostic problems beyond the resources of these laboratories. To the technicians employed in these laboratories, it offers refresher courses in various fields of laboratory diagnosis. To maintain high standards of technician interest and performance, test specimens and materials are sent each month to a large number of health laboratories. Evaluation studies are conducted on the sensitivity and specificity of many laboratory procedures.

The CDC assists in the control and prevention of communicable diseases by transmuting appropriate scientific facts about communicable disease into experimental control practices, field-testing them on progressively larger scales and under diverse conditions, until their effectiveness and practicality are proved. It promotes the use of proven procedures by demonstration and by training health personnel in their utilization. Operational control programs, involving the efforts of several states, are coordinated by the Center and are expedited by its technologic assistance in the design, fabrication, and field evaluation of equipment for the dispersal of sprays, dust, and aerosols, and of chemicals used in the control of arthropods, helminths, and rodents of public health importance.

The Center provides investigative and consultative services for the states and communities where communicable disease outbreaks occur or where continued threat of such outbreaks may exist. At the request of state health authorities, epidemiologists and mobile laboratories are dispatched to the scene of epidemics

to determine their cause, sources, and extent. Where possible, control procedures are recommended and, in emergencies, are actually initiated, pending the mobilization of local and other resources. Veterinary public health assistance is offered in epidemics involving both man and the lower animals; consultative services are available, upon request, to state and local health agencies in formulating effective immunization regulations to prevent such outbreaks.

The Communicable Disease Center is the designated agency of the U. S. Public Health Service to render assistance to communities in major disasters. It works closely with the American Red Cross but directs its efforts specifically at the prevention of post-disaster epidemics and in the rehabilitation of local sanitary facilities.

Facilities are available at the Communicable Disease Center and in its training areas for the field training of public health personnel in the diagnosis, control, and prevention of communicable diseases. Publications and audio-visual aids of a technical nature are produced at the Center to implement the training program, and for use by state and local health departments and by certain professional schools. No materials are developed for lay or community health education. As a result of demonstrating and promoting improved techniques in the practical methods of control in communicable diseases, and by the training of health personnel in the field application of these methods, it is anticipated that state and local health departments will extend their interest and effectiveness in programs of communicable disease control.

LETTERS TO THE EDITOR

TO THE EDITOR:

I wish to thank you for your generous praise of the United States Public Health Service in the editorial which appeared in the July *A.J.P.H.* In it you have caught the spirit of increasing concern of both the people and the Congress for the nation's health as evidenced by an expanding Public Health Service program. Frequently, in our staff meetings, we have long discussions of some change proposed by the Federal Security Administrator or ourselves, in either management services or programs, and invariably some of us cling to the past and object to change only to find that the health picture and the programs of the Public Health Service are dynamic, and that with their constant change must come inevitable changes in our approach to the problems.

I appreciate your confidence in the Service and your kind words regarding

its administration of the trust bestowed in it by Congress and the people. I believe that health is now a major issue in the minds of all people and will continue to be that throughout time. I believe we are only scratching the surface at the moment and that the coming years will see far more official and voluntary action in the health field than we have had in the past, paralleled by general improvement in the health of the nation. One thing which we have jealously guarded in the past must be guarded in the future; the Public Health Service must remain a technical agency with broad authority, and must not in any sense be placed in a position where it can be guided by party or politics not in the best interest of health.

I believe that the next steps in public health should include provision of more adequate financial support to professional schools to enable them to secure

their present, and in some cases insecure, status, and to enable them to increase the number of persons being trained. This will help to overcome professional personnel shortages, improve training and increase the opportunities of the people for more adequate medical care.

I am hopeful that there will be a positive and successful drive in the next eighteen months to extend local health services throughout the nation, and that it will be possible within the next year to provide increased support for extension of these services by grants to states, at least up to the limit of the ceiling set by the 78th Congress in 1944. I am confident that the needs of the states for assistance will be more swiftly met by early passage of categorical legisla-

tion stressing the importance of local health units as the foundations for healthy, happy communities.

During my administration the Public Health Service will continue to utilize the best advice available from individuals and organizations outside government in the further development of its programs. If we develop our plans with their help, we can keep "State medicine" the good health service to the public which your editorial described—and history has shown our program to be.

LEONARD A. SCHEELE

Surgeon General

U. S. Public Health Service

August 23, 1948

TO THE EDITOR:

In his view of Carl Malmberg's *140 Million Patients** which you published last spring, Dr. George Baehr presents a criticism of nation-wide compulsory health insurance which deserves serious attention.

Dr. Baehr does not oppose compulsory health insurance in principle, and he recognizes essential inadequacies in voluntary insurance; but he fears that a national health insurance law would saddle us with more demands and obligations than we can meet and that we must *first* get more and better distributed doctors, hospitals, and local health departments; must extend group medical practice, voluntary health insurance plans and regional hospital organization; and must "educate the public and the medical profession concerning medicine in the changing order." The standards of the profession can thus be maintained and the quality of service improved.

I am in full agreement with Dr.

Baehr's objectives but I do not believe they can be attained unless we *first* have comprehensive public action on the economic problems of medical care.

Without national health insurance, organized medicine and its allies will be able to channel the inevitable growth of voluntary health insurance plans into forms quantitatively insufficient and in most cases qualitatively undesirable, compelling these plans in all but a few exceptional instances to fall within the pattern of individual practice, limited scope of service, unsupervised quality of care. Tax-supported medicine will also increase for special categories of persons and of disease. It will be available as a rule only to those who can pass a means test and will mostly be either direct state medicine or individual "panel practice."

I had hoped for an evolutionary development of group practice along with prepayment when I signed the *Report of the Committee on the Costs of Medical Care* in 1932, recommending essentially what Dr. Baehr now proposes. But observation of the course of events

* *A.J.P.H.*, 38, 4:573, (Apr.), 1948.

and analysis of the forces at work on all sides of these issues, have convinced me that this outlook is academic. By 1942 the door seemed to me definitely closed to the possibility that leadership from physicians like Dr. Baehr would be accepted by official organized medicine and followed by the body of the profession. Soon thereafter I expressed myself publicly, for the first time, in behalf of the prompt enactment of national health insurance, and have since done what I could to support and improve the legislation proposed to establish it.

The major professional problems of organization, distribution, and quality of medical services cannot be solved without more assured and more stable paying power on the part of patients, nor without some increase in paying power among self-supporting families of the middle and lower income groups and in the poorer areas. Nor can they be solved, I readily admit, by these economic measures alone. But the establishment of national health insurance would do more than merely provide the needed improvements in paying power. It would also create active demand among many laymen for improved forms of medical service, because it would assure the wherewithal to achieve these ends and would make it worth while to utilize the advice and leadership of progressive physicians and administrators.

It would remove the financial barriers to preventive services and to early diagnosis of disease. It would increase and stabilize rural paying power for physicians and hospitals, and would at long last reverse one of the major causes of rural medical impoverishment. It would

assure the continued independence of voluntary hospitals, and provide payment of cost-of-service for care rendered insured persons and their dependents.

Potential group practice plans and their doctors could be assured of income from the health insurance funds. A properly designed health insurance law would permit the majority of physicians to select the method of practice and payment which they prefer, and would also protect minority groups in the same freedom of choice. In sum, national health insurance would create new incentives for both laymen and physicians to achieve professional and economic goals conjointly.

The fear that national health insurance would be premature and disruptive arises partly from misunderstanding. Dr. Baehr shares this misconception when he says that the proposed law "would promise all workers complete and adequate medical care wherever they may live." No sensible advocate of national health insurance and no proposed legislation makes any such promise. I bespeak study of the actual proposals and of the timing of the steps toward their realization. It is time now for progressive physicians, public health and hospital administrators who work to improve the standards of medicine, to sit down with leaders in the lay groups who, as at the National Health Assembly, demand prompt, nation-wide application of the health insurance principle. By such coöperation, results desired by all can be achieved.

MICHAEL M. DAVIS

October 7, 1948.

Clearing House on Public Health Salary Information

WHY NOT JOIN THAT NEIGHBOR

The latest list of local health officers in Mississippi has just been received. It furnishes a classic text for a sermon that cannot be too often preached in the attempt to solve the problem of current personnel shortages which is due in part to salary levels that put health workers at a disadvantage with other professional workers of comparable training in a community.

Mississippi, with the lowest per capita income among the 48 states, has 82 counties, 9 of which had 1940 populations of approximately 50,000 or more and only 1 of which had more than 100,000 persons.

The list of health officers indicates that 52 counties, including the most populous 9, are organized to have single county health departments; 6 are organized in three bi-county units, 3 in a tri-county, and 4 in a four-county unit. Two of the single county departments, each serving populations of less than 20,000, are currently without the services of a health officer, as is the three-county unit with a population of nearly 50,000. Four counties are served by acting directors who have other responsibilities in the State Health Department or elsewhere. Significantly, 11 counties and a bi-county unit are served by acting directors who are the health officers of neighboring counties, and in two instances health officers are shared by two counties or by a county and a bi-county unit without their being reported as multi-county units. Of these 14 temporary combinations none serves a population of 100,000 and 6 serve fewer than 50,000 persons.

The inevitable question that comes to mind is "Why are the partners of these temporary companionate marriages not led to the altar and blessed with the marriage lines?" Does a county with 19,000 population hope to attract or pay for a trained health officer and other professional personnel in the present market, or for a long time to come? Is not this the time to snatch victory out of adversity?

It should be added further that Mississippi has 8 counties with part-time health officers, presumably giving their major attention to private practice, and 7 unorganized counties.

If the findings of the Subcommittee on Local Health Units have any validity, the entire population of Mississippi could be served by from 30 to 40 local health departments. The state has 35 medical health officers currently on the job locally. Why should they not serve the entire state and their salaries be increased proportionately so that they would not be raided by states paying higher salaries? It cannot be too often repeated that suitable administrative organization is a part of the salary and personnel problem.

It should be added that a similar situation could be found in the list of health officers of any of a dozen other states. Mississippi is merely more up-to-date in furnishing a current list of health officers.

WHAT YOUR 1948 SALARY BUYS

Material that might be used with good effect in persuading appropriating bodies of the need for increasing public health salaries is an article in the August

13, 1948, *U. S. News and World Report* (24th and N Streets N.W. Washington 7, D. C.). Entitled "Where Buying Power Goes Up," this indicates that price rises have offset the 1948 tax cuts for the majority of persons, leaving them worse off in 1948 than they were in 1947. All persons with 1948 incomes of less than \$12,500 have less buying power in 1948 than in 1947. A married man with two dependents who had a net income of \$7,500 in 1939 needed to have \$15,809 in 1947 to have the same buying power as in 1939, but in 1948 he needed only \$15,168 or nearly \$600 less. But the man with an income of \$5,000 needed \$9,769 in 1947 and \$9,819 in 1948 to maintain his purchasing power. The \$2,500 man of 1939 needed \$4,511 in 1947 and \$4,664 in

1948 to maintain his standard of living.

"What all this means," the *U. S. News and World Report* points out, "is that people have had to change their ideas about salary ranges," and what that means to the appropriating body of County X is that if \$7,500 was a proper salary for its health officer in 1939, \$15,000 plus is its 1948 equivalent, and if he had reached the rarified atmosphere of a \$10,000 salary in 1939, he now needs \$20,650, if he is not to seek greener pastures in other states or other activities.

The report is accompanied by excellent pictograms in color that do not require the reader to be statistics minded in order to grasp the significance of the figures.

Credit Lines

A NEW TECHNIQUE FOR RECRUITING NURSES

The Ohio State Nurses' Association and the Cleveland Health Museum have coöperated in creating a special Nursing Education Exhibit entitled "What Nurses Do." It has a three-way goal: (1) to attract qualified young women to the nursing profession, (2) to tell the public about the nurse's educational backgrounds and the value of her services to the community, (3) to emphasize the varied duties in the six major nursing fields.

The exhibit had a preview showing in the Cleveland Museum of Health in October beginning with a special ceremony on October 2, at which Haven Emerson, M.D., made the keynote address. The exhibit is now being featured in special showings throughout the state.

A LIVING WAR MEMORIAL

The National War Memorial Health Foundation; A Living Memorial, The Plan for People's Centers; and Why People's Centers; are three pamphlets that tell how the idea for a living memorial to the 10,000 South Africans who gave their lives in the 2nd World War, was born among the South African troops themselves during the Italian campaign. The story goes that they read and reread the famous "Four Freedoms" on the lire notes they received as pay. They mused on the reasons why Cape colored troops of Africa showed a lower disease rate than European troops of Africa, though in Africa itself conditions were reversed. They suspected freedom from want was the answer and they planned a war memorial that would "bring to the needy of South Africa freedom from want and freedom from fear." And forthwith

they pledged 17,000 pounds out of their own army pay.

Out of this grew the health foundation which is concentrating its efforts on promotive health. People's centers are being set up to promote good health and living conditions for all sections of the country, with special regard to the needs of the non-European. Eight regional offices have been opened.

These pamphlets are available from the National War Memorial Health Foundation, P. O. Box 8446, Johannesburg, South Africa.

TEN YEAR DENTAL PROGRAM

A citizen's committee of Askov, Minnesota, which in 1940 was a hamlet of 312 people, initiated a request for a 10 year dental program which is now being furnished through the coöperation of the U. S. Children's Bureau, the Minnesota Department of Health, the Minnesota Dental Society, and the 6 practising dentists of Pine County.

The aim of the program is to find out how much dental improvement can be effected by using every known method of promoting dental hygiene. All Askov children from 3 to 17 years of age and other children attending the Askov high school, a total of about 350, will be included in the program.

There will be periodic application of fluorine to the teeth of children, brushing the teeth with a dibasic ammonia dentifrice, frequent dental checkups with prompt repair of all cavities, and continuous education in nutrition and general health measures.

The State Health Department's Dental Division Director, William A. Jordan, D.D.S., is supervising the program, and furnishes a dental health adviser. The actual dental work is being done

by the 6 dentists of the county, the community provides office space, a full-time clerk, and funds to pay dental fees of families who cannot pay their own. Preventive work is financed by the program, but corrective work is paid for by the families at a scale set by the participating dentists. The program began operation shortly after the opening of the school year in September.

TRAINING MANUAL, U.S.P.H.S.

Although orientation is already an overworked word, the concept that it represents—making it possible for a worker to see what he does in relation to the whole program of his organization and giving him perspective on its importance—is far too often forgotten. As an orientation and training manual for U. S. Public Health Service workers, the Communicable Disease Training Center at Atlanta, Ga., under the direction of R. A. Vonderlehr, M.D., has prepared "For the Nation's Health."

It has excellent historical material on the Service, and good short descriptions—with illustrations, humorous and photographic—of its activities. Though not intended for that purpose, it would also serve admirably to give workers in other fields and the public generally, perspective on this important federal agency.

The fly leaf says "Material in this manual is not for publication." But if it were wanted badly enough, the Communicable Disease Center, 605 Volunteer Building, Atlanta, Ga., might part with a copy.

WEST VIRGINIA'S MOVIES CATALOGUE

West Virginia has joined the list of state health departments that have prepared a list of films available on loan from the department's health education service.

The mimeographed list of some one hundred films is divided into 13 subjects; there is uniform name, facts, de-

scription, and suggested use information for each film as well as blank spaces for additional films on the subject.

The use of simple line drawings and colored paper on alternate pages and good workmanship generally make it a pleasing as well as a useful document. Also the list is prefaced with a discussion of the film as an aid in education but not as a substitute for the teacher. There are also suggestions on how to use films and exact instructions on film borrowing procedures. There is no indication whether it is available outside of the state but the address of the State Health Department is Charleston 5, W. Va.

TEXAS CANCER BULLETIN

Now in its fourth issue the *Texas Cancer Bulletin* is published bi-monthly by the Texas Cancer Coördinating Council, representing the State Medical Society, the State Health Department, the State Cancer Hospital, and the Texas Division of the American Cancer Society. On the theory that the family doctor is the one who sees cancer in its early stages, its purpose is to "convey to the physician in brief, meaty form, the results of important researches in the varied fields of cancer" with emphasis on the "time-tested and proven techniques" but not omitting "News."

It is also an excellent production job—attractive colors, good illustrations, print that is easy to read. Editor, Russell W. Cumley, Ph.D., M.D., Anderson Hospital for Cancer Research, Houston, Tex. \$4.00 per year.

MORE MINNESOTA HEALTH DAYS

In February, six southwestern Minnesota counties held a Health Day (*A.J.P.H.*, May, 1948, p. 718). This was followed by the formation of a number of local or county health councils. Six additional Health Days were held in September and October with

each group including from 5 to 14 counties and totaling 52 counties. Governor Youngdahl addressed each of the meetings which included group discussions of local health problems, health films, and keynote speeches. It is expected that local or county health councils will grow out of these district health days. The meetings were sponsored by the Woman's Auxiliary of the Minnesota Medical Association, and the State Health Department helped in organization and publicity. Twenty-four counties will be covered in future Health Days.

THE HOME TOWN REALITY OF A FEDERAL POLICY

Nearly two years ago the *Ladies Home Journal* started a Public Affairs Department under the editorship of Margaret Hickey, (*A.J.P.H.*, 37, 4:463). The October, 1948, issue has two related articles that are significant not only for the information they give but for their method of presentation. One article is "Next Steps in Medical Care," an analysis of the program of the U. S. Children's Bureau for the extension of maternal - and - child - welfare services through a doubling of Congressional appropriations between 1947 and 1948. The other article is "Mountain Mothers" which tells for the layman, or perhaps better the laywoman, the story of the Oneida Maternity Hospital serving the sparsely settled mountain region of Clay County, Kentucky, and financed in part by grants from the Children's Bureau. Miss Hickey makes real the hardships of the mountain women, the struggles the hospital management suffered from the time in 1941 when it opened with a staff of a nurse, a cook, and a doctor, to the present time when there is a staff of twenty-five and affiliation with the Louisville Medical School. This is an outstanding example of humanizing for the reader the general facts about coöperation between state and fed-

eral authorities and the principles of federal grants-in-aid to states for health and medical services needed and planned by local communities.

THE HABIT OF ANNUAL MEDICAL EXAMINATIONS

In his annual report, Edwin S. Burdell, director of Cooper Union (Cooper Square, N. Y. 3), says "If college students already haven't the habit of annual physical examinations, it is up to the schools to help them acquire the habit and to encourage those with ailments to do something about their defects in terms of appropriate private or public health organizations."

In accord with his belief that educational institutions must assume responsibility in the field of preventive medicine, Cooper Union's 2,000 undergraduates are required by its student health program to have physical examinations at least annually. Twenty per cent examined by the staff physician are found to have remediable ailments and are referred to appropriate specialists for correction. Sometimes also a reduction of subjects carried by the student is recommended until corrective measures have operated. In 1947-1948, 567 students were given supplementary examinations at their own request. In the same year, 1,753 students received chest x-rays of whom 2 per cent were referred to the Department of Health's Chest Clinic and three with active tuberculosis put under medical care.

ATTRACTING ATTENTION WITHOUT SHOUTING

Canada's Health and Welfare is less than three years old. But it would put many an older publication to shame. Its July, 1948, issue, which includes a Family Allowances Supplement, is a joy to behold with sprightly pictographs, simple writing, and subdued colors. The chart showing the allocation of the \$17,000,000 annual national health grants

for various purposes is an original way of presenting conventional pie chart material. Information Services Division, Department of National Health and Welfare, Ottawa, Canada.

KNOWING YOUR OWN DEPARTMENT

Among the innovations of Harry S. Mustard, M.D., Health Commissioner of New York City, is a manual for employees entitled "You and Your Department of Health." This 50 page document might well serve as a model for other health departments. It is neither mealy-mouthed nor saccharine but says what it means and means what it says. The mailed fist never appears but rather the velvet glove. It was prepared by the Personnel Bureau whose director is William Brody. It is amusingly and effectively illustrated by Tom Darling, of the New York Tuberculosis and Health Association, an interesting example of voluntary and official health agency coöperation.

A GOOD BREAKFAST CAMPAIGN

A recent sampling study of 1,200 West Virginia school children showed that only 10 per cent ate an adequate breakfast; of the other 90 per cent, one out of every ten had no breakfast at all. The State Nutrition Committee and the State Departments of Health, Education, and Agricultural Service took this to mean that a long-range Good Breakfast program was in order. A two year program is now being carried on throughout the state through newspapers, radio, posters, exhibits, leaflets, and other mass education media, and by county health departments giving such material to clinic patients, to families during home visits, to schools and other groups. The state health department is integrating the program in its nutrition activities.

An interim report, with charts, pictures, etc., about this program is available from Estelle Ingoldsby, Chairman,

State Nutrition Committee, State Department of Health, Charleston, W. Va.

WHAT SHALL CHILDREN LEARN ABOUT FOOD

In Union County, Florida (with a population of less than 10,000 and part of a tri-county health department), school health examinations revealed that nutrition was among the urgent problems needing attention. Instead of teaching the general theme "Good food is good for everybody; we should eat more of it," a study was undertaken to find what children were eating and in what respects each child's food was deficient. For three days all children in the third to seventh grades reported on what they had eaten. How the study was carried out, what it showed and what some of its health education by-products were is told in "What Shall We Teach Our Children About Food," available on request from Nutrition Investigations and Services, Florida State Board of Health, Box 210, Jacksonville, Fla.

OFFICIAL LANGUAGE NEEDN'T BE STUFFY

The Cancer Control Letter of the National Cancer Institute reached its 9th issue on August 17. It is written in refreshingly simple language that somehow manages in itself to satirize the gobbledygook too often found in official documents. Has a lot of valuable information and is presumably available from National Cancer Institute, Washington, D. C.

WORTH ACQUIRING

The Role of the Voluntary Health Agency in Promoting Public Health Services in Iowa is by George Nelbach, recently moved up from Secretary to Consultant of the New York State Committee on Tuberculosis and Public Health. An address made at the 1948 meeting of the Iowa Tuberculosis and Health Association, it may well be thought of as the Bible for voluntary

health agencies in their relationships to the development of official community health services. It outlines the functions of a full-time health department and, with appropriate illustrative stories, what are the principles and minimum personnel on which a local health department should be set up as outlined in Haven Emerson's *Local Health Units for the Nation*; with special reference to the Iowa situation; the widespread professional and citizen interest in extending local health services; and finally, a bit of New York State experience. Published by and presumably available from Iowa State Tuberculosis and Health Association, 2124 Grand Avenue, Des Moines 12, Iowa.

"Recent Amendments of the U. S. Public Health Service Milk Code," published in the *Journal of Milk and Food Technology* for May-June, 1948, by A. W. Fuchs, discusses changes approved by the Milk and Food Sanitation Advisory Board, U. S. Public Health Service, to the 1939 edition of the *Milk Ordinance and Code* recommended by

the Service. Reprints available from Mr. Fuchs, U. S. Public Health Service, Washington, D. C.

"Nation-wide Inventory of Sanitation Needs," Supplement 204 to the *Public Health Reports* is the report of the 1947 U. S. Public Health Service survey of nation-wide sanitation needs. This survey disclosed a need for water supply and sewage disposal facilities costing \$7,834,581,000, including water supply systems for 5,710 communities now without central systems; improvements and extension to existing systems of 15,000 communities; attention to the water supplies of 27,000,000 rural inhabitants; complete sewerage systems for 9,100 communities; improvements to existing systems; and coverage of rural populations. In 8,300 communities better collection and disposal of garbage was found necessary. The survey also found that 36 per cent of the facilities to meet community needs are either ready for construction or in the planning stage. Superintendent of Documents, Washington, D. C., 15¢.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

Medicine in the Post War World
—The March of Medicine, 1947—
Number XII of The New York Academy of Medicine Lectures to the Laity. New York: Columbia University Press, 1948. 106 pp. Price, \$2.00.

In these six *Lectures to the Laity* sponsored by the New York Academy of Medicine, the task of providing factual information for the layman is accomplished through presentations which are simple and authoritative, yet neither patronizing nor pedantic. Intended primarily for laymen, they will be interesting and enjoyable to professional workers as well.

The post-war world referred to in the title offers Major General Kirk and Dr. Solomon a good vantage point from which to evaluate medicine's achievements in the past war, and it is apparent that medicine and psychiatry have gained information which will be most useful in adapting valuable techniques for civilian use in the hoped-for peaceful future.

Both Dr. Solomon's lecture on the atom in medicine and Dr. Dubos's discussion of the biotic agents stress the need for continuing scientific investigation to insure a greater usefulness of these agents in the study and control of disease. Dr. Haggard offers a brief and fascinating account of the life and work of Dorothea Dix, and Dr. Spitz provides evidence which emphasizes the great importance to the infant and growing child of the mother's love and affection.

The atom, the biotic agents and psychiatry have been dramatized during the past few years by the press, the

radio, and movies to a degree not always consistent with the facts. It is hoped, therefore, that this informative and stimulating book will have wide circulation among the laity.

HENRY B. MAKOVER

Fundamentals of Human Reproduction—By *Edith L. Potter, M.D. New York: McGraw-Hill, 1948. 231 pp. Price, \$3.50.*

This compact, dynamic book is divided into four sections. The section on background deals with early forms of animal life, general pattern of reproduction, factors responsible for body form and number of offspring. The second section (General Plan) covers sex organs and their function, development of the blastocyst and formation of the placenta and a survey of embryonic and fetal development. Thirteen chapters devoted to development of the various organs form the third part, and the fourth section is devoted to the infant.

The material is very readable and reflects the author's excellent performance as a lecturer. Use of simple analogies, colorful language and interesting comments regarding the rational bases of developmental changes help not only in making all development seem logical and understandable but easier to remember. Comparison of human developmental structures with those of other animals makes evolutionary changes seem more real. The illustrations and photographs are clear and forceful and add much to the clarity of the text. There are also a helpful list of visual aids and a bibliography.

Maternal and child health directors and public health nurses and all others interested in a clear, concise, and interesting text on human reproduction will find this a good addition to their libraries.

MARION HOTOPP

Tifus Exanthematico—By *Dres. F. Fonséca and Fr. Wohlwill*. Barcelona-Buenos Aires: *Salvat Editores*, S. A., 1944. 212 pp.

The last war has of necessity stimulated a revival of interest and of work in the rickettsial field. Several studies have appeared in Spanish, stressing various aspects of the subject. Thus, Del Campo and Gallardo (Madrid, 1943) presented a work on the laboratory phase of typhus fever which surpasses in detail and in illustration anything as yet available in English. The present volume, however, is rather designed for the general medical reader than for the specialist. The authors achieve a balance among such aspects of typhus fever as the clinical picture, laboratory diagnosis, pathology, epidemiology, prophylaxis, and treatment. The sections on symptomatology and on pathology are perhaps the strongest. It is due to no fault of the authors that neither DDT in louse control, nor para-aminobenzoic acid in therapy receives any mention, since these significant developments had not yet been established at the time of writing of the volume. The illustrations have been well selected, and are generally informative.

M. TAGER

Introduction to Human Physiology—By *William D. Zoethout, Ph.D., Professor Emeritus of Physiology in the Chicago College of Dental Surgery (Loyola University)*. St. Louis: *Mosby*, 1948. 424 pp. Price, \$4.00.

In this elementary treatise on human physiology or bodily function an attempt has been made to provide enough information in the basic sciences to

make the work intelligible to a layman. In the first three chapters, fundamental concepts in the fields of physics, chemistry, tissue structure, and biological form and reproduction are covered. The remaining 22 chapters of the book deal briefly and in a simple manner with the main facts of biological function as they apply to man.

Chapter material is divided on the basis of the system or systems of body parts involved and their related functions. Most chapters are provided with an initial paragraph outlining the main points to be dealt with in the chapter. Each chapter presents, in a brief manner, the main facts relevant to the subject. The chapter ends with a series of questions covering the material presented. The book is rather more exhaustive than the usual elementary text on physiology or the related sciences. However, the material presented falls short of the minimum requirements of the medical student and therefore the use of this book is limited to high schools and a few very elementary university courses. The book is well produced and well illustrated (138 black and white and 4 colored illustrations). An excellent index is provided and is more generally adequate than is to be found in most advanced textbooks.

DONALD YOUNG SOLANDT

Pamphlets That Pull—By *Alexander L. Crosby*. New York: *National Publicity Council*, 1948. 32 pp. Price, \$1.00.

A clumsy but more accurate title for this brochure would be "How to Make an Attractive Pamphlet That Has a Good Chance of Being Read." Nowhere is evidence developed to show that pamphlets prepared in accordance with the clear and excellent suggestions given will "pull" better than pamphlets which, prepared by some other methods, produce a less glamorous result. This

guide is based on the assumption long held by advertisers, health educators, and other pamphleteers—that a format which is pleasing to the eye and satisfies the silent ear will produce better results than a production which does not meet these qualifications.

For those who must prepare pamphlets and reports, however, this guide is perhaps one of the best that have ever been published. In its own writing and make-up it brilliantly illustrates the principles which it expounds. It is replete with simple instructions so clearly given that they will be immediately intelligible even to the scientist who, though well versed in his science, has never been trained how to impart his wisdom via the printed page to those who have the misfortune of not being trained in his particular curriculum.

Pamphlets That Pull is the ninth publication in the *How To Do It Series* published by the National Publicity Council. In the library of every health organization which must speak to the public from time to time it should take its place along side of all the other pamphlets in that series.

HOMER N. CALVER

Dental Health Teaching Outline
—By Verne D. Irwin, D.D.S., M.P.H., and Netta W. Wilson, M.A. Minnesota: Bruce Publishing Company, 1948. Price, \$1.00 per set, or No. 1, 20 cents, Nos. 2 and 3, 25 cents each, and No. 4, 30 cents.

Motivation of children to obtain dental care and establish good practices of mouth hygiene is the purpose of the four dental health teaching outlines which have been developed for use in the schools. Prepared as a series for use with children in the primary, intermediate, junior, and senior grades, they should be valuable to school teachers, public health dentists, dental hygienists, school nurses, and others.

The authors, with broad experience

in the field of dental health education, and aware of the need for this phase of education in the schools, have prepared the outlines in a manner acceptable to present-day teaching methods. Recognizing that the integration of dental health education with the general school program is not a simple task for teachers whose background of dental education is somewhat limited, they have carefully prepared the text to include such dental and related information as is necessary and essential for instruction of children at the various grade levels. Also, they have demonstrated in a very practical manner the ways in which this information may be used as a regular lesson, or correlated with other activities of the classroom.

Each outline includes a recommended reading list for both teachers and pupils, and a list of films and other visual aids, together with the costs and the sources from which they may be obtained. The lists add greatly to the usefulness of this series of dental health teaching outlines which public health workers may well recommend.

MARGARET H. JEFFREYS

Veterinary Helminthology and Entomology—By H. O. Mönnig. (3rd ed.) Baltimore: Williams & Wilkins, 1947. 427 pp. Price, \$9.00.

Dr. H. O. Mönnig has increased his contributions to veterinary medicine and public health in the third edition. It has been ten years since the second edition appeared and Dr. Mönnig has brought his book up-to-date and added numerous plates of eggs of helminths of the various domestic animals and birds.

The book is written primarily for veterinary students and practitioners but will have considerable value for public health veterinarians, laboratory workers, and epidemiologists. The host parasite list on pages 405 and 415 will be of real value to public health workers.

Dr. Mönnig has confined his text to

the more common parasites of domestic animals and some wild animals. The *International Rules of Zoölogical Nomenclature* are followed throughout. The student and other interested persons will find a good general discussion and definition of the relation of parasitism and other forms of life, pathogenicity and pathogenic effects, resistance and immunity, and epizootiology.

A concise chapter on how to prepare specimens for clinical diagnosis will be of value to veterinary practitioners, public health veterinarians, and laboratory workers. Attention is given to the diagnosis of external parasites and those found in body fluids and excretions.

The most important content of the book is given over to the discussion of parasitic infections of domestic animals. The most attractive feature of the discussion of the parasites is the manner in which they are presented in the text. The author has followed a definite outline which is brief and readable. The morphology is briefly discussed, followed by the life cycle, pathogenicity, symptoms, diagnosis, post-mortem findings, treatment, and prophylaxis. The only shortcoming of this discussion is the lack of further details on treatment and prophylaxis. Considerable research work in treatment has been going on during the war and post-war years which has not been given adequate attention. The same may be said for prophylaxis where the discussion of insecticides is very brief. The greatest value of this book is its concise treatment of morphology, pathogenicity, symptoms, and diagnosis. For the advanced student there are many more valuable publications.

JAMES H. STEELE

The Issue of Compulsory Health Insurance—By George Bachman and Lewis Meriam. Washington, D. C.: Brookings Institution, 1948. 271 pp. Price, \$4.00.

The most charitable statement that

can be made about this report—which was supposed to evaluate compulsory health insurance versus federal grants-in-aid to the states for the medical care of the indigent—is that it was evidently prepared in some haste. It abounds in irrelevant material, questions raised but left unanswered, contradictions, and repetitions. The authors apparently do not understand the insurance principle, for they imply throughout that it is unjust for healthy persons to participate in a pool with the "bad risks" who are ill.

Haste, however, cannot excuse violation of the fundamental rules of scholarship by the almost complete lack of relevance of the factual material to the main issue and the opinions expressed about it. Conclusions spring fully clad from the authors' minds like Athene from the brow of Zeus. The only clue to their origin is Mr. Meriam's disapproving personal attitude toward social insurance, set forth at length in his *Relief and Social Security* (Brookings, 1946).

Regarding neither care for the needy nor insurance is any attempt made to analyze the wealth of experience available from programs of both types here and abroad. Because they ignore (or are ignorant of) this experience, the authors naively disregard the fact that most of the administrative problems they attribute to national compulsory health insurance—and which, in their opinion, make it undesirable—are common to all medical care programs, voluntary or governmental, national or local, including the ones they approve. In the absence of supporting factual material, the dogmatic conclusions reached are largely meaningless.

Most pages in the report are devoted not to the stated issues, but to a purported review of our health needs, resources, and expenditures. Mortality statistics are discussed at length, although admitted by the authors to be a poor

index of medical need. Rural dwellers, Negroes, the aged, widowed, and disabled are identified as undersupplied with medical care, but their problems are dismissed as basically social and economic—hence their health needs can apparently be ignored. Throughout runs the theme that if people were prudent and really wanted medical care, most could afford it.

The superficiality of this report and the methodology employed does not reflect credit upon either its authors or the Brookings Institution. In fairness, it should be added that the section on supply of personnel and facilities, although scarcely related by the authors to the main issues, is in general a scholarly presentation.

KATHARINE G. CLARK AND
DEAN A. CLARK

Research and Regional Welfare—
Edited by Robert E. Coker, with a Foreword by Louis R. Wilson. Chapel Hill: University of North Carolina Press, 1946. 229 pp. Price, \$3.00.

The University of North Carolina is perhaps the father of what is now generally known as regionalism. As a part of its sesquicentennial celebration in 1945 it held a 3 day conference on research and regional welfare, the papers of which have been published.

In 16 papers by as many authors the contributions of research to the well-being of the South are explored. They add up to interesting and provocative reading. The Foreword recognizes the responsibility of the University, by virtue of its public support, to prosecute "research not only for the discovery of new knowledge, but also for the advancement of the material, intellectual, and spiritual welfare of the public which it serves."

The chapter on Nutrition and Public Health contains 2 papers, Research in Nutrition: Importance to the Public Health, by Russell M. Wilder, M.D.,

Division of Medicine, Mayo Clinic; and Medical Research: The Foundation for Future Progress in Health and Public Welfare in the South, by James Steven Simmons, M.D., Director of the Harvard University School of Public Health.

MARTHA LUGINBUHL

Interesting and Useful Medical Statistics—*Edited by William H. Kupper, M.D. Dubuque, Iowa: Wm. C. Brown, 1948. 528 pp. Price, \$6.50.*

This volume is a collection of approximately 1,000 tables taken from papers published in medical journals. The tables are presented by subject such as absenteeism, accidents, age groups, alcoholism, allergy, etc. The *Journal of the American Medical Association* is the source of more than half of the tables. Other journals drawn on heavily are *Public Health Reports*, *Metropolitan Statistical Bulletin*, and *New England Medical Journal*.

The presentation of such tables without comments regarding the source of the data raises a question of the purpose of the text of the original paper. Usually the text of paper includes a description of the program, study or material, and the interpretation of the data collected and presented in the tables.

Also, review of the tables brings forth questions regarding the characteristics of good tables. The title of a table should acquaint the reader with the data being presented, giving the source of the data, when, and where the data were gathered. These tables indicate that scientists would benefit by study of the book by Walker and Durost* entitled *Statistical Tables, Their Structure and Use*.

Some of the tables in the volume are excellent and are readily understood because of completeness of titles and be-

* Walker, H. M., and Durost, W. N. *Statistical Tables, Their Structure and Use*. New York: Teachers College, Columbia University, 1936.

cause the data are for the United States or for areas for which the method of collection of data is well known. Some of the tables are for limited periods of time, such as case reports for a few weeks, and others are for small experiences. The tables in this collection are selected ones and cannot be said to give typical or representative data on a given subject.

Because of the lack of description of the material and the dangers of improper use and incorrect interpretation, this collection of tables is not recommended for use by scientists.

RUTH R. PUFFER

Health in Your Daily Living—
By Josephine L. Rathbone, Francis L. Bacon, and Charles H. Keene, M.D.
Boston: Houghton Mifflin, 1948. 442 pp. Price, \$2.60.

Health in Your Daily Living has from all apparent evidences been written for young people in high schools. It is an interesting and attractive textbook, meeting most of the requirements demanded by teachers who are making selections of health textbooks. Such requirements which are here met include accurate, reliable content, interesting readable script, with a selection of topics of interest to the intended age group, and illustrations and graphs which engage the interest of the reader as well as clinch points made in the text. The glossary is complete and the teaching aids are excellent. Pre-tests of materials to be presented might have been added which would assist the teachers in selecting points for emphasis in class.

Since there is no mention of a supplement in which the reproductive system and its function have been mentioned, it is safe to assume that this important subject again has been omitted. The reviewer hopes that some day an author and a publishing company will have the courage to include in a text this all important problem, giving it its rightful

place among the other topics thought to be vital to the welfare of our high school youth.

Educators should carefully consider this excellent text when selecting health textbooks.
A. L. BEAGHLER

The American Year Book—*Edited by William M. Schuyler, with numerous contributors. New York: Thomas Nelson, 1948. 1125 pp. Price, \$15.00.*

"Contemporary thinking on epochal events" in the United States of America in the year 1947 is presented in this 33rd annual issue of the *American Year Book*. These events are within the fields of government, economics and business, social conditions, science, and the humanities.

Here we have epitomes of high lights, developments, and factual data much of which provide most useful reference material for public health workers. It is not a simple task to review an encyclopedia, but the following condensed notes are suggestive of the breadth of content.

Seventy-eight additional cities adopted the council-manager form of government. Expenditures for welfare services increased in spite of high employment. Cities are consolidating departments. James F. Byrnes resigned as U. S. Secretary of State on January 8. The Massachusetts legislature rejected an act making the Civil Service law applicable to county employees. The United States consumes 15 times as much oil per capita as Great Britain. The largest single sunspot ever recorded appeared in March, 1947. Motor busses are supplanting street cars. "The Winslow Boy," following a huge success in London, moves to New York. There are 6,300,000 students in the secondary schools of the United States. Six states now have a \$2,400 minimum salary for teachers. The travel literature for Europe is still sparse. A new disease entity is given the name "rickettsialpox."

A National Conference on Local Health Units was held at Princeton University in September. Relationships between Blue Cross organizations and hospitals have been strained for some time. The position of streptomycin in the therapy of infections was clarified during the year.

Forty-six national learned societies have participated in the production of this useful encyclopedia. A 36 page index, covering subject matter and authors' names, permits one to "get at" the material readily.

Dr. William R. Willard, Assistant Professor of Yale University, School of Medicine, is author of the 8 page section on Public Health, and Dr. Halbert L. Dunn, Chief of the National Office of Vital Statistics, provides 10 pages on the latest available vital statistics.

While sunspots and leading motion picture productions may not be related to public health, the trends in government, business and science are unquestionably matters of prime importance to the expansion of public health programs.

GEORGE T. PALMER

Water Purification Control—By *Edward S. Hopkins*. (3rd ed.) Baltimore: Williams & Wilkins, 1948. 289 pp. Price, \$4.00.

The introduction of this book is noteworthy. It gives a historical outline of water treatment, with Louisville experiments credited with the basis for scientific control. The author has missed no detail in water treatment practice; all kinds of coagulants; the when and how to use them; pH control is clearly stated; the filtration chapter is complete; collecting systems are well described, but relative advantages are not pointed out; disinfection by chlorine and caustic alkalinity are given space relative to their importance. The disadvantages of ozone and R.U.V. in carrying residuals into the system should have been noted. Control of micro-

organisms is brief but essentials are given and methods in use. Corrosion control in treated and natural waters is well described. Chapters on softening hit high spots of the problems involved, the processes, and equipment. The book gives nothing on bacteriological tests other than a chapter, "Plant Control," covering the U. S. Public Health Service drinking water standards, the value of chemical tests, record keeping, plant maintenance, and cross-connections.

Each chapter is well annotated for one who wishes to delve more deeply into the various subjects treated. An excellent book for the large as well as the small plant operator, and one from which the designing engineer could profit. It is a well written book which covers the field thoroughly.

THOMAS R. LATHROP

Rural Health and Medical Care—By *Frederick D. Mott, M.D., and Milton I. Roemer, M.D., M.P.H.* New York: McGraw-Hill, 1948. 610 pp. Price, \$6.50.

A valuable pioneer study of a most important problem.

Comparative statistics for urban and rural populations, cited in early chapters, seem to the reviewer of doubtful value; but the National Youth Administration studies, later quoted, demonstrate beyond question the presence of a relatively high proportion of specific physical defects (such as carious teeth, diseased tonsils and underweight) in rural youth. Even on the assumption that the health problems of rural and urban populations are not widely different, there is a shocking lack of medical care in the farm group. The authors cite figures which show 876 persons per physician in the country as a whole, while the figure for 8 states which are over 70 per cent rural is 1,428; and for the counties in these states which have no urban center, the ratio rises to 2,256

persons per physician. In these purely rural areas, nearly half the physicians are over 56 years of age.

Hospital beds average 3.5 per thousand population for the country as a whole; and 2.2 for the 8 predominantly rural states. Similar discrepancies appear in regard to dental personnel and nursing personnel; but it is noted that undertakers are quite evenly distributed in different areas.

The reasons for these deficiencies are partly geographical and organizational, but mainly economic. The per capita expenditure of the average urban family for medical care in 1941 was \$26.76; of the average farm family, \$14.37.

In the last third of this volume, Mott and Roemer discuss possible remedies for the situation. They discuss the Farm Security Administration program of medical care for rural areas which reached its peak in 1942 (largely under the leadership of the senior author); and show how this program succeeded in bringing needed medical care to tens of thousands of farm families; and how its value was limited by the relatively small and unfavorably selected group of families served, the small financial contributions which could be provided by low income farmers, and the high cost of a fee-for-service program. Later experiments with a better organized program (not limited to low income families and with additional subsidy) in 6 southern and western counties gave much more promising results. Experience with various voluntary insurance plans is then reviewed which indicates—as might have been expected—that such plans cannot reach the lowest income groups and inevitably tend to increase costs by selection of families and groups who are poor health risks.

The authors point out the importance of general social and economic measures which will increase the earning power of the farm population, the need for rural health and hospital facilities,

and for basic public health services. They conclude, however, that the fundamental approach to a solution of the problem must be the establishment of a national system of compulsory health insurance. Such a system would provide needed care for all and apportion the cost to family income, "the only effective way to apply the time-honored sliding scale principle." The sole alternative possibility is a medical care program, like that proposed in other countries, financed directly from tax funds, which the authors consider too radical a step for us. Their figures show clearly that, while a universal contributory program could be financed by such prosperous states as California and New York, it would be completely out of the reach of the rural states which need it most.

Mott and Roemer conclude that "In all nations the economic problems of medical care have been faced and the development of social insurance has become almost historically inevitable in the path toward their solution. With this central economic measure, other steps toward a total health program will be on firm ground. The goal of the plain people on the farms and in the villages of America will cease to be a vision and will be attained. When the steps clearly within our power are taken, we can be certain that the gap between the technology of modern medicine and its social application will be closed."

C.-E. A. WINSLOW

Physiology of Exercise—By Lawrence E. Morehouse, Ph.D., and Augustus T. Miller, Ph.D. St. Louis: Mosby, 1948. 353 pp. Price, \$4.75.

This is a useful monograph upon a subject which advanced so much just before and during the war as to render previous summaries in review journals and in book form out of date.

To a large degree much of the experimental work recounted was done in the Fatigue Laboratory at Harvard. One

is not surprised, therefore, that the idea that motivates the book consists in an effort to describe the functional powers of man by centering upon the way in which he meets the requirements of exhausting exercise, not only when untrained and trained, but also under trying environments of heat and cold.

The authors are interested in describing the reactions of the body to hard work on the treadmill or under standardized laboratory conditions. The best feature of the book is the readable and well documented manner in which these descriptions of performance are given. No one can expect that, in a short monograph, all aspects of an experience so broadly affective as hard physical work can be treated with equal success. A monograph should convey the interests and conclusions of men who have worked in a subject. It is a short cut to information, not a compilation of data and references which weight the reader with the necessity to undertake wide research in literature, listed comprehensively, but not with critical insight.

The authors have fulfilled this requirement. Exercise means muscular work and, systematically, the structure, physiology, and biochemistry of muscle are described, and then the adaptations of circulation and breathing, which must accompany muscular work. Later chapters deal with "Skill," "Endurance," "Fatigue," "Training," "Environmental Temperatures"—all the considerations involved in physical performance. Each of the 30 short chapters is followed by a brief and well selected bibliography.

The book should be useful to all students who have had a year or two of training in physiology and biochemistry. Applied science is usually considered a simple version of basic matters. This is a great mistake. Those who can apply scientific methods most successfully, think in and talk the language of science

without effort. To the reasonably prepared mind in colleges and professional schools, this small book will prove a useful resource. CECIL K. DRINKER

Life Insurance Medical Research Fund—Third Annual Report, 1947. New York: Life Insurance Medical Research Fund, 1948. 95 pp.

Public health workers ought to know about the Life Insurance Medical Research Fund which was organized in 1945 by a group of United States and Canada life insurance companies representing most of the business done in North America. The resources of the Fund are derived from contributions made by company members in proportion to the volume of their business. The purpose is the support of medical research with the ultimate objective of increasing life expectancy, and the resources of the Fund are now devoted to the support of fundamental research on problems of the heart and blood vessels.

A board of outstanding physicians makes up the Advisory Council and guides the grants which in 1947 included nearly 100 research programs and about 35 fellowships. More than \$580,000 was awarded in grants and fellowships during 1947, bringing the total since organization of the Fund to more than \$1,250,000.

A review of the projects themselves is rewarding. Among the list are some classified under the heading "The Prevention of Disease." These include metabolic production of arteriosclerosis; streptococcus, rheumatic fever, and nephritis; the roles of diets and hormones; protein intake and hypertension; streptococcal infections; streptococcus growth products, and other subjects.

The Life Insurance Medical Research Fund represents an important new approach to medical research. It is to be hoped that the federal program of

grants-in-aid for medical research will supplement and not replace ventures of this kind, as has been recommended in the Steelman Report.

400 Years of a Doctor's Life—
By George Rosen, M.D., and Beate Caspari-Rosen, M.D. New York: Henry Schuman, 1947. 429 pp. Price, \$5.00.

400 Years of a Doctor's Life is not a history of medicine, but, as the authors point out, an anthology of biographical material about and by representative men active in the field of medicine from the 16th century to the present time. It is not a history book but rather a story book, but unlike most stories with a limited number of characters, it contains 162.

It is, for this reason, excellent bedside table reading, for it lends itself well to the frequently interrupted type of literary browsing.

The short, interesting, pertinent, and concise statement introducing each new biographical vista into the life of the composite 400 year old doctor is a good setting for each component part.

The reviewer is sure that this anthology will stimulate many to read more fully in the sources from which these delightful samples were taken.

A. L. BURGDOFF

Citizen Participation in Government—A Study of County Welfare Boards—
By Helen E. Martz, Ph.D., Introduction by R. Clyde White. Washington, D. C.: Public Affairs Press, 1948. 63 pp. Price, \$1.00.

Public health workers are quite aware of today's high interest in gaining citizen participation in health affairs. In this study they will find outlined some of the weaknesses and the strengths of such participation as discovered in the welfare field. It may serve only to deepen the convictions of some that lay involvement in activities that are essen-

tially professional prerogatives is at the least a vexatious irritation. However, more objective persons will learn from the study how they can effectively utilize this potent source of support.

While much has been written about citizen participation in the nonofficial health field, there has been relatively little attention given to it in relation to the official health agency. Because there is an apparent trend toward more lay appointments on boards of health, the subject of this study is of increasing significance to health officials. It may be remarked parenthetically that some professional members of boards of health may be, in matters of public health administration, in much the same position as the lay citizen.

The 63 page pamphlet is a summary of a detailed study, and as such will appeal to the busy professional who has little time to digest minutiae. A 10 page summary and conclusions section is well done. Many will find the rather extensive bibliography of value. The study warrants a better print job than it has received.

JOHN W. FERREE

Victorian Order of Nurses for Canada — Fiftieth Anniversary —
By John Murray Gibbon. Ottawa: Victorian Order for Nurses for Canada, 1947. 124 pp. 32 illus. Price, \$2.00.

This book is a factual story of the services provided by the Victorian Order of Nurses in Canada during the 50 years since the inception of the Order. The book is well illustrated with pictures dating back almost to the beginning of the Order. It tells the story of hardships encountered by nurses beyond the frontiers of civilization in Canada and shows their ingeniousness in carrying out many arduous tasks in spite of almost insurmountable obstacles.

The book is rather difficult to read, most of the material being quotations from letters and other documents on file at the central office.

It is apparent that the original activities of the nurses, which were mostly in communities where no other form of medical service was available, have now developed into the accepted pattern of bedside nursing, namely a nursing service in communities where medical service is available and only under the supervision of a qualified medical man. One questions whether or not the service now being provided by the Order is the type of service that was originally visualized by the founders of this excellent nursing service. F. W. JACKSON

Handbook of Communicable Diseases for the Use of Medical Officers of Schools—By Medical Officers of Schools Association. (11th ed.) London: J. and A. Churchill, Ltd., 1948. 71 pp. Price, 5 s.

It is interesting to compare the British procedures with our own regulations for communicable disease control. This eleventh edition which had its origin 62 years ago in a code of rules is published by the Medical Officers of Schools Association, which has no counterpart in America. Since the last edition in 1940 they have adopted the format of the booklet *The Control of Communicable Diseases* by the American Public Health Association which had involved consultation with the medical staff of the British Ministry of Health, and they have added a new item "Return to School." The statements are the work of a committee of 7 which met on 10 occasions. The preface to the first edition is also included. This was based on "an elaborate series of questions" and revealed "curiously divergent" procedures when dealing with the same conditions of disease. It would seem that we might profit in this country today from such an inquiry as was made by the British Medical Officers of Schools Association in 1884.

Naturally the differences from policy in the United States are most notable

when compared with our more recent changes in rules which have recently been made less restrictive and less expensive than formerly, and where our knowledge is limited. For example, the code calls for:

Chicken pox—isolation and exclusion of patients from school until every primary scab has fallen off and the skin lesions have healed. Return to school at the end of isolation. No mention is made of contacts.

Measles—the period of isolation extends until catarrhal symptoms cease and the minimum period before return to school seems to be 10 days from the appearance of the rash, with no mention of contacts.

Pertussis—in the discussion of the period of communicability we find infectivity rapidly diminishes at the end of the catarrhal stage and freedom from infection may be demonstrated as early as the 21st day after onset, and yet isolation from susceptible children and exclusion from school is recommended for 4 weeks from onset, or until proved free from infection by bacteriological examination. Further restriction is recommended for those exposed who develop a cough, and under epidemic conditions non-immunes are excluded from school for 14 days after their last exposure to a recognized case.

Ringworm of the scalp—under the heading "return to school" we find the ultimate in non-committal policy, i.e., "If isolation has been considered necessary, as soon as it is considered unnecessary."

Scarlet fever is a notifiable disease but not septic sore throat nor streptococcal tonsillitis. The recommendation "return to school" does not specify whether it applies only to the erythrogenic conditions or not, but does indicate that there must be no sore throat, discharge from the ear or nose, suppurating or recently enlarged glands, and a negative swab is usually obtained.

No mention is made of contacts except the recommendation under "General Measures"—"Daily examination of throats and temperatures. Swabbing both nose and throat where doubt exists."

Apparently these general recommendations from the British Medical Officers of Schools are in some ways more strict than our more recent proposals, which have been designed to avoid restrictive measures that have not been effective, and they are less restrictive in other ways than most of the policies attempted by well organized health departments in the United States. This handbook, however, expects the medical officer to decide whether a person will be isolated when "suspected of having or incubating an infectious disease," and "the school doctor should possess undivided responsibility in dealing with the circumstances" of infection and its control and in dealing with the sick.

HAROLD H. MITCHELL

Sex Variants: A Study of Homosexual Patterns — *By George W. Henry, M.D.* New York: Hoeber, 1948. 1000 pp. Price, \$8.00.

This single volume edition of a two volume study originally published in 1941 reports an investigation undertaken at the request of the Committee for the Study of Sex Variants. Sixty

detailed case histories have been selected from among 200 individuals studied, representing both sexes and including bisexual, homosexual, and narcissistic cases of a great variety.

Public health workers are aware of the confused approach to cases of homosexuality by the public and by the medical and legal professions. This book will be significant to them because it brings together a larger number of cases in an exhaustive way than would ever be encountered in ordinary practice. The reporting is thoroughly objective and includes studies of family backgrounds, heredity, and childhood experience as well as of adult behavior. Although this volume does not emphasize methods of handling homosexual cases, it does point up the necessity of sound procedure to avoid the stupidly ineffective measures so often employed. It throws light on problems of child guidance which if well handled can prevent the fixing of variant sex patterns that are socially undesirable. The author is to be commended for the most thorough study of its kind. The volume represents the best present source for orientation of physicians, nurses, social workers, and lawyers. There ought now to be a study of the most effective handling of homosexual cases.

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

News—Barring catastrophe, it is likely that the 1948 death rate will be as low as, or slightly lower than, the 1947 rate which was the lowest previous record.

ANON. 1948 May Set New Low Mortality Record. Stat. Bull. (Met. Life Ins. Co.) 29, 7:3 (July), 1948.

First Fruits—Continuing decline in mortality from cancer among women is the most encouraging aspect of that still grim picture.

ANON. Improvement in Cancer Mortality among Women. Stat. Bull. (Met. Life Ins. Co.) 29, 8:2 (Aug.), 1948.

Nothing Nutritionally Significant Is Lost—Two engineers say that health officers are justified in recommending pasteurization of all milk. Though this will come as no surprise to you, perhaps you will want the reference for your files.

ANDREWS, J., AND FUCHS, A. W. Pasteurization and Its Relation to Health. *J.A.M.A.* 138, 2:128 (Sept. 11), 1948.

Existing Breast-Feeding Patterns—Here's a statistic you may want to use. In a nation-wide survey of lying-in hospitals it was found that a third of the infants were on bottle feeding at time of discharge from the hospital. There were striking regional differences. In the Northeast 60 per cent were weaned to the bottle, whereas only 18 per cent were so weaned in the South.

BAIN, K. The Incidence of Breast Feeding in Hospitals in the United States. *Pediatrics*, 2. 3:313 (Sept.), 1948.

Some Do—We know a lot more about school children's health; we have improved means of maintaining their health; now all that remains is for us to do something about it.

BAUMGARTNER, L. The New Look in Health for Children of School Age. *Pub. Health Nurs.* 40, 9:444 (Sept.), 1948.

Human Understanding Needed—My uninformed guess is that this study (of the sort of help new parents want over and above what they are likely to get from existing lying-in hospital services) is a revealing and suggestive document. It may be "old-stuff" to pediatricians and nurses steeped in infant hygiene lore, but I doubt it.

CLAY, A. S. Guidance in Maternal and Infant Care Two Months before and after the Birth of the First-Born. *Pediatrics*. 2, 2:200 (Aug.), 1948.

Infant's Rights—This is my idea of a swell paper. Spades are called you've guessed-it. Chips fall you-know-where. There's red meat in every paragraph.

Mostly it's about better rural maternity services. The means are at hand—if we have the vision.

DAVIS, M. E. Trends in Maternal Health. *Pub. Health Nurs.* 40, 9:450 (Sept.), 1948.

Two-Thirds Have Done Something—Half a century has passed since the first state law to solve the cancer problem was enacted (in New York). The legislative flood that has poured over the dam in the intervening 50 years is reviewed. Surprisingly enough, more laws are needed.

DEIBERT, A. V. A Half Century of State Cancer Legislation. *Pub. Health Rep.* 63, 35:1128 (Aug. 27), 1948.

High Aims: High Attainments—We know a health council can integrate the planning of all health organizations, thus preventing overlapping. It can survey needs, and establish a well balanced community program based on revealed needs, through stimulated public participation. So says this writer.

FERREE, J. W. Health Councils and Their Potentialities. *Pub. Health Nurs.* 40, 9:461 (Sept.), 1948.

Homely Simile—" . . . even during its infancy, it is already evident that health education will reach the stature of a giant. When a child shows such rapid growth, its parents must be resigned to buy it new sets of clothes more frequently than they would like to."

GILBERT, J. Public Health Education in Local Health Departments. *Canad. Pub. Health J.* 39, 8:325 (Aug.), 1948.

Dangerous Thoughts—A Britisher's thesis: if we want to prevent we must treat, and to treat effectively we must provide for early diagnosis. He answers nine questions about what a productive health service should be like. If you are intrigued by a viewpoint as wide of ours as the Atlantic, you'll hunt out this dissertation.

HASTINGS, S. A National Health Service. M. Officer. 80, 11:111 (Sept. 11), 1948.

Definitive Is the Term for It— This is the sort of review article that does everyone good. We should have more of them. The man who knows best explains just where streptomycin stands among the five categories of remedies for tuberculosis.

HINSHAW, H. C. Antibacterial Drug Therapy in TB. Bulletin (N. T. A.) 34, 8:119 (Sept.), 1948.

No High-Flown Theory Here— Perplexing problems of policy that plague a health officer during a polio epidemic are pondered o'er productively.

KITCHING, J. S. The Health Officer and Poliomyelitis. Canad. Pub. Health J. 39, 8:310 (Aug.), 1948.

Since the "Year of Revolutions"—More historical references for you when you want them. This covers the hundred years that have passed since the first Public Health Act which caused public health to become a national responsibility (in Great Britain).

Public Health in Foreign Periodicals

GEORGE ROSEN, M.D., PH.D.

HEALTH conditions in the Balkans have long been deplorable, and particularly so in Rumania. Underlying and interrelated with these conditions are a welter of social and economic problems, chief among them rural poverty and ignorance. Such knowledge of health and disease among the Rumanian people as was available prior to World War II was at best spotty and likely to be misleading when the whole population of the country was considered. With the cessation of hostilities it was realized that the time had come to undertake a comprehensive investigation of the social biology of Rumania. Late in 1946, therefore, at various sessions

of the Rumanian Academy of Medicine, G. Banu, professor of social medicine at Bucharest, presented a plan for such a project, as well as the results of a number of preliminary studies that he and his coworkers had already undertaken.

A PLAN FOR STUDYING THE BIOLOGY OF THE RUMANIAN PEOPLE¹

Banu begins by emphasizing that the biology of the Rumanian people is still very inadequately known. Statistical data from the various regions of the country are as yet lamentably incomplete. From the figures that are available, it would appear that the problems

of infant mortality and the protection of childhood are exceedingly urgent and demand immediate attention. Furthermore, the incidence of such communicable and social diseases as tuberculosis, syphilis, malaria, pellagra, cancer, endemic goiter, trachoma, and alcoholism is at a much higher level than in the countries of Western Europe.

In dealing with these problems, insists Banu, regional differences must be taken into account. Any health plan that may be devised must be flexible enough to deal with special regional matters. In general, however, particular emphasis should be placed on demography and eugenics, child welfare, control of communicable diseases, and improvement of living standards (nutrition, housing, education). Finally, he recommends that the Rumanian Institutes of Hygiene should immediately undertake to study problems of social pathology, health education, and sanitary engineering. In these efforts they should be supported by the Academy of Medicine. These studies could then serve as a firm foundation for a national public health organization.

REGIONAL CHARACTERISTICS OF INFANT MORTALITY IN RUMANIA²

Rumania is characterized by a high infant mortality. In 1927, the infant mortality rate was 17.8 (per 100 live births) in Rumania, as compared with 8 in Belgium and 3.8 for Holland. Infant mortality is higher in rural areas than in towns. In 1940, it was 18.5 in the former and 17.2 in the latter.

Banu attributes the high infant mortality to four causes. Most important in this connection are congenital abnormalities and debility. Thus, infants dying during the first month account for one-half the total deaths reported in the first year of life. Premature birth and obstetrical mishaps also play a part here. Second in significance are the medical causes of infant mortality; that

is, respiratory diseases, nutritional disturbances, gastrointestinal infections, and cutaneous diseases. Another important factor is the lack of medical assistance during childbirth. Only 30 to 50 per cent of Rumanian mothers are assisted by doctors or midwives during labor. Absence of medical attention during the first year of life adds still further to the high mortality. Finally, social factors are involved in this situation. Thus, the infant mortality rate among the poorer classes is three times as great as that found in well-to-do groups. Significant social factors are income, quality and quantity of food, housing, and working mothers.

In order to reduce infant mortality, Banu proposes a planned campaign based upon the preceding analysis. This would require satisfactory statistical data, organization of the campaign against pathological conditions so as to take into account regional variations, proper provision of medical care during labor and during childhood, and finally improvement of living conditions for mother and child.

RECRUITS—A CRITERION FOR THE STUDY OF THE BIOLOGY OF A POPULATION³

Banu and Dinu call attention to the public health significance of statistical data on military recruits. These data are important because the recruits are an expression of the biological and social environment from which they come, and can therefore give valuable information on the demographic, social, and public health problems of Rumania.

Conscripts are called up every year at the age of 20 for military duty. This study, the first of its kind in Rumania, was carried out over a 7 year period (1941–1947). During the years 1941 to 1946, it was found that from 32 to 35 per cent of those due to report for military service were dead. These percentages showed considerable regional variation. The mortality was much

greater in rural districts (33.8 per cent) than in urban areas (28.4 per cent). This inequality is an expression of the variation in the living standards of different regions, and in the application of public health practices.

Of the recruits examined during the 7 year period, 1941-1947, 5.9 per cent were rejected. On breaking down this overall figure, it was found that of those called up from urban areas 10.2 per cent were rejected, while among those from rural areas, 5.9 per cent were rejected. The causes of rejection, in order of importance, were tuberculosis, congenital and acquired malformations, mental diseases, diseases of the nervous system, surgical diseases, deaf-mutism, dwarfism and infantilism, developmental defects and general debility, eye diseases, and goiter.

REGIONAL CHARACTERISTICS OF ROMANIA WITH REGARD TO INFECTIOUS DISEASES⁴

In this study, Banu and his coworker, Rugina, undertook detailed analyses of morbidity and mortality statistics for infectious diseases in Rumania. As in the investigations noted above, there is considerable regional variation in morbidity and mortality. Regarding the factors which determine this variation, there is an undeniable correlation between standards of living and availability of public health facilities on the one hand, and the level of morbidity and mortality on the other. Areas that have a low standard of living and poor public health facilities tend to have the highest morbidity and mortality rates.

During the 5 year period 1935-1939, the mortality figures in the provinces ranged from 94.4 per 100,000 in Moldavia to 41.7 in the Banat. Similarly for the administrative departments the figures varied from 121.7 in Tecuci to 28.7 in Timis. In addition to the overall figures, separate analyses were made for typhoid fever, scarlet fever, measles,

and whooping cough. The general trends were the same as for the overall figures. To cope with this problem, an extensive campaign of prevention based on precise factual data is proposed. Such a program must take into account the conditions found in different regions.

CONTRIBUTIONS TO THE STUDY OF THE BIOLOGY OF THE WORKING WOMAN⁵

In the summer of 1945, Banu and Sapira undertook a medico-social study of 512 women workers from seven factories in Bucharest. These women were employed in the following industries: textiles, food, leather goods, electrical, cardboard boxes, and cosmetics. The study was based on a detailed questionnaire which dealt with the family history, economic and social conditions, literacy, past and present medical history, working conditions, number of children according to age, and medical and social status of the children. This was supplemented in each case by a clinical examination.

The age distribution of the group shows that 1 per cent was between the ages of 10 and 15, 10.2 per cent in the 15 to 20 age group, and the largest number, 23 per cent, was in the 20 to 25 group. After 40 years the percentage employed fell steeply. The women aged 20 to 40 years made up 70.7 per cent of the total.

Of the 512 women in the group, 46 per cent came from towns and 54 per cent from rural areas.

In regard to personal hygiene, it was found that 60 per cent of these women workers take their bath weekly, either at home or at the factory.

Analysis of other medical histories showed that 43.5 had suffered from acute infectious diseases (diphtheria, scarlet fever, and typhoid fever were most common), 14.3 per cent from surgical conditions, 12.5 per cent from pulmonary conditions exclusive of tuberculosis, 11.7 per cent from gynecological complaints,

and 10.4 per cent from ear, nose, and throat conditions. Other diseases listed concerned the gastrointestinal tract, blood, urinary passages, skin, nervous system, and the eyes. Of the social diseases, malaria accounted for 22.3 per cent of cases of previous ill health, rheumatic conditions for 10.7 per cent, venereal disease for 5.7 per cent, and tuberculosis for 5.1 per cent. The investigators point out that the figure for venereal disease falls far below the actual situation, owing to the impossibility of obtaining accurate data.

At the time when the investigation was actually carried out, the following medical conditions were found among the 512 women: 8.4 per cent suffered from rheumatic conditions, 8 per cent from pulmonary tuberculosis, 5.1 per cent from cardiovascular conditions, 3.9 per cent from visceral syphilis, 3.3 per cent each from pleurisy and malaria, and 0.6 per cent from sciatica.

In the course of the study it was found that despite various legal prohibitions 63 of the women had already been employed in industry while they were still under 14 years of age. Of all the women, more than 40 per cent had gone to work before the age of 18.

Study of the maternity situation in this group showed that 273 had never had any children. Among the remaining 239 the average pregnancy rate was 2.6 for each woman. The percentage of women with only one pregnancy was 43.5 while 18.1 per cent reported having more than five pregnancies. The rate of abortion was 37 per cent, that of premature births 3.1 per cent.

VENEREAL DISEASES IN RUMANIA AND MEASURES FOR THEIR CONTROL⁶

Nicolau and Theodoresco point out

the considerable increase in venereal disease in Rumania as a consequence of the last war, and consider what can be done to master this problem. The legal basis for venereal disease control has a number of excellent provisions—obligation to obtain treatment, free treatment for those unable to pay, obligatory premarital examination, provision for compulsory hospitalization of recalcitrants. Nevertheless, full benefit has not been obtained from this law because of the laxity with which it has been applied. Consequently, a demand is raised for more stringent application of the law, and for more adequate provision for case finding and treatment. New hospitals and dispensaries are urgently needed in cities and towns. For the prosecution of the anti-venereal campaign in the rural areas the authors propose a system of motorized dispensaries, equipped with all the means needed for case finding and treatment. Finally, stress is laid upon the absolute necessity for a concurrent campaign of health education to explain the nature and consequences of venereal infection, as well as to disseminate knowledge concerning individual prophylaxis.

ASSOCIATION NEWS

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

- Margaret E. N. Beaver, M.D., 618 Rood, Grand Junction, Colo., Director of Public Health, City of Grand Junction
- Aaron W. Christensen, M.D., District 9, U. S. Public Health Service, Box 1530, Dallas 1, Tex., Surgeon
- R. G. M. Ehlers, M.D., Box 712, Court House, Las Cruces, N. M., District Health Officer, Dona Ana County Health Dept.
- Edward C. Love, Jr., M.D., 320 N. Jackson St., Quincy, Fla., Director, Gadsden County Health Dept.
- Lad R. Mezera, M.D., 1539 W. Flower Circle S., Phoenix, Ariz., Asst. Director, Maricopa County Health Unit
- Israel Gitlitz, M.D., Pima Indian Hospital, Sacaton, Ariz., Medical Officer, U. S. Indian Service
- T. Everett Ross, 158 W. Main St., Somerville, N. J., Health Officer, Board of Health
- Elaine A. Schwinge, M.D., M.P.H., Alaska Dept. of Health, Box 960, Anchorage, Alaska, Field Physician
- Frank I. Shih, M.D., Ministry of Health, Republic of China, Wangpu Lu, Nanking, China, Quarantine Expert

Laboratory Section

- Antonio R. Monteiro Filho, M.D., D.P.H., Rua Assis Bueno 37, Rio de Janeiro, Brazil, S. A., Bacteriologist, Hospital de Pronto Socorro
- Ray R. Lowther, M.D., 945 Washington St., Denver 3, Colo., Bacteriologist, Denver General Hospital
- Richard P. Mason, M.D., 3017 S. Buchanan, Arlington, Va., Training in Virus Research, National Institutes of Health
- John C. Swartzwelder, Ph.D., 1542 Tulane Ave., New Orleans, La., Assoc. Professor of Medical Parasitology, Louisiana State Univ., School of Medicine

Vital Statistics Section

- Eva Balamuth, 255 W. 23rd St., New York 11, N. Y., Asst. Research Statistician, New York Heart Assn.

- Archie Blake, Ph.D., 223 N. George Mason Drive, Arlington, Va., Medical Statistician, Office of the Surgeon General, U. S. Army
- Agnes W. Brewster, 4 Burning Tree Court, Bethesda 14, Md., Biometrician, Special Projects Section, Office of Field Studies, Tuberculosis Control Division, U.S.P.H.S.
- Charles R. Council, State Board of Health, Raleigh, N. C., Senior Statistician
- Gertrude M. Cox, M.S., Raleigh, N. C., Director, Institute of Statistics, Univ. of North Carolina
- Margaret E. Drolette, 55 Shattuck St., Boston, Mass., Statistician, Harvard School of Public Health
- J. Harold Furlong, City Hall, Room 14, Schenectady 5, N. Y., Registrar of Vital Statistics
- Thomas V. Gardner, 1943 N. 4th St., Harrisburg, Pa., Head Statistical Accountant, State Dept. of Health
- Virginia C. Gary, 1583 Massachusetts Ave., Cambridge, Mass., Record Consultant, U.S. P.H.S., Tuberculosis Control Division
- Thomas N. E. Greville, Ph.D., P. O. Box 7363, Washington 4, D. C., Principal Actuarial Mathematician, National Office of Vital Statistics, U.S.P.H.S., Federal Security Agency
- Maude M. Holmes, R.R.L., 914 Poplar Blvd., Jackson, Miss., Chief Medical Record Librarian, Mississippi Baptist Hospital
- Hilda LaRocca, 30 Magnolia Rd., Milton, Mass., Epidemiologist, State Dept of Public Health
- Sara A. Lewis, National Office of Vital Statistics, Washington 25, D. C., Biostatistician, U.S.P.H.S.

Opportunities Wanted

Woman physician well trained in internal medicine and public health; three years with health department of eastern city; four years, student health department, college for young women; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Public health dentist; B.S., D.D.S., eastern schools; Master's degree in Public Health Dentistry recently received; available immediately; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago 11.

Public health administrator; B.A., M.S., M.D., eastern schools; Master of Public Health, Johns Hopkins; several years director of public health program in foreign country; eight years, professor of preventive medicine and public health, uni-

versity school of medicine; for further information, please write Burneice Larson, Medical Bureau, Palmolive Building, Chicago 11.

Health educator; M.A. in Health and Physical Education; four years, instructor in physical education, liberal arts college; six years, assistant professor, physical education young woman's college; two years on administrative staff, large industrial company in charge of promotional program; for further information, please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

Sanitary engineer; Bachelor's degree; since 1940, department of public sanitation, municipal health department serving as chief chemist and director; for further information please write Burneice Larson, Director, Medical Bureau, Palmolive Building, Chicago 11.

NEWS FROM THE FIELD

THE NATION'S HEALTH, A TEN YEAR PROGRAM

Early in September the Federal Security Agency released a report to the President by Oscar R. Ewing, Federal Security Administrator, consisting of a 186 page summary of the present resources for health, proposed methods of meeting deficiencies, proposed financing of the health program, and various means of solving the health problems facing the nation.

This report takes as its frame of reference the material considered at the National Health Assembly in May, 1948, but the report is not limited to the conclusions of the Assembly, and the Administrator, on his own responsibility, has made bold recommendations beyond those agreed to by the Assembly and for the information of the President and the American people.

Chapter by chapter this report considers the health of the nation, maintaining that every year 325,000 persons die in the United States whom we have the knowledge and skills to save. Bad health, according to the report, accounts for more than 4,000,000 man-years of work lost, and \$27,000,000 in national wealth are lost through sickness, and through partial and total disability.

The report goes on to set a first health goal of increasing supplies of medical manpower until there is enough everywhere in the country to satisfy the health and medical needs of all the people. It is proposed to expand and establish medical schools, training schools, and teaching hospitals until by 1960 the annual production of medical manpower in all categories will have increased by 40 to 50 per cent. Targets for manpower are proposed in each state, based on

levels of medical manpower already attained in the twelve states most adequately supplied.

The second health goal seeks to assure that there are enough hospital beds of all kinds everywhere to meet the people's needs and to finance hospitals so that they may give the highest quality services. The total beds should be doubled, adding at least 600,000 beds by 1960. It is proposed that auxiliary health and community centers should be built, particularly in rural areas, and that hospitals and health centers should be united into regional chains so that the most remote regions will have full access to modern medicine.

The third health goal seeks to assure that every individual without regard to his economic status has full access to adequate medical services for the prevention of illness, the care and relief of sickness, and the promotion of a high level in physical and mental health. The conclusions of the planning committee of the Medical Care Section, National Health Assembly, are reproduced. A national plan of sickness insurance is proposed. This goes well beyond the area of agreement reached at the National Health Assembly.

The fourth health goal focuses attention on mental health as the leading area needing medical progress in the second half of the present century. Research in the field of psychiatry should be promoted, as well as in the mental-emotional aspects of physical illness. Manpower facilities for both preventive and curative work in mental health throughout the country should be expanded.

The fifth health goal proposes that everyone in the nation be enabled to enjoy a healthy, active, and productive

maturity. Chronic disease is presented as the greatest single barrier to achievement of this goal. The change in the age composition of our population is emphasized and the various causes of death from chronic diseases are presented.

The sixth health goal proposes to rehabilitate the 250,000 men and women who become disabled through illness or injury every year so that they can be restored to the most nearly normal life and work of which they are individually capable.

The seventh health goal seeks to assure to every child in the country the utmost degree of health, defined as a condition in which all his physical and mental powers are functioning at their best. It is proposed to do this through a national plan that will build progressively toward complete medical care and social, psychological and health services for all children and for mothers in childbirth.

The eighth health goal represents planning and action in every community in every state directed toward providing the best possible health conditions for all people by assuring adequate local supply of needed services and by organizing the local agencies of health, the doctors, hospitals, public health departments, and voluntary groups into effective teamwork for the welfare of the entire community.

The ninth health goal is to establish everywhere local health units with full-time qualified staffs adequate for the needs of the population; to increase and improve the training of public health workers to the end that their number shall be doubled as rapidly as feasible. An expansion of the present system of federal grants-in-aid through state health departments is proposed in the amount of an immediate increase to \$40,000,000 annually, which by 1953 should rise to \$53,000,000.

This report, attractively presented,

is available from the Superintendent of Documents in Washington at the price of \$1. It should be read in the original by every public health worker who will see goals toward which he has worked restated by a responsible federal official who has projected the entire public health program to a new level of public acceptance. Readers of the report may differ as to the advisability of means proposed but, with the exception of the methods advocated for sickness insurance, the means are in general in line with those proposed by the National Health Assembly.

REGIONAL OFFICES FOR FEDERAL SECURITY AGENCY

The ten regional offices for the Federal Security Agency, announced by Administrator Oscar Ewing in July, are now in operation. The field activities of all the units of FSA—U. S. Employment Service, Children's Bureau, Public Health Service, Office of Education, Food and Drug Administration, Office of Vocational Rehabilitation, and Bureau of Employee's, Compensation—will be coordinated in the agency regional offices. Heretofore, the various units established their own regional offices with varying boundaries.

In announcing the ten regions, Federal Security Administrator Ewing said, "The various programs of FSA form an integrated pattern for the nation's health, education, and social security. I hope that for the general public the regional offices will become widely known as a source of information about the many programs administered by FSA.

The regions, the states covered, the regional directors, and headquarters are as follows:

- I. Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island — John F. Hardy, Boston, Mass.
- II. New York, New Jersey, Pennsylvania, Delaware — Joseph B. O'Connor, New York, N. Y.

- III. Maryland, District of Columbia, Virginia, West Virginia, North Carolina—Erval R. Coffey, M.D., Washington, D. C.
- IV. Michigan, Ohio, Kentucky—J. Kimball Johnson, Cleveland, Ohio
- V. Minnesota, Wisconsin, Illinois, Indiana—Ed McDonald, Chicago, Ill.
- VI. Tennessee, Mississippi, Alabama, Florida, South Carolina, Georgia—Richard H. Lyle, Atlanta, Ga.
- VII. North Dakota, South Dakota, Nebraska, Kansas, Iowa, Missouri—James W. Doarn, Kansas City, Mo.
- VIII. Louisiana, Arkansas, Texas, Oklahoma, New Mexico—James H. Bond, Dallas, Tex.
- IX. Montana, Idaho, Wyoming, Utah, Colorado—Heber R. Harper, Denver, Colo.
- X. Washington, Oregon, California, Nevada, Arizona—Fay W. Hunter, San Francisco, Calif.

Each of these regional directors had previously served as a regional director in some unit of the Federal Security Agency. Dr. Coffey, the director of the new region III, is the only medical director of the former eight Public Health Service districts to become an FSA regional director.

AUSTRIAN PUBLIC HEALTH ASSOCIATION ORGANIZED

The Austrian Public Health Association, Vienna, has recently been established under the Presidency of Professor F. Reuter, Chief of the Public Health Office, Austrian Department of Social Welfare.

Principal among the purposes of the Association are improving the nutritional situation of the most vulnerable groups of the population, public health education, with special reference to foods, and focused on teachers, nurses, students, mothers, and housewives. Radio programs are also planned, together with health exhibits and motion pictures. Dr. Wilhelm Halden of Sanatorium Mariahilf, Klagenfurt, is the Secretary. The *American Journal of Public Health* for

the current year has been sent to the Austrian Public Health Association with the greetings of the American Public Health Association.

DR. JACKSON JOINS CANADIAN DEPARTMENT OF NATIONAL HEALTH AND WELFARE

Fred W. Jackson, M.D., D.P.H., of Winnipeg, Manitoba, who for the past 17 years has been Deputy Minister of Health and Public Welfare for the Province, has been appointed Director of Health Insurance Studies in the Department of National Health and Welfare, Ottawa. Dr. Jackson was one of the Canadian representatives at the fifth meeting of the Interim Commission of the World Health Organization, Geneva, and while overseas spent some time studying the United Kingdom's Health Insurance and Social Security plans. Since 1939 Dr. Jackson has been Professor of Preventive Medicine at the University of Manitoba, and for several years has been a lecturer at the School of Hygiene, University of Toronto.

The new provisions of federal grants-in-aid to the Canadian Provinces, according to the Prime Minister, represent a beginning of a complete health service for the Dominion of Canada. Dr. Jackson's work will be in the preparation of a health insurance plan for Canada.

ULSTER COUNTY (NEW YORK) PLANS TUMOR CLINIC

On September 10 the cornerstone of the Ulster County Tumor Clinic in Kingston was laid at ceremonies addressed by Dr. Morton L. Levin, Assistant State Commissioner of Health, Albany. The building is to cost \$300,000. This clinic, which has been designed for diagnosis, treatment, and research in cancer, is to be built with county funds set aside by the Ulster County Board of Supervisors for post-

war purposes. It is expected that the clinic will be opened in the summer of 1949.

In his address Dr. Levin said that a master plan for control of cancer is comprised of widespread public education, complete physician participation, tumor clinic facilities, detection center facilities, continued follow-up and after-care of cancer patients, and research.

DR. PARRAN RECEIVES DISTINGUISHED SERVICE MEDAL

On September 3, Kenneth C. Royall, Secretary of the Army, presented to Dr. Thomas Parran, former Surgeon General of the U. S. Public Health Service, the Distinguished Service Medal in recognition of Dr. Parran's aid and advice in developing the Army's war-time preventive medicine program.

DR. GARNIER APPOINTED LOUISIANA STATE HEALTH OFFICER

The appointment of W. V. Garnier, M.D., of Bastrop, as President of the Louisiana State Board of Health was announced on July 8. Dr. Garnier succeeds Waldo Treuting, M.D., M.P.H., who has joined the teaching staff of Tulane University School of Medicine, New Orleans, retaining a status as Consultant to the State Board of Health.

S. J. Phillips, M.D., M.P.H., has been appointed assistant to Dr. Garnier. Dr. Phillips, a native of Louisiana, has a degree in public health from the University of North Carolina.

PITTSBURGH'S NEW SCHOOL OF PUBLIC HEALTH

On September 22 it was announced that the University of Pittsburgh had received a grant of \$13,600,000 from the A. W. Mellon Educational and Charitable Trust for the establishment of a Graduate School of Public Health as a part of the university's Medical Center. Concurrently it was announced that the first Dean of the School would

be Dr. Thomas Parran, former Surgeon General of the U. S. Public Health Service for 12 years, and most recently Chairman of the U. S. Delegation to the First World Health Assembly in Geneva. Dr. Parran will also serve as consultant to Chancellor R. H. Fitzgerald of the university on the medical sciences.

In announcing the gift Paul Mellon, Trustee of the Mellon Trust, said, "The project is conceived as a nucleus from which, through extensive research and the association of others active in the field, there will evolve a great institute of preventive medicine for the betterment of health conditions of the people of Pittsburgh and similar urban industrial areas and also with benefits to the country at large and mankind in general. Careful studies of the Pittsburgh area convinced us that better health facilities are a vital need in the Pittsburgh area. Professional authorities told us that Pittsburgh's health needs can best be met through the training of professional leaders and the creation of facilities for research on urgent problems of public health."

Under the agreement with the university, the Mellon Trust has made available immediately an endowment of \$4,000,000 to enable the university to obtain outstanding men for the organization of the school and to assure adequate faculty and teaching facilities. An additional endowment of \$3,000,000 will be provided within 5 years when it appears that the school has developed into a successful undertaking. Five million dollars is allocated for the construction of school and laboratory buildings, and \$1,600,000 for developmental costs and operating and equipment costs during the first 5 years of operation.

The school will prepare students for the Master of Public Health and Doctor of Public Health degrees, both post-graduate to degrees in medicine, dentistry, sanitary engineering, nursing,

bacteriology, and allied sciences. There are 10 similar schools in the United States and Canada accredited by the American Public Health Association to grant these public health degrees. They are located at Harvard, Yale, Columbia, Johns Hopkins, Toronto, and Tulane Universities, the Universities of California, Michigan, Minnesota, and North Carolina. These grant public health graduate degrees to between 500 and 600 students annually, a number far short of that needed to man existing health services. Mr. Mellon said in announcing the gift, "This School will serve not only Pittsburgh and Pennsylvania, but its goal will be to attain world leadership in industrial and occupational health and in other fields of preventive medicine."

Dr. Parran has been full time in Pittsburgh since he returned from Mexico City early in October, where he attended a meeting of the Pan American Sanitary Bureau. He predicted that the new school would open its doors to students in 1950, since it would take that long for buildings to be constructed and a "key faculty" to be selected. The school's success, he said, will be measured by the quality rather than the number of students, and "quality" students depend on "quality" faculty.

PROGRESS IN PUBLIC HEALTH SPECIALTY BOARD

The first regular meeting of the members and Trustees of the American Board of Preventive Medicine and Public Health, Inc., was held in Chicago September 26 with the following persons present:

Floyd C. Beelman, M.D., Topeka, Kan.
 Walter L. Bierring, M.D., Des Moines, Iowa
 Richard F. Boyd, M.D., Washington, D. C.
 William P. Shepard, M.D., San Francisco, Calif.
 Ernest L. Stebbins, M.D., Baltimore, Md.
 Felix J. Underwood, M.D., Jackson, Miss.
 V. A. Van Volkenburgh, M.D., Albany, N. Y.

Eustace W. Tomlinson, New York—Attorney for the Board
 Gaylord W. Anderson, M.D., Minneapolis, Minn.
 Reginald M. Atwater, M.D., New York, N. Y.

It will be recalled that the Board was duly incorporated in July, 1948, under the laws of Delaware (*A.J.P.H.*, Sept., 1948, p. 1348). The By-Laws of the Board were adopted as approved by the incorporators after minor changes.

The following officers of the Board were elected to serve until the 1949 Annual Meeting of the Board:

Chairman: Walter L. Bierring, M.D.
Vice-Chairman: Felix J. Underwood, M.D.
Secretary-Treasurer: Ernest L. Stebbins, M.D.

The Board adopted the form of application for certification of physicians having special knowledge of preventive medicine and public health.

The Board discussed at length the accreditation of field training areas where residency experience could be obtained and counselled with Dr. Gaylord W. Anderson, *Chairman* of the Subcommittee on Field Training Areas, Committee on Professional Education, A.P.H.A.

Steps were taken to meet all the requirements of the Advisory Council on Medical Specialties for the recognition of the American Board of Preventive Medicine and Public Health as one of the official specialty boards.

The Board directed that it be made clear that the Board was not yet ready to receive applications from persons wishing to be accredited but that notice would be published in the *American Journal of Public Health* and other channels when that time comes.

It is expected that the Interim Board for Preventive Medicine and Public Health organized by the U. S. Army, Navy, and Public Health Service would be replaced by the American Board of Preventive Medicine and Public Health at an early date.

MEETING NEW PROBLEMS IN MILK SANITATION PROGRAMS

To meet the increasingly complex problem of milk control due to varied and often overlapping supervision by cities, increased milk production within the state and a demand for interstate shipment, and to the necessity for sanitation control of frozen desserts and other milk products plants, the Division of Health of Missouri has created a Milk Sanitary Advisory Council consisting of 9 members, 2 of them ex officio. Each, representing an official public health agency, is responsible for supervision of the milk sanitation program of his area. The Council will study current and special problems, and make recommendations to the Director of the Division of Health in an attempt to secure uniform application of procedures throughout the state. Council members are:

- I. H. Baird, D.V.M., Director of Milk Control, St. Joseph
- Raymond Bishop, Sanitary Inspector, Boonville
- Charles E. Carl, Public Health Engineer, State Division of Health
- W. J. Dixon, Director, Public Health Engineering, Kansas City Health Dept.
- M. R. Fisher, D.V.M., Director, Milk Control, St. Louis Division of Health
- L. W. Pickles, Director, Sanitation Section, St. Louis County Health Dept.
- Jack K. Smith, Public Health Engineer, Jackson County Health Dept.
- R. W. Hart, ex officio, U.S.P.H.S., Kansas City
- W. Scott Johnson, ex officio, Director of Environmental Sanitation, State Division of Health

BACTERICIDAL PROPERTIES OF CHLORAMINES AND FREE CHLORINE IN WATER

A review by C. T. Butterfield, *Public Health Reports*, of July 16, 1948, presents various experiments to determine the relative effectiveness of chloramines as compared with free chlorine. The following primary factors are cited as governing the bactericidal efficiency

of free chlorine and the chloramines:

1. The longer the time of contact of organism and bactericidal agent, the more effective sterilization.
2. The lower the temperature of the water in which the contact is made, the less effective the sterilization.
3. The higher the pH of the water in which contact is made, the less effective the sterilization. Thus, when a combination of high pH and low temperature is encountered, poorest results are to be anticipated.

DR. HEUSTIS MICHIGAN HEALTH COMMISSIONER

Albert E. Heustis, M.D., Director of the Branch County (Mich.) Health Department and earlier of the Monroe County Health Department, was recently appointed Health Commissioner of Michigan by Governor Kim Zigler. Since the resignation of William DeKleine, M.D., as Commissioner early in the year, Michigan has had two acting commissioners, first John K. Altland, M.D., Director of the Bureau of Local Health Services, and later George D. Cummings, M.D., Director of the Bureau of Laboratories. Each will continue in his regular post under the new commissioner.

Dr. Heustis who holds an M.P.H. degree from the Johns Hopkins School of Public Health is a non-resident lecturer in public health at the University of Michigan School of Public Health, a Trustee of the Michigan Hospital Association and Vice President and a member of the Board of Directors of the Southwestern Michigan Hospital Council.

THE ARTHRITIS AND RHEUMATISM FOUNDATION

Dr. W. Paul Holbrook, Tucson, Ariz., president, has announced the formation of this foundation to promote the study of arthritis and other rheumatic conditions with which it is estimated

7,500,000 persons in the United States are afflicted. The new foundation is sponsored by the American Rheumatism Association in coöperation with the National Arthritis Research Foundation, the Detroit Fund for Crippling Diseases, and others. The medical policies and activities are under the direction of a medical and scientific committee.

The main objectives include a nation-wide survey of what can be done to combat arthritis. It expects to: (1) develop, with the aid of the National Research Council, a research program designed to mobilize facilities of the nation's medical schools and of the basic sciences, in the search to discover the cause and methods for the prevention and cure of rheumatic diseases; (2) establish fellowships designed to increase the number of men qualified to conduct research and to specialize in the treatment of these diseases; (3) develop key centers throughout the country devoted to research, teaching, and treatment, coöordinated with medical schools; (4) promote a program of medical education to increase the appreciation of the profession as a whole of what can and should be done to bring effective treatment to patients with rheumatism; (5) foster the development throughout the nation of more adequate provision for patients with rheumatism, particularly in connection with the work of general hospitals.

Local chapters numbering 38 throughout the nation will help to integrate programs of investigation within their areas as well as raise funds for the purpose of financing such local programs and providing an equitable share of the funds needed to promote the national program of research as well as general educational and planning activities designed to support and increase the effectiveness of local efforts.

The chairman of the board of direc-

tors is Floyd B. Odium, Indio, Calif., president of the Atlas Corporation. Members of the Medical and Scientific Committee are:

Guy A. Caldwell, M.D., Professor of Clinical Orthopedics, School of Medicine, Tulane University of Louisiana

Russell L. Cecil, M.D., Professor of Clinical Medicine, Cornell University Medical College

Robley D. Evans, Professor of Physics, Massachusetts Institute of Technology

Morris Fishbein, M.D., Chicago, Editor, *Journal of the American Medical Association*

Philip S. Hench, M.D., Rochester, Minn., Professor of Medicine (Mayo Foundation), University of Minnesota Medical School

Andrew C. Ivy, Vice-President in charge of the Chicago Professional Colleges, University of Illinois

Karl F. Meyer, M.D., Director, the Hooper Foundation, University of California

Currier McEwen, M.D., Dean, New York University College of Medicine

Walter W. Palmer, M.D., Director, William Hallock Park Laboratories, Public Health Research Institute of the City of New York, Inc.

Howard A. Rusk, M.D., Professor of Rehabilitation, New York University College of Medicine.

COURSE IN LABORATORY DIAGNOSIS OF RABIES

A one week course in the Laboratory Diagnosis of Rabies, open to all grades of employed laboratory personnel, will be offered December 6 through December 10, 1948, at the laboratories of the U. S. Public Health Service's Communicable Disease Center in Atlanta, Ga.

Given primarily for laboratories of state and local public health departments and other official agencies responsible for the diagnosis of rabies, applicants from hospitals and private laboratories will be considered when vacancies occur. There is no tuition or laboratory fee, but travel and living expenses must be paid for by the individual or his employer.

Applications for the courses should be made as far in advance as possible

to Ernest S. Tierkel, Assistant Chief, Veterinary Public Health Division, Communicable Disease Center, 605 Volunteer Building, Atlanta 3, Ga.

NATIONAL HEART INSTITUTE ESTABLISHED

The National Heart Institute as a part of the National Institutes of Health, U. S. Public Health Service, was established in August in accordance with the National Heart Act of June, 1948. Its Director is C. J. Van Slyke, M.D., who was formerly director of the Research Grants and Fellowships Division of the National Institutes.

The first meeting of the National Advisory Council was held on September 8. Its membership of 12 appointive and 4 ex officio members is drawn from leaders in scientific research, medicine, education, and public affairs, and serves as the advisory body to the Public Health Service in administering the Heart Institute.

The members of the Advisory Council are:

James S. Adams, Lazard, Freres & Co., New York, N. Y.

Dr. C. A. Elvehjem, Dean, Graduate Schools, University of Wisconsin, Madison, Wis.

Maurice Goldblatt, Chicago, Ill.

Tinsley Harrison, M.D., Southwestern Medical College, Dallas, Tex.

T. Duckett Jones, M.D., Medical Director, Helen Hay Whitney Foundation, New York, N. Y.

Mrs. Albert D. Lasker, New York, N. Y.

Ernst Mahler, Kimberly-Clark Corporation, Neenah, Wis.

E. B. McNaughton, President, Oregonian Publishing Co., Portland, Ore.

Irvine H. Page, Director, Research Division, Cleveland Clinic Foundation, Cleveland, Ohio

B. O. Raulston, M.D., Dean, Medical School, University of Southern California, Los Angeles, Calif.

Paul D. White, M.D., Massachusetts General Hospital, Boston, Mass.

Albert J. Wolf, President, Board of Trustees, Touro Infirmary, New Orleans, La.

Colonel James S. Taylor (Army), Chief, Cardiovascular-Renal Section, Walter Reed General Hospital, Washington, D. C.

Leonard A. Scheele, M.D., Surgeon General, U. S. Public Health Service, Washington, D. C.

E. H. Cushing, M.D., Department of Medicine and Surgery, Veterans Administration, Washington, D. C.

Commdr. R. C. Parker, Jr., U. S. Naval Hospital, National Naval Medical Center, Bethesda, Md.

DIABETES DETECTION DRIVE

The American Diabetes Association, Inc., Brooklyn, N. Y., has announced the appointment of a Committee on Diabetes Detection with the aim to arouse interest among doctors generally and health agencies, in the problem of the earlier discovery and treatment of diabetes. Special programs have been planned in communities across the country during Diabetes Week, December 6-12, for the purpose of explaining this effort and initiating a continuing program. Charles H. Best, M.D., Toronto, is President and George E. Anderson, M.D., Brooklyn, Secretary of the Association. The Committee on Diabetes Detection is under the Chairmanship of Howard F. Root, M.D., Boston, Mass., and includes H. L. C. Wilkerson, M.D., of the staff of the U. S. Public Health Service, Boston.

PASTEURIZATION OF ALL MARKET MILK AND CREAM RECOMMENDED

In early June, 1948, a conference of interested officials, called by the U. S. Department of Agriculture, was held in Chicago to discuss methods for the control of brucellosis. Joel I. Connolly, M.S., Assistant to the President, Chicago Board of Health, represented the A.P.H.A. One of the recommendations made by the subcommittee on Laws, Regulations and Appropriations was "that state laws require the pasteurization of all market milk and cream." Among the other recommendations was one which called for a special brucellosis eradication program for each state, to be started not later than 1949. To effect a control program, it was

recommended that a state director for the program be appointed in each state, and that in each county a disease control board for the eradication of brucellosis should be organized.

AMERICAN SOCIAL HYGIENE ASSOCIATION IN NATIONAL DEFENSE PROGRAM

The Board of Directors of the American Social Hygiene Association on June 8, 1948, authorized the reestablishment of the Committee on National Defense Activities. The committee has received a special grant from the United Service Organizations to carry out its program. As a first step in the program the association has reestablished a Washington Office at 1424 K St., N.W., Washington, with Eleanor Shenehon, formerly Director of Public Information and Extension, in charge.

The Defense Activities Committee is made up of Philip R. Mather, Chairman, George Baehr, M.D., Mrs. Dwight S. Perrin, Major General Irving J. Phillipson, Rtd., William F. Snow, M.D., and Ray Lyman Wilbur, M.D.

The U. S. Interdepartmental Venereal Disease Control Committee, representing the Army, Navy, Air Force, Public Health Service, and other federal agencies, through its Chairman, Oscar F. Ewing, has asked A.S.H.A. for the following services:

To act as adviser to Central Armed Forces Disciplinary Control Board of the National Defense Establishments in matters pertaining to civilian community education and the repression of prostitution.

To continue and expand services to supply confidential data regarding prostitution conditions in the environs of military establishments.

To give consideration to performing the functions of the Federal Social Protection Division, which no longer exists.

To make available to the Armed Forces, on request, educational material and advisory services.

To bring citizen support to good law enforcement, social treatment, and individual health education through the home, the church, and the school.

DR. HELMHOLZ REPORTS ON BCG INOCULATIONS IN EUROPE

In September, Henry F. Helmholtz, M.D., chief pediatrician, Mayo Clinic, returned from Europe after serving a year as chief medical consultant for the United Nations International Children's Emergency Fund. He reported that tuberculosis in Europe is likely to be reduced drastically through the largest BCG mass immunization campaign ever undertaken, in which 15,000,000 children and adolescents were inoculated within a year and a half.

The BCG vaccine for Europe is prepared in the Serum Institute in Copenhagen and flown to other countries. The head of the Institute is Johannes Holm who has been in charge of the inoculation program since early summer. In September, two tuberculosis experts of the U. S. Public Health Service, Carrol Palmer, M.D., and Lydia Edwards, M.D., left for Copenhagen to begin work at the Institute on research involved in the program through which it is expected that approximately 50,000,000 children will be tested.

MODEL HEALTH CENTER FOR MEXICO CITY

The Institute of Inter-American Affairs has signed an agreement with the Ministry of Health in Mexico to construct a model health center in Mexico City, located in one of the poorest and most densely populated parts of the city. The health center will provide services for half of the district's population: clinics for venereal diseases, tuberculosis, acute communicable diseases, maternal and infant hygiene, mental and dental hygiene, a laboratory and facilities for health education, sanitary engineering and inspection, and a milk distribution center.

CALIFORNIA HAS DENTAL HEALTH BUREAU

A Bureau of Dental Health has been

established in the California State Department of Public Health, with Hugo M. Kulstad, D.D.S., as chief. The new unit will promote dental health education, give consultation service to local health departments and practising physicians, and conduct studies of dental disease incidence and preventive measures. Dr. Kulstad is chairman of the Council on Dental Health of the American Dental Association, past president of the Los Angeles Dental Society, director and past president of the American Society of Dentistry for Children, and a member of the executive council of the Southern California Dental Association.

DANISH HEALTH LAWS

Available in English translations are abstracts of a number of Danish public health laws. These are: The Combating of Venereal Diseases, Pregnancy Hygiene, Prevention of Morbidity and Mortality among children in the First Postnatal Year, School Medical Service, and Medical Examination of Children. Available from National Health Service, Copenhagen, Denmark.

Also available from the Danish Information Office, 15 Moore St., New York 4, are a series of pamphlets in English summarizing some of Denmark's social legislation. They are: Health Insurance and Hospitals in Denmark, Danish Maternity and Child Welfare, Care of the Aged in Denmark, and Danish People's Holidays.

DIRECTORY OF TUBERCULOSIS SANATORIUM BEDS

The National Tuberculosis Association has issued its 1948 *Tuberculosis Sanatorium Directory*, the first since 1942. It lists 830 institutions with 120,496 beds for patients with tuberculosis. Of the total, 17 institutions with 2,940 beds are in Alaska, Hawaii, and Puerto Rico. The number of beds has increased less than 2 per cent since

1942. The *Directory* is available from the National Tuberculosis Association, 1790 Broadway, New York 19.

WHO EXECUTIVE BOARD

The World Health Organization, permanently organized in Geneva at the first World Health Assembly June 24 to July 24 (*A.J.P.H.*, 38, 9:1347 (Sept.), 1948), was the ninth of the specialized agencies to be set up within the United Nations. Its Executive Board is made up of the representatives of 18 nations whose terms were assigned by lot. Future elections will be for a three year term. The countries and their representatives are shown below. Figures in parentheses indicate the length of their terms.

Australia: Dr. G. M. Redshaw (1)
 Brazil: Dr. G. H. dePaula Souza (2)
 Byelorussian S.S.R.: Dr. N. Evstaviev (3)
 Ceylon: Dr. S. F. Chellappah (1)
 China: Dr. W. W. Yung (2)
 Egypt: Sir Aly Tewfik Shousha, Pasha (2),
 Chairman
 France: Professor J. Parisot (2)
 India: Colonel C. Mani (3)
 Iran: Dr. M. H. Hafezi (1)
 Mexico: Dr. J. Zozaya (2)
 Netherlands: Dr. C. van den Berg (3)
 Norway: Dr. K. Evang (1)
 Poland: Dr. B. Kozusznik (3)
 Union of South Africa: Dr. A. J. van der
 Spuy (3)
 U.S.S.R.: Dr. N. A. Vinogradov (2)
 United Kingdom: Dr. M. Mackenzie (1)
 United States: Dr. H. Van Zile Hyde (1)
 Yugoslavia: Dr. Andrija Stampar (3)

INTERNATIONAL HOSPITAL ASSOCIATION PROPOSED

At the 50th annual meeting of the American Hospital Association in Atlantic City in September, Thomas Parran, M.D., former Surgeon General of the U. S. Public Health Service and dean of the new school of public health being organized at the University of Pittsburgh, proposed a strong international hospital association with regional branches in areas having common

interests, to work with a world health organization.

At this meeting Joseph G. Norby, Superintendent of Columbia Hospital, Milwaukee, was inducted as president of the Association succeeding Graham Davis, Director of the Division of Hospitals, W. K. Kellogg Foundation. John Hatfield, of the Pennsylvania Hospital, Philadelphia, was chosen president-elect.

MUTUAL LIFE OFFERS RADIO SCRIPTS ON HEALTH

An educational series of 15 minute radio scripts, dramatizing public health problems, was made available in September by The Mutual Life Insurance Company of New York. The scripts will be offered without charge on a monthly basis through May as an educational service to teachers, librarians, club leaders, and radio stations. Greta Baker, script writer and former member of the New York University faculty, is writing the series under the guidance of the company's medical department. In discussing the series, Miss Baker said: "The scripts can be used on or off the air. They are simply written, easy to produce, and make fascinating program material for club meetings, school assemblies, radio workshops, little theaters, and other community groups."

Free copies from the Public Relations Division, The Mutual Life Insurance Company of New York, 34 Nassau Street, New York 5.

MORE HELP FOR THE CEREBRAL PALSID

The National Association of American Business Clubs adopted cerebral palsy as a national project in 1947. At its annual meeting in 1948, it undertook to raise by the end of the year \$25,000 for production of an educational film on this disease. The funds raised will be turned over to the National Society for Crippled Children and

Adults which will make the film. It is designed as a popular movie to tell the story of the treatment and training required to rehabilitate cerebral palsied persons.

PUBLIC HEALTH IN INDIA

The August Bulletin of the Government of India Information Services (2111 Massachusetts Avenue, N.W., Washington 8, D. C.) is devoted to India's efforts for public health. This is a good source of information on health education, training programs, medical research, refugee camp sanitation, and many other health matters in India, including the goals of the Ministry of Health.

FURTHER STUDY OF CHILD FEEDING

The Department of Nutrition of the Harvard School of Public Health, whose Chairman is Fredrick J. Stare, M.D., has been conducting a three year experiment in the teaching of good eating habits to children in the Newton (Mass.) schools. Through a grant from Swift and Co., and an additional grant from the Nutrition Foundation, which sponsored the first study, the experiment will be continued for another three years and will be extended to include a typical school in the South. The Newton research project involves a study of the problem of fitting nutrition education into regular school study courses, measuring the effectiveness of such education as a logical beginning for other health education and preparing teaching aids on nutrition.

75 YEARS OF AMERICAN NURSING

The Diamond Jubilee of Nursing in the United States is being celebrated by the American Nurses' Association in 1948. The purpose of the Jubilee is "to focus public attention on the extension and improvement of nursing service to all through the improvement of schools of nursing, economic security

for all nurses, adequate licensure laws, and more effective counselling and placement of both prospective students and graduate nurses" according to Pearl McIver, A.N.A. President.

As a feature of the celebration, November 14 to 20 is designated Nursing Progress Week. A Linda Richards Banquet will be held in New York on November 16 to memorialize the first professional nurse in the United States, graduated from the New England Hospital for Women and Children in 1873. The September, 1948, *American Journal of Nursing* contains a summary of Miss Richards's life and her contributions to the nursing profession in which she was an active practitioner until 1911 at the age of 70.

FORTIFYING ALASKA'S PUBLIC HEALTH

The U. S. Department of the Interior and the Federal Security Agency have awarded contracts for a 400 bed, \$6,000,000 hospital at Anchorage, Alaska. Of the total, 300 beds will be reserved for tuberculosis, 100 for general medical or surgical cases.

In addition, the U. S. Public Health Service has established a field station in Anchorage as the nucleus of an Arctic Institute of Health, as recommended by American Medical Association—Department of the Interior survey of a year ago. Jack C. Haldeman, M.D., formerly Medical Consultant, U.S.P.H.S. in New Orleans, is in charge of the field station which began operation on October 1.

TUBERCULOSIS DIVISION IN MONTREAL HEALTH DEPARTMENT

The Montreal Health Department has created an independent division of tuberculosis from what has been, since 1938, a tuberculosis section of the communicable diseases division. The new division was created "because of the proportions taken by the fight against tuberculosis in the 10 years since 1937;

the magnitude of the problem in the city, and the increase in the budget attributed to this branch of the work."

In 1937, when the tuberculosis section was developed, the tuberculosis death rate in Montreal was 82.2; in 1938 it was 74.8; in 1947 it had dropped 25 per cent to 56.4, and in the first six months of 1948, to 55.4.

THREE CHEMISTRY AWARDS

Dr. Dilworth Wayne Woolley, 34, of the Rockefeller Institute for Medical Research, New York, at the meeting of the American Chemical Society on August 30, in Washington, D. C., received the \$1,000 Eli Lilly & Co. prize in biological chemistry for his studies of problems relating to vitamins and anti-vitamins.

Another \$1,000 award—the Paul-Lewis Laboratories award in enzyme chemistry—went to Dr. Albert L. Lehninger, 31, Assistant Professor of Biochemistry in the University of Chicago departments of surgery and biochemistry and metabolism of fatty acids.

Dr. Gerty T. Cori of the Washington University School of Medicine, St. Louis, a 1947 Nobel Prize winner, for her work in biochemistry, received the Francis P. Garvan Medal honoring women in chemistry.

CANCER NURSING IN-SERVICE PROGRAM

A two week In-service Program for public health nurses on the clinical aspects of cancer was held in September at the Western Reserve University School of Nursing under the sponsorship of the Ohio State Health Department and with the coöperation of the University's School of Medicine, University Hospitals of Cleveland, and the Ohio Division of the American Cancer Society. Thirty-five nurse directors and supervisors of the Ohio Department of Health attended the institute.

TWO CALIFORNIA COUNTIES JOIN FORCES

Humboldt and Del Norte Counties in California have joined forces to form the second bi-county health department now operating in the state. The combined population of the two counties in 1946 was about 55,000. Boards of supervisors of the two counties agreed to a contract extending the services of the established Humboldt County Health Department over the entire area. Kenneth Haworth, M.D., is Health Officer.

MORE ABOUT "SCHOLARS IN MEDICAL SCIENCE"

In preparation for the selection of a second group of candidates in the Markle Foundation's program of grants for "Scholars in Medical Science" (see *Journal*, May, 1948, p. 755), the Foundation has published a booklet that describes the purposes of the grants to guide medical schools in making nominations for the coming year. It also lists the 16 scholars who are currently studying under the grants.

In this program, which the Foundation has substituted for its former medical research grants, only schools of medicine are permitted to nominate candidates. Nominations should be made by December 1, 1948, for the academic year 1949-1950. The booklet is available from The John and Mary R. Markle Foundation, 14 Wall Street, New York 5.

SEMINARS FOR MARYLAND HEALTH OFFICERS

A series of quarterly seminars in local health administration are being conducted by Ernest L. Stebbins, M.D., director of The Johns Hopkins School of Hygiene and Public Health, and Allen W. Freeman, M.D., consultant in public health administration to the State Board of Health, to provide regular opportunity for county health

officers in Maryland to discuss their problems. The seminars will be held in four districts into which the counties have been grouped. The program for each session will be formulated by a health officer designated in advance of the meeting, who will prepare an outline of the problems to be discussed.

BABE RUTH FOUNDATION

The Babe Ruth Foundation has been organized to develop a program to help the "kids of America." Among its activities is the Babe Ruth Cancer Fund which received an initial gift of \$100,000 from the Revere Camera Company of Chicago in September. The Cancer Fund will be administered by the American Cancer Society, with special emphasis on the problem of cancer among children.

The Babe Ruth Foundation will also aid in promoting the recreation and leisure time interests of children, and assist work aimed at the control and prevention of delinquency. Director of the Foundation is Shelby Harrison who retired as General Director of the Russell Sage Foundation about a year ago. Headquarters are in the Russell Sage Building, 122 East 22nd Street, New York.

VERMONT CANCER SOCIETY FORMED

The Vermont Cancer Society, Inc., was organized last spring as a division of the American Cancer Society, under the sponsorship of the Vermont State Medical Society, with Dr. Benjamin F. Cook, Rutland, as President and John W. Brownlee, Rutland, Secretary.

SCIENCE WRITING AWARDS

The George Westinghouse Science Writing Awards of \$1,000 each were presented by the American Association for the Advancement of Science at its recent annual meeting to Frank Carey, science reporter in the Washington Bureau of the Associated Press, for the

best newspaper science writing for a four part series on "Newest Wonder Drug Conquers Dread Scrub Typhus," distributed by the Associated Press; and to Florence Moog, Ph.D., Assistant Professor of Zoölogy at Washington University, St. Louis, for the best magazine science writing for an article on "The Biology of Old Age," which appeared in the June issue of *Scientific American*.

BOSTON IS BEING SURVEYED

Two preliminary reports have been published concerning the Greater Boston Survey of Social and Health Needs and Services, which has been in progress since 1947. Called "the most inclusive (study) ever made in Greater Boston of total income and total expenditures for all social and health agencies," the study grew out of skyrocketing agency operating costs and deficits. Its purpose "is to make sure that the charitable dollar annually raised in Greater Boston does the greatest good for the greatest number in the most economical, effective way."

The two preliminary reports available thus far are reprinted respectively from the January, 1948, *Boston Business*, monthly publication of the Boston Chamber of Commerce, and June-July, 1948, *Bulletin of the Greater Boston Community Council*.

Director of the Survey is Robert P. Lane who was for 12 years director of the Welfare Council of New York. The five divisions of the Survey and their directors are: *Public Health*—Ira V. Hiscock, Sc.D., Chairman, Department of Public Health, Yale University, and Hugh Leavell, M.D., Dr.P.H., Professor of Public Health Practice, Harvard University School of Public Health; *Hospitals*—Basil C. MacLean, M.D., Director, Strong Memorial Hospital; The University of Rochester, and Albert W. Snoke, M.D., Director, Grace-New Haven Community Hospital,

Group Work and Recreation—Lewis R. Barrett, Recreation Consultant, New York City; *Voluntary Casework*—Frederick I. Daniels, Executive Director, Brooklyn Bureau of Social Service, and Frank T. Greving, Executive Director, New York City Veterans Service Center; *Public Welfare and Statistics*—R. Clyde White, Ph.D., Professor of Public Welfare, School of Applied Social Sciences, Western Reserve University, and Genevieve C. Weeks, Director, Research Bureau, Greater Boston Community Council.

In addition, a division of planning and finance will be set up later, the work to be done by a panel of three members—a business man with experience in fund work and budgeting, a Fund Executive, and a Council Executive. The Chairman of this panel is Herman D. Smith of the Chicago office of Marsh and McKennan, Inc., and former President and now Vice President of the Chicago Community Council.

NEW HEALTH LAWS IN JAPAN

The Japanese Diet in July passed two health reforms, the Venereal Disease Prevention Law and the Preventive Vaccination Law. The first provides that all pregnant women are to have a health examination to determine the presence or absence of venereal disease; and all persons entering into marriage are to obtain certificates showing that they are free from venereal disease. Compulsory examination may now be performed on persons in whom there is reasonable evidence to suspect venereal disease, but if they claim there is not reasonable evidence they may appeal to a court for withdrawal of the order for a venereal disease examination. The law further requires that doctors give instruction to patients with venereal disease on how to protect others from their diseases and also as to treatment to be followed. Doctors must report to

health authorities the names and addresses of contacts and of those patients who fail to follow instructions pertaining to treatment and preventive measures. The law requires that all such information be kept confidential.

Until the Preventive Vaccination law was passed, compulsory vaccination was required only for smallpox; it is now required also for typhoid, paratyphoid, whooping cough, tuberculosis and diphtheria.

OHIO HAS BRUCELLOSIS CAMPAIGN

A campaign has been undertaken in Ohio jointly between the Ohio State Medical Association, the State Veterinary Medical Association, and the Department of Agriculture to attack the problem of brucellosis in Ohio. The State Medical Association has produced a pamphlet entitled "Mr. Farmer, Protect Your Family from the Advancing Menace." Similar folders were prepared by the State Veterinary Medical Association and the Department of Agriculture. An active radio publicity program was developed with broadcasts over four stations and an exhibit was set up at the State Fair as well as at other farm events. Joint committees coöperated with farm organizations, home demonstration leaders, 4-H Clubs, rural physicians and veterinarians, future farmers, and county health officials.

PERSONALS

WILLIAM H. ADOLPH, who has been serving as Professor of Biochemistry and Acting President of Yenching University in Peiping, China, has been appointed Professor of Biochemistry at the Peiping Union Medical College.

H. V. BARRETT, M.D.,† has resigned as Director of the Montgomery County

(Kansas) Health Department to become Assistant Health Officer and Epidemiologist with the Topeka City-Shawnee County Health Department.

REAR ADMIRAL THOMAS CARLYLE ANDERSON, M.C., U.S.N., is on indefinite loan from the Navy to be in charge of a unit dealing with medical and related man power in the Medical Division of the National Security Resources Board.

ALASKA

ARNE BULKELEY, LILY HAGERMAN,* and MARIAN OYSTER, have been added to the nursing staff of the Alaska Department of Health, to serve respectively in the Wrangell office, as Nursing Educational Director in Juneau, and in Anchorage. Miss Bulkeley was most recently a county public health nurse in Georgia and has Army Nurse Corps and New York City Visiting Nurse Service experience. Miss Hagerman has been for 5 years Nursing Consultant and Nurse Consultant in Mental Hygiene with the U. S. Public Health Service and for 5 years previously Director of Public Health Nursing in the Utah State Health Department. Miss Oyster has just received her B.S. degree from Western Reserve University with a Major in public health nursing.

GEORGE F. CAMPANA, M.D.,* formerly State Health Officer of North Dakota and more recently in charge of communicable disease control work of the New Hampshire State Department of Health, has been appointed Worcester district health officer for the State Department of Health, Mass. He succeeds PAUL RICHMOND, M.D.,† who resigned to head the student health service at Tufts College, Medford, Mass.

LEWIS CLARK, D.D.S., has resigned as Dental Health Director, Florida State Board of Health, to enter private practice in Winter Haven, Fla.

* Fellow A.P.H.A.

† Member A.P.H.A.

ANGIE CONNOR, M.D., is the new Clinical Pediatrician in the Bureau of Maternal and Child Health and Crippled Children, Hawaii Health Department. Dr. Connor served with the U. S. Army for over 2 years and was recently associated with the Children's Heart Association in Cincinnati, Ohio.

CLARA E. COUNCELL, Ph.D.,* has been named head of a new unit in the Children's Bureau, Washington, D. C., which will be a clearinghouse for information on medical and other types of research in the field of child health and welfare.

JAMES M. CUNNINGHAM, M.D.,† Director of the Connecticut State Health Department's Bureau of Mental Hygiene since 1935, on August 1 became Director of the Detroit Children's center, recently created by a merger of the Wayne County Child Guidance Clinic and the Children's Center of the Children's Fund of Michigan. It is to render clinical service and serve as a training and research center for psychiatric social work students interested in clinical psychology and for fellows in child psychiatry.

WARREN F. DRAPER, M.D.,* formerly Deputy Surgeon General, U. S. Public Health Service, and most recently on the staff of the American National Red Cross, Washington, has been appointed executive officer of the Medical and Hospitalization Service of the Welfare and Retirement Fund, United Mine Workers of America, 907 15th Street, N. W., Washington 5, D. C.

BION, R. EAST, D.D.S.,* who has been Professor of Dentistry at Columbia University, New York, has been appointed Chief of the Veterans Administration Dental Services effective August 4.

FRED T. FOARD, M.D.,* who has served as Director of the U. S. Public Health Service District 6 in Puerto Rico and the Virgin Islands, has been appointed Director of Health of the Bureau of Indian Affairs, Washington, D. C., effective in September.

RUTH FREEMAN, R.N.,* has been granted a 3 months' leave of absence from her work as Administrator of Nursing Services, American National Red Cross, to head the nursing section of the medical Branch, National Security Resources Board.

JOHN T. FULTON, D.D.S.,* was appointed as the new president of the American Association of Public Health Dentists. He is dental adviser of the Children's Bureau, Federal Security Agency, Washington, D. C.

EDMUND C. GARTHE,* has been appointed to head the Land and Air Carrier Section of the Sanitary Engineering Division of the Public Health Service, Washington, D. C., succeeding H. NORMAN OLD,† who has been assigned to the Bureau of Medical Services. Mr. Garthe has been with the Public Health Service since 1936, beginning as Junior Sanitary Engineer. In 1944 he became District Engineer in the New York District and in 1945 District Engineer of the Chicago District.

E. T. GERTSON, M.D., Atwood, Kan., has been appointed Health Officer of Rawlins County, succeeding JOHN C. CONROY, M.D., also of Atwood.

ALEXANDER G. GILLIAM, M.D.,* has been appointed head of the Epidemiology Section of the Cancer Control Branch, National Cancer Institute, Washington, D. C. Joining the Public Health Service in July, 1934, Dr. Gilliam has devoted his full-time services to epidemiological work in the United States and abroad. For 8 years he worked at the National Institute of Health on epidemiology of

* Fellow A.P.H.A.

† Member A.P.H.A.

poliomyelitis, diphtheria, mumps, and other infectious diseases. As the first epidemiologist of American Typhus Commission, he conducted typhus fever surveys among U. S. troops in Egypt, Tripoli, India, China, and Burma, for which he was awarded the Typhus Commission medal. For the last 2 years, Dr. Gilliam has conducted field investigations, laboratory and statistical studies on poliomyelitis, at the University of Michigan School of Public Health, teaching also in the University Department of Epidemiology.

O. R. GREGG, M.D.,† was transferred from his position as Director of Choctaw-McCurtain Counties Health Department in Oklahoma to the same position in Cleveland County.

FLORIDA

JAMES B. HALL, M.D., former Director, Cancer Control Division, Florida State Board of Health, is studying for his master's degree in public health at the University of California; ELIZABETH REED,† Acting Director, Health Information, for a bachelor of science degree in supervision in public health nursing at Teachers College, Columbia University, New York City; JOSEPH M. BOSTOWISH, JR., M.D., Alachua County Health Department, for his master's degree in public health at Johns Hopkins; JOHN WAKEFIELD,† sanitary engineer is doing graduate work in sanitary engineering at Harvard University; ANGELINE WARD, nurse, Escambia County Health Department is studying public health administration at the University of North Carolina; IRENE FITZGERALD, nurse, Manatee County Health Department, is studying public health nursing at the University of Colorado.

REBA F. HARRIS,* has accepted the position of Chief of the Public Health Education Unit, Ohio Department of Health, Columbus, effective August 1.

R. H. HAZEMANN, M.D., M.P.H.,† Director of the Department of Health of the Seine and Oise, Versailles, France, has been elected Officer of the Legion of Honor.

HAROLD R. HENNESSY, M.D.,* who has been associated with the American Medical Association's Council on Industrial Health since February, 1946, has been appointed to the newly-created office of Secretary of the Council on National Emergency Medical Service of the Association. JAMES C. SARGENT, M.D., Milwaukee, Wis., is chairman of the council, which was formed in 1947 to coördinate medical efforts associated with a national emergency. Dr. Hennessey, who received his M.D. degree from the University of Minnesota, held various assignments during the war years, his last being that of head of the Public Health Section in the Office of the Surgeon, Fifteenth U. S. Army. He received several military decorations, including the Order of Orange-Nassau Degree of Officer with Swords from the Netherlands government.

A. PARKER HITCHENS, M.D.,* who retired in May as Health Officer of Wilmington, Del., has been appointed Director of the Bureau of Laboratories of the Pennsylvania State Department of Health, Philadelphia succeeding CLAUDE BROWN, M.D.,* retired.

M. C. IGLOE, M.D., M.P.H.,† who has been serving with the Veterans Administration in Chicago, has resigned to accept the position of Chief District Health Officer with the Chicago Department of Health. He will be in charge of the First District Health Center, Chicago, including a population of about 175,000, which will be used as a teaching center for the students of the medical college of the University of Illinois.

HOLLIS S. INGRAHAM, M.D.,* Director of the Bureau of Communicable Dis-

ease Control, has been appointed as a Deputy Commissioner of the New York State Department of Health, effective August 1.

WILSON W. KNOWLTON, M.D.,† has been appointed Superintendent of Westfield State Sanatorium at Westfield, Mass., the cancer-tuberculosis hospital operated by the State Department of Health. He was formerly Assistant Director of the State Division of Tuberculosis, and succeeds DONALD A. MARTIN, M.D., who resigned to accept the superintendency of the Plymouth County Sanatorium at South Hanson.

ROBERT F. KORNS, M.D.,* has been promoted from Assistant Director, a position he has held since 1945, to Director of the Bureau of Communicable Disease Control of the New York State Department of Health, Albany. In the department since 1939, he has served both as assistant district state health officer and as epidemiologist in the Division of Communicable Diseases.

GEORGE KRAUS, M.D.,† was appointed the first full-time Health Officer for the Town of Fairfield, Conn., effective July 1, 1948, thus increasing the number of full-time local health officer positions in Connecticut. In the Army Medical Corps from 1946 to 1948, Dr. Kraus's duties were largely public health in character. He plans to enter Yale University, Department of Public Health, as a candidate for a graduate degree in public health.

VINCENT B. LAMOUREUX† is in charge of the sanitary engineering aspects of national security, having been loaned by the Public Health Service to the Medical Division, National Security Resources Board.

H. WALLACE LANE, M.D., has been appointed Director and Health Officer of the Butler County (Kansas) Health Department.

EDWARD C. LOVE, JR., M.D., has been

appointed Health Officer of the Gadsden, Liberty, and Calhoun Counties Health Department with headquarters at Quincy, Fla.

RICHARD P. McKNIGHT, M.D., has been appointed Director of the new Division of Hospitals in the Massachusetts State Department of Health. Since 1942 he has headed the Bureau of Hospital Inspection in the department.

BERTRAM E. MARKS, M.D.,† was appointed Health Officer of Middletown, Conn., effective July 1, 1948. After 5 years of service, Dr. Marks retired from the Army Medical Corps in 1946, with the rank of lieutenant-colonel. He then did graduate study in hospital and health administration at Bellevue Hospital and in public health at Columbia University.

ALBERT S. McCOWN, M.D., Dr.P.H.* has been named Director of the Bureau of Communicable Disease Control, Virginia State Health Department, to succeed W. A. BROWNE, M.D.,* resigned.

PEARL McIVER,* President of the American Nurses' Association and Chief of the Office of Public Health Nursing, U. S. Public Health Service, attended a biennial meeting in London of the Board of Directors of the International Council of Nurses, September 16 to 21, serving as official United States delegate, representing 166,000 registered professional nurses in the American Nurses' Association. Miss McIVER was joined in London by KATHARINE J. DENSFORD, Director of the University of Minnesota School of Nursing and second vice president of the International Council, and ELLA BEST, executive Secretary of the ANA, who served as an official observer at the International Council sessions.

JULIE E. MIALE, R.N., has resigned

* Fellow A.P.H.A.

† Member A.P.H.A.

after 3 years as Associate, Program Development Service, National Tuberculosis Association. She is the author of the NTA pamphlet, *Tuberculosis—Industrial Nursing and Mass Radiography*, published in 1946. FRANCES W. GREENE,† Associate, Health Education Service, National Tuberculosis Association, has resigned to join the Texas Tuberculosis Association.

CHARLES O. PARKER, JR., M.D., has been appointed Health Officer of Lake County (Florida) Health Department with headquarters at Tavares, Fla. He succeeds R. J. DALTON, M.D.,† resigned.

RUTH PARMELEE, M.D., M.P.H.,* after 5 years' work during the war in the Near East and Greece in medical relief, has returned to Greece as Health Adviser for Pierce College, Elliniko (Glyphada), Greece.

W. W. PETER, M.D., DR.P.H.,* formerly Chief, Training Section, Health and Sanitation Division, Institute of Inter-American Affairs, Washington, D. C., has been named Chief, Medical Section, succeeding CLARK H. YEAGER, M.D., DR.P.H.,* following a merging of the two sections into one.

JOHN J. POUTAS, M.D.,* Assistant Medical Director and Chief of Professional Services in the New England office of the Veterans Administration, was recently appointed as Medical Director of Lever Brothers Company, Cambridge, Mass. Dr. Poutas will direct the health and medical services, including clinics in all plants, for the 6,000 employees of the company.

BERYL J. ROBERTS,† has resigned as Director of Health Education of the Massachusetts Tuberculosis League, Inc. She has accepted a part-time post as Associate in Health Education in the Department of Public Health Practice, Harvard School of Public Health, and will head the health education work of the Massachusetts

division of the American Cancer Society.

LOUIS SCHWARTZ, M.D.,* formerly Chief, Section of Dermatology, U. S. Public Health Service, has opened an office for private practice in Occupational and Other Contact Dermatoses in Washington, D. C.

RICHARD E. SHOPE, M.D., currently on the staff of the Rockefeller Institute for Medical Research, in the spring of 1949 will become Associate Director of the Merck Institute for Therapeutic Research, Rahway, N. J. At that time a new building will have been completed providing facilities for Dr. Shope to study animal pathology.

GUSTAV I. STEFFEN, PH.D.,† has been named as Director of the Bureau of Laboratories, New York City Department of Health to succeed RALPH MUCKENFUSS, M.D.,* appointed First Deputy Commissioner. Dr. Steffen has been Assistant Director of the Bureau since 1940.

DONALD E. UPP, M.D., is the newly appointed Health Officer of Cowley County, Kansas. He is replacing THOMAS R. HOOD, M.D.,† who has been granted educational leave to study for his master's degree in public health at Harvard University.

GRAHAM WALTON, PH.D.,† has been transferred from the Bureau of Prisons, U. S. Department of Justice, Washington, D. C., to the Water & Sanitation Investigations of the U. S. Public Health Service, where his headquarters will be in Cincinnati, Ohio.

ADOLPH WEINZIRL, M.D.,* Professor and Head of the Department of Public Health and Preventive Medicine at the University of Oregon Medical School, Portland, has retired as Director of the E. C. Brown Trust, Portland, which was concerned with social hygiene, assuming the position as consultant. He has been succeeded by CURTIS AVERY who assumed his new duties September 1.

ALBERTA B. WILSON, R.N.,* has resigned as Assistant Director, National Organization for Public Health Nursing, New York City, to become Assistant Professor of Nursing, University of Minnesota School of Public Health, Minneapolis.

YAN TIM WONG, M.D., has been appointed Assistant Chief and Child Psychiatrist with the Hawaii Department of Health.

LEWIS A. YOUNG* has been appointed Director of the Division of Sanitation, Colorado Department of Public Health. For the past 6 years Mr. Young has been Chief Engineer and Associate Chief of the Colombian Field Party, Division of Health and Sanitation, Institute of Inter-American Affairs.

Deaths

FRANCIS PARKMAN DENNY, M.D.,* retired physician and Brookline, Massachusetts Health Officer for more than 40 years, died September 6 at the age of 79. Dr. Denny was a Charter Fellow and a 40 year member of the A.P.H.A. (Health Officers Section).

ANDREW G. DUMEZ, PH.D.,† Dean of the School of Pharmacy, University of Maryland, and Secretary of the American Council on Pharmaceutical Education, died suddenly on September 27 at the age of 64 (Unaffiliated).

PHILIP K. GILMAN, M.D., Clinical Professor Emeritus of Surgery at Stanford University Medical School, and chief of the Bureau of Hospitals of the State Department of Public Health, died at his home in San Anselmo, Calif., on September 7 at the age of 69.

THOMAS J. LEBLANC,† Head of the Department of Preventive Medicine at the University of Cincinnati, died September 9 after an illness of several

months, at the age of 54. Dr. LeBlanc was formerly a research fellow with the Rockefeller Institute and a special staff member of the Rockefeller Foundation. He also had been statistician with the U. S. Public Health Service in Washington (Unaffiliated).

DWIGHT MILTON LEWIS, M.D.,* Director of Communicable Diseases in the New Haven, Conn., City Health Department, until his retirement 2 years ago, died on August 31 in New Haven Hospital at the age of 73 (Health Officers Section).

JAMES ALEXANDER MILLER, M.D., one of the founders of the National Tuberculosis Association and NTA president 1921-1922, died on July 29, after a brief illness.

BERTHOLD S. POLLAK, M.D.,† Medical Director of the Berthold S. Pollak Hospital for Chest Diseases at Jersey City, died June 27 after a brief illness. He was 75 years old (Unaffiliated).

THOMAS T. SHEPPARD, M.D.,† Chief, Medical Staff, Western Pennsylvania Hospital, Pittsburgh. Elected Member 1946 (Vital Statistics Section).

B. H. VOLLERTSEN, M.D.,† Medical Department, E. I. du Pont de Nemours & Co., Penns Grove, N. J. Elected Member 1937 (Industrial Hygiene Section).

JOHN HAMILTON WATKINS, PH.D.,* Associate Professor of Public Health at Yale University, died suddenly on September 24 at the age of 47. Professor Watkins, an expert in the field of vital statistics and a Lieutenant Colonel in World War II, was an instructor in Bacteriology at Iowa from 1925 to 1927, and was employed by the sanitary district of Chicago from 1927 to 1928. He went to Yale as an assistant in public health in 1928 and received his Ph.D. degree in 1931. In 1936 he was made an assistant professor and in 1941 an associate professor (Vital Statistics Section).

A Centennial of Public Health*

LOUIS I. DUBLIN, PH.D., F.A.P.H.A.

Second Vice-President and Statistician

Metropolitan Life Insurance Company, New York, N. Y.

THE year 1948 marks the centennial of the movement for effective public sanitation and organized health protection. Just a hundred years ago, thanks to the perseverance of a small group of public spirited men, the first Public Health Act became law and the first General Board of Health was established in London. From these beginnings have come the extraordinary developments of sanitary and hygienic services which have made life for all much safer and happier. The past century may properly be called the era of public health and medical advancement, with what this implies for the general welfare.

Prior to the passage of these laws, there had been no central authority responsible for the sanitation of London or of other large cities. As a consequence, the state of public health in these places had become a disgrace to the English people. Travelers' accounts of their observations in cities on the continent disclose conditions not much better. It is difficult for our generation to conceive how so many survived this period of filth, squalor, and disease.

This was the time of the industrial revolution, when hordes of men, women, and children flocked to the cities seeking employment in the new factories. The cities, utterly unprepared to meet the influx, had no means of housing the newcomers except in areas where living conditions were already wretched. To make matters worse, flimsy tenements without proper provision for ventilation, light, water and waste disposal were improvised. Streets were dark, narrow, and barely passable owing to filth, stagnant pools, and the stench. Inevitably, the drinking water became contaminated and as a result, typhoid fever, dysentery, and cholera took a large toll of lives. The factories were equally abominable. Lack of sanitation, long working hours, and starvation wages completed the lot of the poor. Disease and disability were the order of the day.

The situation in American towns was hardly better. They were even less prepared than were the older British cities to accommodate the masses of poor immigrants that swarmed to our shores from the famine and poverty stricken areas of Europe. There followed a mushroom growth with no forethought or plan for the future. The pestilent state of American cities closely resembled

* Presented before the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

that abroad. They suffered from periodic visitations of smallpox, typhus, typhoid fever, cholera, and yellow fever. A classic description of sanitary conditions in New York City has come down to us from the pen of the great Stephen Smith, the first President of the American Public Health Association.

New York was in the grip of the deadly typhus. "I noticed," he writes, "that patients were continually admitted from a single building in East Twenty-second Street. . . . I visited the tenement and was not surprised at the large number of cases of fever which it furnished our hospital. The building was in an extreme state of dilapidation generally; the doors and windows were broken; the cellar was partly filled with filthy sewage; the floors were littered with decomposing straw, which the occupants used for bedding; every available place, from cellar to garret, was crowded with immigrants—men, women and children. The whole establishment was reeking with filth, and the atmosphere was heavy with the sickening odor of the deadly typhus, which reigned supreme in every room."

Similar conditions existed in most other rapidly growing towns to which immigrants flocked. One would think that the municipal authorities would have welcomed any proposal which promised relief from a situation that threatened the very existence of the cities. But constant familiarity with these conditions seems to have produced the proverbial contempt; for it is a matter of record that few reform movements have met with more violent opposition than those directed at the improvement of the public health.

It was in England that the greatest concern was shown. Social reform was in full swing. In the health field, the leader of the British movement was Edwin Chadwick, a man endowed with inexhaustible energy and the zeal of

the crusader. Having made noteworthy contributions to social welfare by overhauling the archaic Poor Law and exposing the shocking conditions in factories, he later concentrated on the problem of the public health. His efforts led in 1843 to the appointment of a new Royal Commission for the Study of Health in Towns and Populous Places, the findings of which were so conclusive that Parliament could no longer ignore the evidence. In 1848, the first Public Health Act was passed. By this Act, a General Board of Health was created composed of three members of whom Chadwick was the vital force and driving power. Here was the beginning of the modern movement for the protection of the public health. Chadwick thus helped to establish an effective instrument through which the increasing knowledge of environmental sanitation and the natural history of disease, coupled with the spirit of social betterment, could be put to work in the public interest.

Unfortunately, Chadwick was a born bureaucrat. In his zeal to put his plans into operation as speedily as possible, he was often impatient of slow democratic processes. His arbitrary ways and intolerance of opposition consolidated a powerful reaction and so irritated Parliament that the Board was abolished after seven hectic years of controversy and confusion. Chadwick was forced out of public life.

His work, however, was ably carried on by a man no less effective but more diplomatic in achieving his ends. John Simon, who was appointed Medical Officer of the Crown in 1855 following the dissolution of the General Board of Health, led and largely determined the course of public health reform between 1855 and 1876, when he retired. In his annual reports and other writings, he laid down principles that have been the foundation of nearly all subsequent work in public health. In the educa-

tional phase of his work, Simon owed much to the coöperation of William Farr of the General Register Office, whose reports are classic examples of how the dry facts of vital statistics can be utilized to advance human health and welfare. Although Farr was a pioneer in this field, his numerous interpretive studies of statistical data have seldom been surpassed either for their scope and originality or for their practical applicability to the solution of public health problems.

It would have been very strange indeed if all this activity across the seas had failed to rouse the interest of at least a few kindred spirits in America. The first to respond to the new viewpoint on the communal responsibility for disease control was Lemuel Shattuck of Boston. In the course of a laborious study on the "Vital Statistics of Boston," completed in 1841, he discovered the gross deficiencies of the registration system and the urgent need for reforms. Accordingly in the following year, he was the prime mover in the passage of the first law regulating the registration of births, deaths, and marriages throughout the State of Massachusetts. This law was closely patterned after the British Births and Deaths Registration Act of 1836 and, in turn, became the model for most laws of this nature to be enacted by the various states.

In 1849, the year after the establishment of the General Board of Health in England, Shattuck was appointed a member of a commission to conduct a "Sanitary Survey of the State of Massachusetts." Shattuck resembled Chadwick in his boundless energy, his insight into the essential elements of a problem, and in his influence with his fellow commissioners. The report that followed in 1850 was chiefly the product of his mind. This remarkable document, a classic of its kind, outlined the essentials for an effective State Board of Health.

Unfortunately, the plan was too far-reaching and too revolutionary for its time. When in 1853 the Legislature was petitioned to establish a State Health Department based on the findings of the survey, it refused to act. It was difficult to convince the average legislator of that day of his power to regulate conditions affecting the public health. Massachusetts had to wait until 1869 before it had a State Health Department modeled substantially on the lines suggested by Shattuck. This was the first attempt to foster public health on a state-wide basis. So well conceived was the law that it became the model for other state health departments. Following the lead of Shattuck in Massachusetts, Stephen Smith in New York and others in Pennsylvania were disclosing the unsatisfactory state of the public health in their areas.

In the meanwhile, the most significant discoveries in the history of medicine were being made. Pasteur in France and a little later Koch and others in Germany were demonstrating once and for all the rôle of bacteria in the causation of disease. A new era in hygiene was thus ushered in. Exact methods of medical research were established. Medical education, especially in Germany, was revolutionized. In the newly established laboratories, the great leaders supported by a host of skilled associates and eager students from all over the world were turning up the causative agents of one disease after another. The effect of these discoveries on public health work was epoch-making. The health program, which earlier consisted of little more than the eradication of filth and the control of other public nuisances, was gradually widened to include active preventive measures against the infections. In Berlin, in Munich, in London, and later in New York, health departments were translating the discoveries of the laboratories into effective practices in the newer public health work.

I should refer here to the pioneer work of a few American leaders in the last decades of the century. Dr. Henry Baker was responsible for the establishment of the State Board of Health in Michigan and his influence was felt widely in the setting up of other state health departments. Dr. William T. Sedgwick was a great power in developing the techniques for the control of environmental sanitation and in training a large circle of effective health workers. Hermann M. Biggs, helped to establish the Health Department of New York City on scientific lines. William H. Welch, first in New York and later at Johns Hopkins, developed national leadership in medicine and in public health, and was foremost in establishing the principle that public health work was an essential branch of medicine.

By 1900, the modern phase of the public health movement was well under way. As the result of the work of the leaders, the people of America, Great Britain, and western Europe came to realize that the preservation and advancement of the public health were functions not only proper to the State but essential to its survival under modern conditions. The first efforts were directed at the control of such infections as typhoid fever, tuberculosis, the communicable diseases of childhood, yellow fever, and that scourge of infants, diarrhea and enteritis. In this short article, it is obviously impossible to outline the steps in this extraordinary development. It is sufficient to say that out of these several efforts a new discipline of public health work was created covering a wide variety of specialties, including administrators, epidemiologists, bacteriologists, sanitarians, health educators, vital statisticians, and a host of physicians and nurses particularly skilled in applying the advances in medicine to the protection of the public health, be it in mother and child clinics,

in tuberculosis dispensaries, or the other services of the official health agencies. As more and more technically qualified men and women became available, health departments were strengthened. The dead hand of politics was gradually lifted. Health education and public interest increased and, at long last, funds became available to do the job in a workmanlike manner. In this wise, in spite of many vicissitudes, including two World Wars, the last fifty years have seen a steady expansion of the public health program and an achievement recorded never imagined by its founders.

It will now be well to see what has actually been accomplished during the course of the last century. I shall speak primarily of the achievement in our own country. But much the same story can be told of many others, especially the Scandinavian, the Netherlands, and Great Britain and her dominions. To be sure, it is somewhat difficult to make reliable comparisons of the mortality records of today with those of 1848 because of the differences in the classification of disease. Nevertheless, the following table will give a fair idea of what has been accomplished not only in the mortality as a whole but in some of the more important diseases which since the days of Chadwick, Farr, and Shattuck have received the concentrated effort of the leaders of medicine and of public health.

The earliest figures available for Massachusetts which have merit are for the period 1856-1865. The rates for 1848 would probably be somewhat higher and those for the larger American cities would be much higher. But comparing the earliest reliable figures for Massachusetts with those of 1945, we find a reduction in mortality of about 32 per cent for all causes combined. In England and Wales, the improvement was somewhat greater, namely, 43 per cent. More interesting are some of the details. Thus, infant mortality was re-

Comparative Death Rates (per 100,000) from Certain Causes of Death, Massachusetts, 1945, and 1856-1865, and England and Wales, 1945 and 1851-1860

| | Massachusetts | | | England and Wales | | |
|--|---------------|-----------|------------------|-------------------|-----------|------------------|
| | 1945 | 1856-1865 | Per cent Decline | 1945 | 1851-1860 | Per cent Decline |
| All Causes | 1,222.3 | 1,795.0 | 31.9 | 1,261.3 | 2,222.0 | 43.2 |
| Infant Mortality per 1,000 Live Births | 31.6 | 174.4 | 81.9 | 46.0 | 154.0 | 70.1 |
| Typhoid Fever and Paratyphoid | 0.1 | 92.5 | 99.9 | 0.1 | 57.0 | 99.8 |
| Diphtheria and Croup | 0.3 | 86.1 | 99.7 | 1.8 | 52.0 | 96.5 |
| Measles | 0.2 | 17.1 | 98.8 | 1.9 | 41.0 | 95.4 |
| Scarlet Fever | 0.2 | 101.3 | 99.8 | 0.2 | 80.0 | 99.8 |
| Whooping Cough | 0.5 | 23.8 | 97.9 | 1.8 | 50.5 | 96.4 |
| Smallpox | 0.0 | 11.0 | 100.0 | 0.0 | 22.0 | 100.0 |

* 1856-1860

† Comparable data not available

SOURCE: Data for Massachusetts for 1856-1865 abstracted from *The Diseases of the Inhabitants of the Commonwealth*, by Henry D. Chadwick, M.D., *New England Journal of Medicine*, June 10, 1937, pp. 1010 and 1013. Data for England and Wales 1851-1860 from *The Registrar General's Statistical Review*, 1923, p. 35, and England and Wales, *Annual Report of Births, Deaths and Marriages* 1920, p. 35.

duced 82 per cent in Massachusetts and 70 per cent in Britain. Typhoid fever has been virtually eliminated, the reduction in mortality being 99.9 per cent, and the same is true of diphtheria, measles, scarlet fever, whooping cough, diarrhea and enteritis, and smallpox. Great gains have also been made against tuberculosis. In Shattuck's day, the death rate in Massachusetts was close to 450 per 100,000; now it is less than 40 per 100,000. The reduction has been over 90 per cent. This disease was the first cause of death in the earlier period as well as an important cause of poverty and misery. It is now well on its way toward elimination. Pneumonia has shown phenomenal improvement in recent years. I could add quite a number of additional items to this table but enough have been listed to confirm the extraordinary value of the work launched by Chadwick and Simon and by their followers in various parts of the world. From the health standpoint, the world today is a very different place from that one hundred years ago.

Another way to gauge what has been accomplished is to compare the average length of life or the expectation of life

at birth at the beginning and at the end of this memorable century. In 1850, the expectation of life of a male at birth was 38.3 years in Massachusetts; in 1940, the expectation was 63.3 years. For white females, the figure in 1850 was 40.5; in 1940, it was 67.6 years. Because there has been some added improvement in the course of the last decade, we can safely say that between 1848 and 1948 there has been a gain of more than 25 years in the average length of life for males and of about 28 years for females. This improvement has, of course, been largely concentrated at the younger ages because the diseases which have been most reduced had their chief incidence in infancy and childhood. But we must not minimize the gains in early and middle adult life.

As a result of these gains, millions of people have been saved from premature death. The duration of the working period of life has been greatly extended, making possible increased production and a higher standard of living for all. Huge numbers have been enabled to reach the older ages, having enjoyed a full life freed, for the most part, from the heavy impact of the diseases which

plagued the population a hundred years ago. These advances have kept families intact and have, in fact, produced a very different atmosphere in which the average family can live. Widowhood and orphanhood, which produced enormous demands on our charities and welfare services, have been greatly reduced. Social service workers no longer need concentrate their energies on patching up the maladjustments that result from the premature death of a breadwinner but can now use their skills on positive programs to help people enjoy a rich and full life. It is not an exaggeration to claim that the current prosperity and leadership of the United States in world affairs flow in good part from the achievements of the last century in the field of medicine and its auxiliary health services.

The public health movement on its centenary is a full-grown development, not only in our country but throughout the civilized world. Here we have at last developed a large corps of well trained professionals who in their various specialties render an effective public service. In the states, we now have organized health departments manned, for the most part, with efficient, skilled personnel. Our larger municipalities and county jurisdictions are increasingly being served in this way. Not less important has been the growth of our federal health department. In spite of the limitations of our administrative system, it has served exceedingly well in stimulating the state and local official health agencies, in arousing public interest, in demonstrating the feasibility of certain health operations, and through public grants, has made local health services increasingly effective. In its ever-growing scope and function, the Service has demonstrated and justified the theory of governmental responsibility for the health of the people.

Supplementing the ever-expanding operations of the official health depart-

ments are those of the voluntary health agencies. This has been a singularly American contribution. Nowhere else in the world have these nonofficial agencies developed to such an extent or in such variety. Beginning early in the century, they have grown to include something like 20,000 separate organizations operating on the national, state and local levels and are concerned with virtually every phase of the public health program. Their function has been, on the whole to pioneer in demonstrating the activities necessary to attack one or another of the public health problems. In this connection, I am proud to mention the constructive rôle of the life insurance companies.

One of them has over a 40 year period developed a well rounded health program for its many policy holders. In coöperation with the National Tuberculosis Association, it helped to demonstrate how a community could bring tuberculosis under control. Other insurance companies have aided in the control of accidents. The philanthropic Foundations have played an important part in financing the training of health officers, in medical research, and in improving health administration. The voluntary health agencies often goaded the official departments to greater effort. Primarily, they have served to educate the American people with respect to public health and to make them aware of the services offered by the health departments.

In pausing to take stock of the public health movement at the close of a century, we may also venture an opinion on the future course of the program. We have still a long way to go before we have implemented and utilized our public health and medical knowledge to the full. The next decade or two will, I am sure, see an increasing development of official health service to cover every major unit of our population. The trend is clearly in the direc-

tion of making available to every community full-time, trained public health servants, more adequately supported to do essential health work. This, together with the advances being made in the organization of medical care, in the extension of our hospital facilities, and in the health education of the people, should result in such material achievements as the virtual eradication of tuberculosis and in further reducing the incidence of the infections.

Other areas of the public health, heretofore neglected, will certainly receive more concentrated attention in the future. The gains in longevity of which we are so proud have greatly increased the numbers of older persons in the population and have given greater emphasis to the diseases of middle life and old age, such as heart disease, arteriosclerosis, cancer, and arthritis. We have been prone to consider these conditions the inevitable consequence of the aging process and as such beyond preventive or remedial measures. This view has been shortsighted and not at all in line with the most recent developments in medicine. But we have at last awakened to the urgency of the situation, and a vast amount of research is now going on to discover the causes of cancer and of the other degenerative processes. With all this activity, it is only a question of time before their vital secrets will be revealed. Once they are known, it should be possible to determine the measures best adapted to counteract, or at least to postpone, the afflictions of old age. These activities will loom large in the health program of the immediate future.

Another field that must receive more concerted attention from the public health profession is mental hygiene. Mental disorders constitute a major problem in our complex civilization. Fortunately, there are indications that we now appreciate the gravity of the problem and are beginning to prepare

more trained people for this field of work. Our children will be better prepared for a healthy and normal life when such workers become generally part of the regular staff of our schools and colleges.

Much has yet to be accomplished in the reduction of accidents. Health officers have shied away from this field, and yet it is one in which they can play a very useful part. Accidents constitute the leading cause of death of children and young people and lend themselves to control, provided the necessary educational work is done. The public health profession is in a peculiarly favorable position to do it.

While the services of public health workers in the next century may not be as spectacular as in the past, they will be equally useful. It will all depend on the degree to which objectives will be reoriented and the necessary personnel trained to cope with the new problems which demand attention. Health officers will need to know more of mental hygiene, of social services, and of effective community organization. More and more, we shall count on them to organize the health services of the community, especially for older people. The aim will be not only to control disease but also to build up a population sound in mind and body—an objective in which all the civic agencies and the professional personnel, particularly the private medical practitioners of the community, can participate. We have the resources; we have the necessary local organizations. If health officers and their associates will step into the breach and make their office the center of health service in the truest sense of the word, those who summarize the record of the next century will have an equally inspiring story to tell. The public health profession will, I am sure, broaden its outlook. Through the World Health Organization we have joined hands with most other countries to raise the level of health on a global

scale. There are few forces which can exert greater influence to insure world happiness and world peace than uniting in this common cause.

In closing, I must extol the rôle of our own society in the extraordinary health developments of the last century. The American Public Health Association early took leadership and gave direction to the public health movement. The first officers of the Association were the outstanding physicians and sanitarians of their day, including, among others, Stephen Smith, Elisha Harris, and E. M. Snow of Providence. They helped to write the necessary legislation which led to the creation of state and local health departments. They set up standards of practice. The annual meetings of the Association gave opportunity for stocktaking, for vital discussions, and for the development of plans. A succession of truly great health administrators and teachers took their place

in the Association—Baker, Sedgwick, Frankel, Ravenel, Rosenau, Frost, Freeman, Winslow and many others. In good time, our *Journal* was issued. The Committee on Administrative Practice began its operations and for nearly 30 years has helped to establish the guiding principles which have raised the level of health work throughout the country. In numberless ways, our society has been in the forefront in health education, in setting standards of training of health personnel, and in developing the necessary leadership. Our society on this occasion can be very proud of the part it has played in the history of the public health movement in America. It is particularly appropriate that we meet in Boston on this occasion, when our President and our President-Elect are both good and tried Bostonians who have given many years to the betterment of health in their city and in the nation.

A New National Health Program for Canada*

G. D. W. CAMERON, M.D., D.P.H., F.A.P.H.A.

*Deputy Minister of National Health, Department of National Health and Welfare,
Ottawa, Canada*

ONE of the most important milestones in the history of health planning in Canada was passed in May of this year, with the announcement by the Prime Minister of the new National Health Program. Designed to effect general improvement in the nation's health services, and to prepare the way for a national scheme of health insurance, the program commits the federal government to an additional annual expenditure on health of more than \$30,000,000, through grants-in-aid to the provinces.

The new program continues the progressive extension of social security measures that has taken place in Canada during the war and post-war years. In 1940 the Unemployment Insurance Act was passed, followed by the National Physical Fitness Act of 1943, the Family Allowances Act of 1944, and the 1947 amendment to the Old Age Pensions Act which raised pensions for the aged and blind and increased the number to whom they might be paid. Comprehensive provision for the needs of veterans has also been made through development of the outstanding medical care and rehabilitation services administered by the Department of Veterans Affairs and by the increased veterans' disability and survivors' pensions which became effective in 1947. The same progressive trend has charac-

terized provincial legislation; there has been a general expansion and strengthening of health and welfare activities in all provinces.

An important factor in this many-sided development was the establishment, in 1944, of the Department of National Health and Welfare to take over the general health functions of the former Department of Pensions and National Health and to assume the leading federal role in welfare activity. One of the principal responsibilities of the department is the advisory, coördinating and assistance service it renders to the provinces in health and welfare matters which, for the most part, are placed under provincial jurisdiction by the British North America Act of 1867.

In health matters, the department, which will administer the new program, works in close coöperation with the Dominion Council of Health, the principal advisory body to the Minister of National Health and Welfare. As the membership of the Council, which meets under the chairmanship of the Deputy Minister of National Health, includes the chief health officers of all provinces, the provincial health departments have been able to participate actively in the planning of the grants and in the administrative policies governing their distribution.

The new program is designed to assist the provinces in a number of fields. It consists of three parts: the first a health survey grant; the second a group

* Presented before the Health Officers Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 12, 1943.

of grants covering general public health, tuberculosis, venereal disease and cancer control, mental health, crippling conditions in children, professional training and public health research; and the third, a grant to assist in the provision of hospital accommodation of all kinds. The program covers all areas of Canada with the exception of the Yukon and Northwest Territories where health services are a direct responsibility of the federal government. The extent and variety of the assistance it provides are indicated in Table 1, where the amount made available under each grant is shown.

Perhaps the significance of these figures may be most easily assessed when they are considered in relation to previous federal expenditures on health, and to annual amounts spent by provincial governments in the past. Under the new program additional annual federal expenditure on health and hospital services will be almost as great as

the total expenditure of the Health Branch of the Department during the previous 28 years of its existence, and more than twice the total of all government health expenditure of 20 years ago. Provincial expenditures on health and hospital services which in 1926 totalled \$10,600,000, or \$1.12 per capita, had climbed to \$40,000,000, or \$3.31 per capita, by 1945, the last year for which official figures are available, and to an estimated \$63,400,000, or \$5.05 per capita, by 1947.* This steady rise in provincial expenditure indicates why some kind of federal financial support has become essential if the level of services provided by the provinces is to be maintained and developed. Since the grants must be expended on new services, or matched by provincial funds, a guarantee is provided that this new program will mean an overall increase in total health services.

* Based on *Statistical Summary*, Bank of Canada, Aug.-Sept., 1947.

TABLE 1

Annual Amounts Made Available to the Provinces by the Federal Government under the New National Health Program

| Grant | Total Amount | Per Capita Amount ^a |
|--------------------------|-------------------------|--------------------------------|
| Health Survey | \$625,000 ^b | \$0.05 |
| Health Grants | | |
| Public Health | 4,395,300 ^c | 0.35 |
| Tuberculosis Control | 3,000,000 ^d | 0.24 |
| Mental Health | 4,000,000 ^e | 0.32 |
| Venereal Disease Control | 500,000 ^f | 0.04 |
| Crippled Children | 500,000 | 0.04 |
| Cancer Control | 3,500,000 | 0.28 |
| Professional Training | 500,000 | 0.04 |
| Public Health Research | 100,000 ^g | 0.01 |
| Hospital Construction | 13,000,000 ^h | 1.04 |
| Total: | \$30,120,300 | \$2.40 |

^a Based on intercensal estimate of population for 1947.

^b Non-recurring, but amounts not expended in the fiscal year will be made available in following years.

^c Based on payment of 35 cents per capita, and rising 5 cents per capita each year until a maximum of 50 cents is reached.

^d At the end of 2 years a supplementary grant of \$1,000,000 annually will be made available for 10 years to provincial governments able to make use of it.

^e Increased to \$5,000,000 at the end of 2 years; to \$6,000,000 at the end of 4 years and to \$7,000,000 at the end of six years.

^f An annual grant of \$225,000 was in existence prior to commencement of the program, so that this figure represents an additional grant of \$275,000.

^g Increased by \$100,000 annually, until the grant reaches \$500,000 per annum

^h To be reviewed at the end of 5 years, with possible reduction by half at that time

Comparison between the new program and the well established American grant system is perhaps inevitable. Both represent the extension of federal financial resources to provincial and state governments as a means of strengthening and developing widely diversified public health services. Both have as a basic consideration the necessity for retaining local autonomy and are directed against the same problems, though the older and more diversified American system includes grants not made in Canada, and an overall view of expenditures by the two federal governments would have to take into account the greater variety of methods used in the United States for the support of measures provided for in Canada by straight grants to the provinces.

The Canadian appropriations may at first sight appear to be relatively small when compared to the corresponding annual federal expenditure in the United States of close to \$120,000,000. However, when the populations of the two countries are compared, it is apparent that the Canadian program has been generously and boldly conceived. While, on a per capita basis, the individual Canadian grants for venereal disease control, crippled children, and public health research are slightly less than their American counterparts, the remaining grants all provide for substantially higher amounts.

The many similarities between the two programs are evidence of the attention that has been paid in Canada to American pioneering in the use of the grant-in-aid as a general health measure. The different health fields in which the grants are paid, and the amounts to be expended on each, were decided upon after extensive study of conditions and administrative methods both in Canada and abroad. The program itself grows out of the Dominion Government Proposals, made at the Dominion-Provincial Conference in

1945, which envisaged the establishment of a complete national system of health insurance as well as the strengthening of the nation's health services. Because agreement was not reached between the federal government and all provinces, the full proposals have never been implemented, but it was decided to go forward with the health grants as a logical program which stands on its own merits.

The amount to be distributed under each grant was calculated as closely as possible to meet estimated national requirements in each health field. In those grants where it is anticipated that the provinces will be able to absorb additional sums when the program has been under way for a period of time, provision is made for a progressive increase in the amount to be made available, as in the public health, tuberculosis control, mental health, and public health research grants.

The grants are for the most part distributed on a per capita basis, with special provision being made so that the smaller provinces will not be penalized by their lesser financial resources, and by the higher relative cost of the services they require.

Where, if distribution were made on a straight population basis, the smaller provinces would not receive sufficient funds for their needs, a fixed amount of the grant is paid to each province, with the balance being distributed on the basis of population. For example, under the Mental Health Grant, each province is first given \$25,000, with the remaining \$3,775,000 divided on a population basis; in the Venereal Disease Control, Crippled Children, and Professional Training Grants each province is similarly allocated \$4,000 before the remainder is divided. For the Tuberculosis Control, Health Survey, and Public Health Research Grants the distribution is somewhat different; for

tuberculosis control a basic \$25,000 is paid to each province, with half the balance allocated on the basis of population figures and half on the average number of tuberculosis deaths over the last 5 years; in the Health Survey Grant, Prince Edward Island is given \$15,000 and the other provinces each \$5,000, with the remaining \$570,000 divided according to population; the Public Health Research Grant is distributed on the basis of projects recommended by the Dominion Council of Health. The remaining grants are made on a straight population basis. The resulting distribution of the total grants between provinces is as shown in Table 2, which illustrates the greater per capita amounts payable to the smaller provinces under this arrangement.

TABLE 2

*Amounts Made Available to Provinces
under National Health Program,*

| Province | 1948 | Per Capita Amount ^a |
|----------|--------------------------|-----------------------------------|
| | Total Amount (000) | |
| P.E.I. | \$294 | \$3.13 |
| N.S. | 1,542 | 2.48 |
| N.B. | 1,226 | 2.50 |
| Que. | 8,985 | 2.42 |
| Ont. | 9,668 | 2.31 |
| Man. | 1,806 | 2.43 |
| Sask. | 2,002 | 2.38 |
| Alta. | 1,968 | 2.39 |
| B.C. | 2,529 | 2.42 |
| Total | \$30,020 ^b | \$2.39 |

^a Based on intercensal estimate of population for 1947.

^b Exclusive of Public Health Research Grant which is not allocated on a per capita basis.

The provinces are allowed wide discretion in the manner in which the grants may be employed. As in the United States, there is a great variation between the kind and quality of services offered, both between different provinces and between areas in any province. These differences, apart from the problem they present through the necessity of bringing badly serviced areas up to the general level, preclude any strict uniformity in the manner of

expenditure of the grants. It is recognized that different approaches to particular problems are essential, and will inevitably lead to the trial and exploration which are necessary if the best long-range results are to be obtained.

THE HEALTH SURVEY GRANT

In order that the provinces themselves may be able to survey their problems, and to insure that they be given all possible assistance in drawing up an integrated program of development and extension, the first of the new grants is devoted entirely to enabling them to determine existing needs, and the priority with which they should be met.

Through the Health Survey Grant \$625,000 is made available for distribution among the provincial governments, so that they may establish planning staffs, calling in outside help where necessary, to study and report on provincial requirements.

The conditions governing distribution of the grant do not rigidly limit the use to which it may be put. Its main purpose is to assist each province in the preparation of an overall appraisal of needs, which will serve as a guide in the future development of the total provincial health program.

Within this framework specific attention is being concentrated on planning for the utilization of the health grants themselves and on a survey of hospital facilities which will be used as a guide in the administration of the Hospital Construction Grant. In addition to providing for an inventory of existing facilities to be used as a basis for the determination of future needs, it is hoped that the grant will make possible their development in a coördinated and integrated fashion so that the most effective use may be made of funds available from other grants, and so that the provinces, with it, will be enabled to lay the groundwork for hospital and medical care insurance.

GENERAL PUBLIC HEALTH

The General Public Health Grant, which totals \$3,395,300 in 1948, is calculated on the basis of 35 cents per capita and will be increased by 5 cents per capita each year until a total annual per capita payment of 50 cents is reached.

The grant is intended for the strengthening and extension of public health services in those places where the provincial health departments feel the need to be greatest. It will enable the provinces to enter and explore fields of activity which have hitherto been inaccessible to them because of budget limitations. The creation of additional county and district health units, the expansion of existing units, and the development of public health education programs will all be encouraged, together with the strengthening of other aspects of the provincial services not covered by specific grants, such as the development or extension of programs in child and maternal health, blindness, arthritis and rheumatism, and communicable disease control.

TUBERCULOSIS CONTROL

The Tuberculosis Control Grant of \$3,000,000 is intended to enable the provinces to complete the task of obtaining control over tuberculosis and to assist them to provide free treatment for all sectors of the population. To insure that these objectives are reached, a supplementary grant of \$1,000,000 annually, beginning in the third year of the program, will be made available for distribution among those provinces able to make effective use of it.

The record of the provinces in the fight against tuberculosis has been generally very good, and outstanding work has been done in this field by the Canadian Tuberculosis Association. The progress that has been achieved is indicated by the fall in death rate from

200 per 100,000 in 1900 to 47.2, or below 40 if Indian deaths are excluded, in 1946 when the death rate in Saskatchewan was only 17.5.¹ An important contribution to the reduction of the overall death rate is being made by the Department of National Health and Welfare through the extension of the treatment and care of tuberculous Indians of whom less than 100 were under treatment in all parts of Canada in 1937, while over 1,200 are receiving treatment today.

Free treatment was given to 96 per cent of all patients in Canada in 1947, as compared to 73.4 per cent in 1938¹; all patients are now treated free by statute in Alberta, Saskatchewan, Manitoba, New Brunswick, and Nova Scotia; and in the other four provinces only a small number are required to pay any portion of treatment cost.

During the last ten years there has been a great increase in treatment and diagnostic facilities. Since 1938, almost 5,000 new beds have been provided for tuberculous patients and another 1,500 are under construction, and the number of persons examined at clinics has risen from about 166,000 to more than 444,000 in addition to the more than a million persons examined by mass surveys.

There has been great improvement also in the interest shown in rehabilitation of the tuberculous patient, which was pioneered by the Rehabilitation Service of the Sanatorium Board of Manitoba. Similar services are now being organized in Alberta, Ontario, New Brunswick, and in British Columbia, which also provides for tuberculous families. Such services as these should all be extended with the aid given through the new grant.

MENTAL HEALTH

As in other countries, the problems arising from mental illness are particu-

larly acute in Canada, and are complicated by serious shortages of all types of trained personnel and facilities for institutional care. It is estimated that, on the basis of requirements per 1,000 of the population of 4 beds for the mentally ill, 1.5 beds for mentally deficient persons, and 0.25 beds for epileptics, there is a shortage of almost 27,000 beds; if requirements are met on the basis of 5 beds per 1,000 there is a shortage of 17,000 beds for these cases. At the same time, on the basis of one mental health clinic for every 100,000 of the population, more than a hundred clinics are still required to meet the need of the provinces.

Because of the seriousness of the problem, as compared to tuberculosis, the formula for the mental health grant goes much beyond that for tuberculosis control, providing first for a higher initial amount of \$4,000,000 and, in addition, for three increases of \$1,000,000 each at 2 year intervals, as the provincial programs are able to absorb more money.

The grant is intended to supplement existing provincial and municipal services in every possible respect, with special emphasis on the development of clinical and preventive services. It may also be used for extending areas of free treatment, where no progress has been made in any way comparable to that for tuberculosis care.

The two most immediate problems which must be faced, however, are the provision of additional beds and the training of psychiatric and other staffs. While the Hospital Construction Grant will do much to assist the provinces in building the necessary extensions to their accommodations, a considerable part of the Mental Health Grant will be required to train the large number of qualified personnel that will be required before these new facilities can be made available.

CANCER CONTROL

The Cancer Control Grant of \$3,500,000 is the only grant included in the program which was not mentioned in the 1945 Proposals. At that time provision for cancer was made indirectly and for an unspecified amount, through the Public Health Grant. A separate grant to provide additional funds was decided upon in view of cancer's importance as the second greatest cause of death in Canada. The grant is intended to stimulate provincial action in the building up of a concerted, well planned and organized drive on cancer, including active diagnostic and treatment services, and to open the way toward free diagnosis and treatment in all provinces.

There is great variation in provincial cancer control programs. In some provinces services are relatively undeveloped, in others free diagnostic services are provided, while in Saskatchewan a complete free diagnostic and treatment service has been established. There are a dozen or more organizations active in cancer work, including the Canadian Cancer Society, which, with its provincial branches, carries on an extensive educational and fund-raising campaign, and the newly organized National Cancer Institute with which the Society is affiliated and which has as its principal function the stimulation and development of an intensive research program. Through the Institute it is hoped that all cancer research will be coördinated and integrated into a well planned and uniform pattern, regardless of the auspices under which the research projects themselves may be undertaken.

The new program complements but in no way supplants the work that is now being done; the larger part of the grant will be used for the establishment of clinics and facilities for diagnosis and treatment. It is estimated that the cost of complete cancer diag-

nostic and treatment facilities for all in Canada would be in the neighborhood of \$7,000,000 annually. The federal grant provides half this sum, and is conditional upon federal grants being matched by the provinces to provide the full amount required. The Cancer Grant thus differs from the other health grants in two ways—through the matching condition and because the provinces are not obliged to employ it on increased services.

VENEREAL DISEASE CONTROL

Under the new program the existing Venereal Disease Control Grant of \$225,000 is raised to \$500,000 annually. As free treatment is largely available in Canada, the increased grant is intended to extend the number of active clinics, to increase the number of persons engaged in preventive work, to develop rehabilitation programs where possible, to increase provision for drugs where necessary, and to extend educational work.

Federal participation in venereal disease control work began in 1919 when, on the recommendation of the Dominion Council of Health, \$200,000 was voted for control work. The amount voted was progressively decreased until, in the fiscal year 1932–1933, the grant was discontinued in spite of the contrary recommendation of the Dominion Council. Commencing in 1938, \$50,000 was again voted annually for the distribution of arsenical preparations. In 1943 this amount was increased by an additional \$175,000. The basis on which the grant was distributed was amended by Order-in-Council in 1945 to provide each province with a straight \$4,000, with the remainder apportioned on the basis of population, 85 per cent being allocated in cash and the remainder in educational and other material. The new grant allows for substantial increases in programs begun and maintained with the help of this grant.

CRIPPLED CHILDREN

The Crippled Children's Grant of \$500,000 is intended to assist the provinces in the development of programs for the prevention and correction of crippling conditions in children, and for the rehabilitation and training of crippled children.

Much work remains to be done in this field. The Canadian Council for Crippled Children, the Ontario and Quebec Societies for Crippled Children, the Junior Red Cross, and the service clubs of Canada have all performed valuable services; there are hospitals for crippled children in most of the principal cities, and some provinces have directed particular attention to poliomyelitis. But no well rounded program has yet been developed under provincial auspices. As a result of the increased assistance now being made available through federal funds it is anticipated that all provinces should be able to develop programs on a broad and comprehensive basis instead of, as in the past, confining themselves to one or two specific diseases or to particular areas.

In the development of the program, close attention is being given to all aspects of this type of work in both Great Britain and the United States. As plans develop it is hoped to draw upon the experience of the Children's Bureau of the Federal Security Agency whose coöperation and experience have proved invaluable to Canadian efforts in this field.

PROFESSIONAL TRAINING

The Professional Training Grant is intended to assist the provinces in the recruitment and training of the additional health personnel required to meet both existing shortages and those that will develop as the program proceeds. Because of the urgent nature of these personnel problems the amount made available annually under the

grant has been set at \$500,000, or twice the sum included in the 1945 Proposals.

Shortages of public health personnel of all kinds are as acute in Canada as in the United States. More public health doctors, public health nurses, sanitary engineers, inspectors, public health dentists and dental hygienists, trained mental health personnel, together with all other types of public health staff, are urgently required. The shortage of nurses is a very serious problem which will undoubtedly become more acute as the hospital construction program progresses. It is anticipated that a substantial portion of the grant will be required to increase the existing number of trained nurses, and it is hoped particularly that the provinces will utilize the grants not merely for the recruitment and training of nurses in accordance with traditional methods but also to explore new methods of nurse training and for the provision of other classes of hospital staff. A particularly interesting experiment is being carried out in Windsor, Ontario, at the present time, under which it is hoped to develop a training program which will produce a fully qualified nurse at the end of a 2 year period. Special attention is also being given to the training of nurses' aides in some provinces.

It is also hoped that, in the use of the funds being made available to the provinces through this grant, some method will be found for the pooling of resources, so that two or more provinces may unite in the financing or developing of common training programs to supply specific needs in different fields.

While the grant would be inadequate to provide for all training required by the provinces, the training of personnel for work in mental health, cancer, tuberculosis, and other fields covered by special grants may be financed through these grants. The Professional Training Grant, like the Public Health and

Public Health Research Grants, is intended in part to meet residual needs not specifically provided for in other ways.

PUBLIC HEALTH RESEARCH

The Public Health Research Grant is intended for the stimulation and development of public health research. The grant is limited to \$100,000 for the current fiscal year, but will increase by an additional \$100,000 annually, until it reaches a maximum of \$500,000. For the first year at least it will be administered as a separately operated fund of the Department of National Health and Welfare, to be expended on projects requested by the provinces and recommended by the Dominion Council of Health.

As with the Professional Training Grant, two or more provinces may combine in a research project or in subsidizing research. Expenditure for research in fields covered by other grants may also be charged against those grants.

The Public Health Research Grant is in addition to the amounts already being made available for pure medical research through the National Research Council, which appropriates some \$300,000 annually for this purpose. The grant will be used in a somewhat more flexible manner, for projects which seem promising but which for one reason or another may not come within the terms of reference of the Medical Research Committee of the National Research Council. Attention will be concentrated primarily on public health investigation as contrasted to medical research in the narrower sense, close coöperation being maintained with the National Research Council as well as with the National Cancer Institute, the Canadian Rheumatism and Arthritis Society, the provincial, university, and hospital research departments and laboratories, and with other research foun-

dations and organizations engaged in public health research.

HOSPITAL CONSTRUCTION

The \$13,000,000 Hospital Construction Grant is designed to remove the estimated shortage of more than 60,000 hospital beds in Canada, and emphasizes proper geographical distribution and allocation by type of hospital. By bringing about a more satisfactory distribution of hospital facilities it is hoped that the program will contribute to better distribution of doctors and health personnel.

In the 1945 Proposals, low-cost loans only were put forward as an aid to hospital construction, but the demand for accommodation, which had been rising through the depression and war years, has now become so acute that it was not felt that it could be met adequately by any system of loans. Normal population growth, increased hospitalization of obstetrical cases, advances in coverage of hospital insurance plans, and a greater all-round use of hospitals arising from the financial ability of a larger sector of the population to pay for services, have all added to the problem. Hospital construction, which had been slowed down during the depression, was practically stopped in the early years of the war, through shortage of materials and skilled labor. These shortages, plus tremendously high post-war construction costs, have been effective in preventing any large-scale resumption of hospital building. The shortage of beds is particularly acute in rural areas, and one of the purposes of the program is to insure that adequate new construction will be provided for all parts of the country.

The grant is also designed to relieve the present use of acute hospital beds by chronic and convalescent patients. There is no doubt that much hospital congestion today is due to the occupation of acute disease beds by large num-

bers of these patients, who require relatively long periods of care and who, if it were available, could be equally well cared for in accommodation which is less costly to build and maintain. The program therefore gives priority to the building of chronic and convalescent beds, by larger grants to this type of accommodation.

The federal grants for hospital construction are conditional upon the provinces at least matching the federal contribution. The grants will amount to \$1,000 per bed for each active treatment bed or bed equivalent, and \$1,500 per bed for each chronic or convalescent bed, with mental and tuberculosis hospital beds considered as chronic beds for purposes of the grant. The federal contribution will not in any case exceed one-third of the total cost per bed or bed equivalent in any construction project. Thus, under the program, local hospital authorities will be assured of a subsidy from the federal and provincial governments of at least \$2,000 for each acute hospital bed and \$3,000 for each chronic or convalescent bed. For purposes of the grant, three bassinets are considered equivalent to one bed.

Certain communities are unable to support hospitals of a size and character consistent with efficient and economic operation but require facilities where ambulatory care and treatment can be given, together with a limited emergency hospital care. A grant on the basis of beds would not in many instances meet financial need for the construction of such facilities. Accordingly the program provides that each 500 square feet of interior floor space, exclusive of staff living quarters, in an outpost hospital, nursing station, or similar establishment which does not contain more than eight beds, may be considered as the equivalent of one active treatment bed.

The assistance to hospital construction through this grant is conceived as a 10 year program. As it is anticipated

that the major financial obstacles will be encountered in its first 5 years, the program will be reviewed at the end of that time and, if it is found that the full subsidy is no longer required, the grant will be reduced accordingly.

COMMENT

The total program has been enthusiastically received, and accepted by all provinces. To assure that federal leadership and assistance are organized on as strong a basis as possible, F. W. Jackson, M.D., former Deputy Minister of Health of Manitoba and one of the ablest of the provincial health officers, has been brought into the Department of National Health and Welfare as Director of Health Insurance Studies, in which capacity he will implement the program. His proven ability and long experience in provincial health work will be invaluable during the exploratory period that lies ahead, and form an effective guarantee that the viewpoint of the provinces will be strongly

represented in all federal planning.

We appreciate the many difficulties, both seen and unseen, that remain to be solved. As in the past, we will rely heavily on the experience and advice of the great voluntary agencies and associations of professional workers, and on the assistance that is always so generously given by the United States Public Health Service and the Federal Security Agency.

With this aid the success of the program should be assured. The foundation on which it has been built is strong and, we feel, well designed. The co-operative planning that is now going on not only between the federal and provincial departments but between the provinces and the voluntary agencies is encouraging evidence of the stimulation that has been provided to the whole structure of Canadian health services.

Resolution 21 Adopted at the 76th Annual Meeting of the American Public Health Association, November 10, 1948

RECOGNITION OF INCREASED FEDERAL APPROPRIATIONS FOR PUBLIC HEALTH IN CANADA

WHEREAS, the health of the Canadian people is of direct interest and vital concern to this Association and to the people of the United States, and

WHEREAS, federal grants-in-aid in the United States have constituted a device of proven value in extending public health services and stimulating planned hospital construction, at the same time equalizing the financial burden nationally, and

WHEREAS the Government of Canada has embarked on a generous and far-reaching program of grants-in-aid to the Provinces for health surveys, general public health purposes, tuberculosis control, mental health care, venereal disease control, crippled children, professional training, public health research, cancer control, and hospital construction, therefore be it

RESOLVED that the American Public Health Association extends its hearty congratulations to the Government and people of Canada for a step which makes the year 1948 memorable in the annals of public health on this continent.

Health Centers and the Hospital Survey and Construction Act

V. M. HOGE, M.D.

Medical Director, Chief, Division of Hospital Facilities, U. S. Public Health Service, Washington, D. C.

HEALTH centers and public health activities are in a sharply focused rôle today in the national economy. Since establishment of the first health center in 1912, there has evolved a fairly consistent pattern of programs, services, and facilities. In 1915 there were 14 counties having full-time professionally staffed health units. By 1935 this number had increased to 762. Then the Social Security Act made possible a rapidly expanding health service. In 1947 there were 1,874 counties, with a total of 113,501,778 population, having full-time local health departments. Included were 272 cities with a population of over 42,000,000 with such health services.

In 1946, \$67,952,036 was spent for local health services, exclusive of state administrative costs. Of this sum, \$5,761,058 were state funds, \$49,562,977 local, and \$11,833,062 federal funds.

Despite this growth and expenditure, only about 10 per cent of the population mentioned above benefits from local units fully meeting public health standards.

The "Hill-Burton Act," enacted in 1946 by the 79th Congress as Public Law 725, paved the way for the nation to build more and better health centers in the next 5 years than in any similar period in the past. It also brought into sharper focus than ever before the place of the health center in the nation's total health picture.

The purpose of the Law as stated in

its first section is to assist the states in determining needs and planning and building facilities which can be effectively and economically operated for furnishing adequate hospital, clinic, and similar services to all their people. Among these facilities, the health center has a key position.

Since the first health center was established, the term "public health center" has acquired a variety of meanings. Most of these are included, however, in the Law's definition of a public health center as "a publicly owned facility utilized by a local health unit for the provision of public health services, including related facilities such as laboratories, clinics, and administrative offices operated in connection with public health centers." In the Regulations under the Act, further clarification is provided in the definition of public health services as "services provided through organized community effort in the endeavor to prevent disease, prolong life, and maintain a high degree of physical and mental efficiency."

In its years of development, the health center has come to be the focal point around which revolve the activities of the departments of public health, primarily those dealing with the prevention of disease. Hospitals, on the other hand, generally have been regarded as places where acutely ill persons are taken for treatment. This sharp separation of preventive and curative programs has been recognized by the Commission on Hos-

pital Care¹ with the following recommendations in its report:

1. Hospitals and health departments should coördinate their efforts and integrate their functions.

2. There should be close relationship between hospital and public health department programs so that educational activities of the hospital can include training in public health work.

3. Unnecessary duplication of effort and equipment should be avoided whenever possible through joint use of facilities by hospitals and public health departments.

Dr. Dean F. Smiley, in the report on *health centers for the Council on Medical Service of the American Medical Association*,² lists among his conclusions:

"1. It is recommended that public health centers be established as needed and as close as is practicable to hospitals and medical schools (if any) in base hospital service areas, intermediate hospital service areas and rural hospital service areas and that they be integral parts of base medical centers, district medical centers and community medical centers. It is, however, recommended that at every level the public health center be kept administratively independent and that the differing needs of hospitals and public health centers for quiet and for accessibility be kept in mind.

"2. Public health centers to serve as headquarters for county and multicounty public health units are much more urgently needed than are rural public health centers serving as extensions of county and multicounty public health units.

"3. It is recommended that in rural communities of 4,000 to 18,000, in need of sick beds but not large enough to afford a 50 bed general hospital, 'community clinics' of 10 to 40 beds be provided by hospital authorities rather than 'public health and medical service centers' provided by public health authorities. However, administratively independent public health centers may sometimes be advantageously housed in the community hospital or community clinic. Such community clinics should be so organized and administered that they will not infringe on the private practice of medicine by physicians.

"4. In those rural communities where bed service is available from neighboring community hospitals and the urgent need is for facilities for public health and diagnostic facilities it is recommended that the public

health center shall provide facilities not only for the traditional six point public health service but also for clinical laboratory service and limited x-ray service. Offices for the part-time use of the practicing physicians of the community should also be included if the physicians so desire.

"5. In the interests of economy and administrative efficiency it would appear generally wise to avoid combining medical service functions, hospitalization functions, welfare and social service functions or recreational functions with public health functions in the public health centers projected under the terms of the Hospital Survey and Construction Act of 1946. The public health center should, however, include facilities for meeting effectively any responsibility laid on the public health department by the local community."

The American Hospital Association and the American Public Health Association through a joint committee on co-ordination of hospitals and health departments, strongly urge closer relationship between these activities.³

The Public Health Service is in hearty accord with these recommendations and is giving every assistance to the states in promoting such relationships.

When a state develops a long-range plan, as required under Public Law 725, to meet its needs for hospital, clinic, and similar services, the coördination and integration of such services become a most important consideration.

The Act also will help bring about the building of health centers structurally more suitable for their many activities and services. Traditionally, the health center is the headquarters for the local health unit which carries on communicable disease and immunization services, sanitation, maternal and child health, laboratory, vital statistics, health education, and other preventive medical services.

If the center is to provide these services effectively and attract full community support, it should be a model. It must set an example of civic cleanliness, attractiveness, and decency.

Not only will the health centers built under the Act be more suitable, both in

structure and in services provided, but they also will increase significantly in number. Perhaps most important of all, they will be built where they are needed—which has not always been true in the past.

Various estimates have been made from time to time of the need for public health centers. The Hospital Survey and Construction Act states that, "the number of public health centers and the general method of distribution of such centers throughout the state . . . shall not exceed one per 30,000 population, except that in States having less than twelve persons per square mile, it shall not exceed one per 20,000 population." It is pointed out that these are limits in which federal aid may be used. They are generalized assumptions of approximate needs and are subject to adaptation to specific local requirements.

These maximum ratios prescribed by law, when applied to July 1, 1947, estimates of civilian population, indicate that approximately 4,850 health centers are needed in the United States today. Yet on the basis of the approved state plans for hospital and health center construction under Public Law 725, only some 425 acceptable health centers now exist—or approximately 9 per cent of the maximum number required. These figures clearly reveal the acute need for many more health centers.

An examination of the health center program for these states indicates that serious thought has been given to planning for adequate health centers to serve the local health units and the people of the state. One section of the Regulations specifies that, "the general method of distribution of public health centers throughout the State shall conform to the plan of organization of local health units within the State." As the result, each state was divided into areas served by local health units. In some states, these areas are called public health districts; in others, they are called public

health areas. Regardless of the name designated, they are in all cases geographical areas served by existing or proposed local health units.

The size of the public health areas varies from state to state. Several states* have designated each county as a public health area or a district; other states have combined two or more counties to form public health areas.

The number of public health centers planned for each area depends on its population and the policy established by the state agency. Thus, in several states,† one public health center has been planned for each area; although in several areas additional centers could have been planned on the basis of the maximum ratios prescribed by law. In other states, the number of public health centers planned is determined on this basis.

The states apparently have attempted to plan sufficient public health centers to serve adequately all existing or proposed local health units. But the total number of centers proposed by a state, together with existing acceptable public health centers, does not necessarily equal the maximum number permitted, by simple mathematical calculation. The total number of proposed and existing centers amounts to approximately half of the total number as determined on the basis of the maximum ratios under the Law.

In addition to planning public health centers on a state-wide basis, considerable progress has been made in the submission and approval of applications for health centers. As of October 1, 1948, 91 initial applications for health centers have been approved. Twenty-four of these applications are for health

* Alabama, Arkansas, Delaware, Maryland, New Jersey, North Carolina, South Carolina, and Tennessee.

† Alabama, Arizona, Colorado, Florida, Georgia, Idaho, Iowa, Kentucky, Mississippi, Montana, New Mexico, North Dakota, Ohio, South Carolina, South Dakota, Texas, Vermont, West Virginia, and Wyoming.

centers included in general hospitals; 2 are for combined health centers and laboratories; and the remaining 65 are for public health centers only. The estimated total cost of these 65 health centers ranges from approximately \$6,000 to \$226,000, with an average cost of approximately \$74,000 per health center. These differences in costs are due to the variations in size and services planned.

The possibilities of the program are

challenges to leaders in the hospital and public health fields. Coördination of efforts in curative and preventive medicine is necessary for full realization of better national health.

Orders Received for Manual of International Classification of Diseases, Injuries and Causes of Death

The World Health Assembly has adopted as part of its Nomenclature Regulations, 1948, the Sixth Decennial Revision of the *International Lists of Diseases and Causes of Death*. It will be published by the World Health Organization as its *Manual of International Classification of Diseases, Injuries and Causes of Death* at the end of this year. In the United States, the new Classification will go into effect on January 1, 1949.

The World Health Organization has no facilities for the distribution of the *Manual*. Therefore, the Council on Vital Records and Vital Statistics has agreed

to consolidate United States orders and to distribute the volumes when they are received from the World Health Organization. The price of the first printing of the new Classification is \$2.50 a set of two bound volumes, delivered to you. Orders should be placed as soon as possible to assure prompt delivery.

Orders should be sent and checks made payable to: Halbert L. Dunn, M.D., Secretary-Treasurer, Council on Vital Records and Vital Statistics, c/o National Office of Vital Statistics, Washington 25, D. C. Orders and checks should be sent to the Council by December 1 or shortly thereafter.

The Birth of a Section^{*}

H. E. KLEINSCHMIDT, M.D., F.A.P.H.A.

Medical Director, American Red Cross, North Atlantic Area, New York, N. Y.

OFFICIALLY, the Section on Public Health Education was born at the 52nd annual meeting of the American Public Health Association, held in Boston, November, 1923. Actually the birth took place in New York two years earlier at the Jubilee meeting of the Association—a propitious omen, borne out, thus far, by the successful career of the Section. Through the enterprise of Evart G. Routzahn, supported by William F. Snow and Lee K. Frankel, permission to form a provisional section on health education was granted by the Association's Governing Council, and two sessions were conducted under his leadership at the 1921 meeting. Good attendance and spontaneous interest persuaded the Council to continue the Section for another year, and, after an excellent showing of vitality at the 51st annual meeting held in Cleveland, the probationary period was again extended. At the 52nd meeting, held in Boston, the dynamic interest shown in the section could no longer be ignored by a seemingly reluctant Council, and the Section was ushered into the public health family as a full-fledged and legitimate member. Sturdy and strong today, this Section was born out of wedlock, so to speak, and spent its first two precarious years as a waif on the doorstep of the A.P.H.A.

It is true that the Section owes its existence to the foresight and labor of a few zealots. But its creation may be

considered also as one of the outgrowths of the turbulent times following World War I. What was the general political and social atmosphere like in the early 20's? Woodrow Wilson, frustrated and forsaken, sat hunched by the fireplace in his Washington apartment, broken in body and spirit. A war-weary nation was clamoring for "normalcy" under the presidency of the genial and reassuring Warren Gamaliel Harding. Scarcely had he died (August 3, 1923) of ptomaine poisoning, or a coronary occlusion, or phenobarbitol, or a broken heart—the public never really learned which—when the stench of the Teapot Dome scandal, which had been stewing for two years, polluted the air. The Prohibition Amendment, approved in 1919, was sowing the seeds of cynical lawlessness. The Ku Klux Klan was riding high. The Big Red Scare was slowly burning itself out. The Sacco and Vanzetti case was undermining our faith in the judiciary system. Radio broadcasting, not yet a year old in 1921, was already changing the social and economic pattern. The post-war business boom had encountered its first bust. Sex taboos were being demolished and a new but dubious "sex freedom" was screaming abroad in the land. Women's skirts were climbing to the knee. *Main Street* was a best seller; Mr. Babbitt was soon to become a national symbol.

These few highlights seen in present-day perspective, tell the story of a nation, which, having been keyed to a high, idealistic pitch by the war "to make the world safe for democracy," was, in the early 20's, nervous, fretful,

^{*} Presented before the Public Health Education Section of the American Public Health Association at the Seventy-sixth Annual Meeting in Boston, Mass., November 9, 1948.

morally confused, spiritually exhausted, and struggling, oh, so yearningly, for stability and creature comforts.

This restless and groping state of mind of the nation had its influence, of course, on public health thinking. But on the whole, that thinking was definitely progressive. In fact, the period might be called one of renaissance of public health, in which the A.P.H.A. shared. For a half-century the Association had been a tightly knit group of staid health officers, sanitarians, engineers, and laboratory technicians. But during and immediately after the war the concept of public health broadened perceptibly. Workers in the fields of social welfare, education, and medicine demanded a place in the public health field. Public health workers were beginning to be interested in something more than vaccination, formaldehyde, and the cuspidor-in-railway-cars index. We catch some reflection of this new and aggressive spirit in the pages of the *American Journal of Public Health*. In the 1921 volume, for example, we find papers in abundance on sewage disposal, food protection, sanitation problems, and a 30 page symposium on smallpox, but we find also a score card for measuring the efficiency of local health departments, worked out by the U. S. Public Health Service. One of its 21 items was "Education of the Public," for which 80 points were allowed out of a total score of 1,000. In the October, 1922, issue is an editorial based on a survey summarizing "Public Health Education" from which we learn, that: "In 80 per cent of the larger cities of the United States health education is a very incidental part of the municipal health department. . . . In the majority of cities, the director (of health education) is the health officer. . . . Not more than 15 cities are really getting health information into the homes of their communities."

Such an expression of concern about

the need of informing the people was new. Although there have always been outstanding teachers in the ranks of public health the emphasis, 30 years ago, was on legal regulations, sanitary policing, and technical measures. The printed publications of health departments were, for the most part, poorly written, badly printed, and generally unattractive. On the shelves in the basement of almost any state house were usually to be found a miscellaneous assortment of dull cards and sleazy circulars bearing instructions for persons quarantined with a communicable disease, printed in crowded type on dark paper; as forbidding in phraseology as they were hard to read. When epidemics struck, the newspapers carried fearsome messages written in the technical language of the doctor. Publicity, the average health officer seemed to think, was at best, a necessary evil.

In this bleak setting individual gleams of light do stand out. Biggs, Fulton, Crumbine, Hurty, Evans were some of the luminaries who not only sensed the need of enlightening the public but also displayed genius in doing so. But the chancleer that really brought the sun up over the horizon early in this century, was undoubtedly the voluntary health movement. The Society for the Study and Prevention of Tuberculosis led the way by creating techniques of proclaiming its message to all people, and organizing them into crusading groups. Early in its career it conducted a traveling exhibit, piloted by an exuberant, resourceful young man, Evart G. Routzahn. Up and down the country it made its way, leaving behind threads firmly tied to a great idea that later wove themselves into a vast network which we now call the National Tuberculosis Association. Soon after, the American Social Hygiene Association set out to smash the "conspiracy of silence" against sex; and when the war came this organization was instrumental in persuading the

Army and the Navy to employ the same educational hammer to combat the venereal diseases—an innovation unheard of in the annals of military experience. The venereal disease educational program carried on in the training camps, on the ships, and overseas was an amazing performance and its influence carried over into peacetime projects of many kinds and many organizations.

In the post-war period the public health nurse movement was gaining momentum. By 1922 the Red Cross Nursing Service had been extended to more than half of the counties of the United States. Visiting nurse associations were everywhere being established, health departments were adding nurses to the staff, and boards of education were accepting the school nurse as a necessity. From the very beginning it was held that the public health nurse is essentially an educator. Whether she was dispatched to the bedside of a harassed mother, or to quarantine a case of communicable disease, or to consult with the parents of a pupil in need of glasses, she bore a cheerful message, interpreted the medical facts, and inspired her clients to reach for better health. Here was an army of professional workers whose chief function it was to teach, yet without real training in the art of transmitting knowledge. Oh yes! the job was done superbly but many a nurse sorely felt the need of a guiding hand—nursing, she knew, is a craft, the details of which she had learned from experienced instructors, but teaching is also a craft, and for this she had had no formal preparation.

Shortly before our Section was born the Child Health Organization came into being. Through the genius of Sally Lucas Jean it came like a fresh breeze to revive interest in child health. Its printed publications vied with the best of professional advertising. The dry dusty bones of physiology, traditionally

offered to children as health education, gave way to charming plays, the clowning of Cho Cho, merry jingles, and other fascinating devices that appealed to the child's heart. There was a new emphasis on the delights of healthful practices; a fresh approach to the emotions of the youngster, his parents, and teachers. The Child Health Organization set a pace which other organizations, official and nonofficial, strove to follow.

These few examples illustrate the widespread interest in education as a means of promoting health, both for the individual and the community. It was new. Thousands of health workers were engaged in public education and were in dire need of teaching skill and modern tools. For a half century lip service aplenty had been duly paid to the premise that public health progress is dependent upon the understanding support of the common man but somehow the conscious, directed effort to cultivate the skill of spreading knowledge seemed not to have captured the imagination of the public health profession. Obviously the time was ripe for the gathering and organization of these amorphous forces.

Another influence was at work. The war had destroyed the old complacency and challenged traditional values. The nation was introspective and health agencies, in similar mood, were probing deeply into themselves. They bravely questioned the value of their own methods and materials. They "ate of the fruit" and became conscious; not of their nakedness, but of their awkwardness in proclaiming their causes to a sophisticated people. So they labored earnestly to bring their methods and materials in line with modern advertising techniques and educational philosophies. One noteworthy study of the actual value of a given teaching device was that made by Lashley and Watson of the Psychological Laboratory of the Johns Hopkins University. The motion pic-

ture, "Fit to Win,"¹ dealing with venereal disease prevention in drama form, was shown under their direct supervision to about 4,800 people in audiences of various types, and followed up by questionnaires, reports from field workers and physicians, and personal interviews. They attempted to discover, not only what the individual learned by viewing the film, but also how long the knowledge gained had been retained, to what extent behavior had been influenced, and what deleterious effects, if any, were suffered by viewing the film. The study was carefully controlled and the findings were interpreted with scientific objectivity.

There were other studies of similar nature all inspired by a healthy skepticism concerning the real value of methods in common use. Illustrative of this spirit is the statement announcing the first session of the provisional Health Education Section, namely: "the aim will be to take some first steps toward frankly facing the practical problems which need to be solved in order to secure the results desired from the millions of pieces of printed matter that are being distributed, the great number of addresses, and the increasing use of a growing variety of educational material."

And while these efforts to sharpen the new tool of health education were under way certain other developments were causing the more conservative leaders to be apprehensive. Press agency was being carried too far, they feared, and was taking on a yellowish tinge. One ambitious commissioner, for example, caused a string of freight cars to be hauled through the countryside by a locomotive fired with dried milk instead of coal. This was supposed to prove to an indifferent public that milk is a source of energy; and it must be admitted that the story "made the headlines" from coast to coast. Slogans with a punch but of questionable verac-

ity, jingles with more rhyme than reason, stunts suggestive of the circus spieler, threatened to undermine public trust in the word of the public health leader.

Health expositions, promoted by commercial interests and space-selling entrepreneurs, sprang up like a rash. No matter what a dealer might have to sell—chewing gum, or soap powder, or perambulators—he managed somehow to tie his sales appeal to health. Sprinkled in with the hucksters' booths were the less exotic exhibits of health associations and departments which supposedly gave the whole an air of scientific respectability. Several health officers of unimpeachable reputation were so impressed with the health exposition and supported it so ably that the movement seemed at one time to be about to sweep the country. One such exposition was held in collaboration with our own Jubilee meeting—the year we were born—a huge, sprawling affair covering acres of floor space at the Grand Central Palace in New York.

In summary, one might say that the forces or factors that led to the formation of the Section were these:

1. The drive of the times.
2. The broadening of the concept of public health.
3. The apprehension that health education, being "nobody's business," might run rampant and impede sound public health progress.
4. The realization that health education is a specialized craft.
5. The yearning of an army of unclassified workers for a common fellowship.
6. The enterprise of a few leaders.

We are fortunate today that the pent up energy of that day was wisely mobilized and directed into its present channel. It might easily have been dissipated, for most of those who needed and wanted help were affiliated with a variety of other organizations not then identified closely with public health. It was the vision of Routzahn, Snow, Frankel, and a few other leaders that

made it possible to gather these forces under the banner of the A.P.H.A. Their efforts are all the more laudatory because little encouragement came from the inner circles of the Association. Some members, quite honestly, believed that the Association would be weakened by a multiplicity of sections and they resisted, not only the formation of this Section but also of others clamoring to be organized. There were, at the time, seven sections: Public Health Administration, Laboratory, Industrial Hygiene, Food and Drugs, Sanitary Engineering, Vital Statistics and Child Hygiene. Surely, it was argued, every member should find congenial companionship in one of these sections. The new member eager for a bit of help in health education, who might be told by the veteran Association officer with the raised eyebrows, that by shopping around among the programs of these six sections he would find all the nourishment he needed, was not satisfied—this was new wine, actively fermenting, and the old bottles would not do.

There were others who no doubt felt that the demand for a new section was but a passing fad and an offshoot of the raucous times. Still others, were perhaps secretly delighted to observe the new trend and, tongue in cheek, raised only mild objections for no other reason but to put the aspiring Section on its mettle. At any rate, the Governing Council did approve the permanent formation of the Section at the 52nd annual meeting of the Association, held in Boston, November, 1923.

Once created, the Section grew lustily and soon established certain distinguishing bench marks which deserve enumeration.

1. Its annual meeting sessions were characterized by unconventionality. Instead of trite papers there were demonstrations, impromptu discussions, and lively audience participation. Experts in fields other than public health, such as typography, cinematography, advertising, psychology, took part in its programs.

2. The "clinic" method of studying materials and techniques became a hall mark of the Section. Year after year this type of presentation maintained its popularity. The willingness of groping health educators to submit their products to searching, sometimes ruthless, scrutiny in public, testifies to their spirit of honest self-criticism.

3. The Section established "headquarters" in the annual exhibit of the Association. Here were to be found portfolios of printed matter, publicity devices, gadgets, catalogs of visual aid materials, and posters strung on a line like Monday's wash. It was the rallying place of all loyal members, and all found treasure there. This service is now being creditably rendered by the Social Work Publicity Council.

4. The Section supplied a department in the *Journal*. Other sections, too, conducted special departments but this one was unusual. It consisted usually of brief items collected by the editor, Mr. Routzahn, from the four corners of the world. It was an exchange of bits of information, offered usually without comment for what they might be worth, and reminded one of an old-fashioned experience meeting.

5. Early in its youth the Section felt that it was not enough merely to plan an annual program, but that it should develop a means of aiding its members to become better craftsmen in the art, technique, and philosophy of health education. Not a single school of public health had anything adequate of this kind to offer. At the same time the Section's membership included specialists in a variety of skills such as no university could then provide. Why not bring the two together—the novices in need of training and the experienced craftsmen willing to teach? That led to the development of the Health Education Institute which flourished from 1932 to 1943.² This was one of the distinguished services of the Section which brought it fame and at one time caused some to fear that the Institute threatened to outshine the annual meeting itself.

Such were the beginnings. Of the original 17 pioneers* who were active

* Records of the Association list the following persons as being "active" in the Section as of 1921-1923:

Dwight E. Breed
(deceased)
L. D. Bulkley
(deceased)
Walter Clarke
Marjorie Delavan
Ray Everett
John Hall
Ira V. Hiscock
H. E. Kleinschmidt

Benzion Liber
Harry H. Moore
Raymond S. Patterson
Phillip S. Platt
Burt R. Rickards
Evert G. Routzahn
(deceased)
John Sundwall
James A. Tobey
Claire E. Turner

in the Section as of 1921-1923, 3 have died, 2 are no longer associated with it, and the remaining 12 still maintain a lively interest in it. Now that the Section has reached adulthood, these first settlers are naturally proud of its sturdiness and also concerned with its future. They might be tempted to ask some searching questions concerning past mistakes, present weaknesses, and future challenges, but wisely refrain from doing so, knowing that the oncoming generation, indebted to, or burdened by, its heritage, is merely amused and not in-

structed by the traditions and experiences of its forebears. These oldsters, however, fondly hope that the present custodians of the Section's fortunes will strive as zestfully and happily to carry on as their antecedents were to get started.

It Works in Seattle

Merged Official and Voluntary Public Health Nursing Agencies

EMIL E. PALMQUIST, M.D., M.P.H., F.A.P.H.A., AND
MARGUERITE PRINDIVILLE, R.N.

*Director of Public Health; and Director, Division of Nursing, Seattle & King
County Department of Public Health, Seattle, Wash.*

THE merger of the Seattle Visiting Nurse Service with the nursing services of the Health Department of the City of Seattle was accomplished in March, 1944. A report of this merger was published in the June, 1945, issue of the *Journal of Public Health Nursing*. Those who are concerned with this program in our community are still convinced that this merger is effective, is now on firm foundation, and is the most desirable way of operating a public health and visiting nurse program in our community, even though it is a large city. The idea of merger arose largely because of wartime and the resulting shortage of nurses. It became apparent to community leaders and to Dr. Ragnar T. Westman, Acting Commissioner of Health (new City Charter: Director of Public Health), that much duplication of effort between the two agencies could be eliminated by a merger. The same advantages now, in peacetime, are still present. Our experiences from the merger in our community have gained advantages we do not wish nor intend to lose.

Many inquiries have been directed to the authors and to the President of the Board of the Visiting Nurse Service about the merger during the past three years. The most frequently occurring question is, "What is the plan?" The "plan" is not peculiar to Seattle, and generally can apply to almost any community. It goes without saying, how-

ever, that every area and community differs in its historical pattern of community organizational makeup, which must be kept in mind, of course, in setting up a plan. In the early stages of the planning in Seattle and before the merger took place, much discussion and serious consideration of plans was given to every aspect, by both the public agency and the voluntary agency, before the merger occurred. It is essential, we believe, in the preparation of any plan, that it be worked out together. If the two groups are rather far apart in their thinking, then this situation should be realized and kept in mind. In our opinion, a merger should not begin until complete understanding occurs. A graphical plan of lines of administration should be drawn because this is an effective method of visualizing the organization in advance. A general agreement as to function should be noted in writing. Special city or county ordinance may be necessary.

Late in 1943, after general agreement between the agencies, which included the Seattle Visiting Nurse Service and the official agency as represented by the health officer, an ordinance was passed by the City Council and approved by the Mayor which provided the legal machinery for the merger and for the management and handling of the finances. In addition, a memorandum of agreement was prepared which is a working arrangement between the Board

of the Visiting Nurse Service and the Director of Public Health.

In the early planning stages of the merger in Seattle, a committee was created from the Board of the Visiting Nurse Service and from members of the City Council. This committee met several times. An attorney was present during the committee meetings for consultation. Many matters, of course, came up for discussion, one of which, for example, was the concern of the Board of the Seattle Visiting Nurse Service that the personnel of the nursing services should not be involved in any politics. Such fears were alleviated when it was pointed out that the personnel could be declared officially as city employees and be given civil service status. There have been three city elections since the merger, and the Health Department, including the personnel absorbed from the Visiting Nurse Service in the merger, has in no way been involved, nor been embarrassed in any way because of political considerations.

Many nursing agencies may hesitate to enter into an amalgamated or merged program for fear they will lose their identity. Members, particularly of the private agency, were pioneers in establishing its service in their community and have passed through many difficult situations and suffered many hardships in seeing it through. Naturally, when it comes to merging it and sharing it with some other agency, the fear arises that they lose control or, as stated above, "lose their identity." The way to solve this problem is to get together representatives of the private agency and of the official agency. There is nothing so good, we have found, as sitting around a table and talking things out. The experience we have had here has been a grand one. There is no risk in losing identity where there is understanding and vision for the common goal.

The Board of the Visiting Nurse Serv-

ice in this merger has remained a highly vital group and is enthusiastically interested in the overall public health nursing services. In addition, and because of the merger, the Board has also become interested in all phases of public health work because of their close association with the Health Department staff. The Board, in several instances, has been the vanguard of health information, interpretation, and other matters of public health importance in the community. The president of the Board is also a member of the Coordinating Committee of the Health Division of the Council of Social Agencies, which incidentally, is a long name for our Health Council. The Director of Public Health (Health Officer) is also a member. So, these two people not only work together under the merger within the Health Department, but also as members of the community health council.

It is also of interest that, since the merger, not one of the twelve committees of the Board of Seattle Visiting Nurse Service has ceased to function. Every committee has had its share in the broader vision of the merger. The Education Committee has found it a real challenge to orient new Board members, not only in the work of the Visiting Nurse Service but in the work of all of the Divisions of the Health Department. A one day institute for new Board and District Committee members this year included a visit to all Divisions of the Health Department. Public health nursing operating in every division, or its work being related to every division, has broadened its knowledge and increased its interest in the whole field. The Personnel Committee has now become familiar with civil service regulations, qualifications, limitations, etc. The Public Relations Committee now considers the entire Health Department and works with its health educators on publicity. The Budget Committee is familiar with the budget of the official

agency, as well as the budget of the private funds coming into the Nursing Division. The District Committees have helped to decorate and furnish the child health centers as well as the district nursing stations in the city. Its members also serve as volunteers in helping to conduct these clinics. The Medical Advisory Committee, consisting of private physicians appointed by the County Medical Society, meets with the Board of the Visiting Nurse Service, and also with the Director of Public Health. This committee is aware that the public health nurse serves the patient and family, and recognizes the public and private medical responsibilities involved. Members of the Medical Advisory Committee interpret the nursing service to the physicians who, thus, are made aware that there is no interference with the private conduct of cases and that the nurse can be depended upon to observe the proper ethics in care of their patients.

The Board of the Visiting Nurse Service participates in a democratic process as citizens and in no way interferes with the professional obligations of those whose responsibility it is to conduct the nursing program. The Board is fully aware of the need for the Director of Public Health to make all final decisions which he is authorized to do on matters concerning the Health Department and, of course, including public health nursing.

Inquiries are often made to the Director of the Division of Nursing as to how to differentiate and decide what to bring to the Board of the Visiting Nurse Service or what to bring to the Director of Public Health. She has found this no particular problem. It is, of course, not always possible for her to present problems to them simultaneously nor is it necessary. Who should be contacted first depends upon the situation. For example, anything dealing with civil service or a personnel problem would

first be taken up with the Director of Public Health and then reported to the Board. On the other hand, a situation dealing with the Community Chest would first be presented to the Board and then reported to the Director of Public Health. It is a matter of routine that the Director of the Division of Nursing reports monthly at the meeting of the Board of the Visiting Nurse Service. She also renders a monthly written narrative report as well as statistical report to the Director of Public Health. This is in addition to frequent conferences during the month with the Director of Public Health and the President of the Board of the Visiting Nurse Service. The important point is to keep both informed. If either one or both are involved in an important decision, the President of the Board or a committee of the Board will meet with the Director of Public Health and the problem will be worked out. The Director of the Division of Nursing, therefore, has the dual responsibility and task to feel the pulse of each, understand the philosophy of each, be aware of the responsibilities and interpret each to the other.

A frequent question asked of us is, "How is financing managed?" The money supplied to the Health Department by the city, including the Division of Nursing, is derived from tax funds. The money supplied to the Division of Nursing from the Seattle Visiting Nurse Service is received from the Community Chest fund on a deficit budget basis. Other funds received into the Visiting Nurse Service come from fees collected for morbidity bedside care service from those able to pay, from contracts with insurance companies, and from two voluntary health agencies: the local chapter of the National Infantile Paralysis Foundation and the local chapter of the Cancer Society.

All these private funds for the Nursing Division are handled through a Special Nursing Fund provided by city

ordinance in the office of the City Treasurer. All funds collected by the nurses are also deposited in this fund. A receipt for fees collected is made in triplicate by the public health nurse; one copy being given to the patient, a second to the office clerk in the local nursing center, and the third remaining in the receipt book to be reviewed by the state auditor annually. The clerk tabulates the fees, noting the nurse, the patient, and amount of fee on a special form. The total day's receipts are noted on another form. The receipts are delivered daily to the City Treasurer for deposit in the special nursing fund.

The money coming through the Seattle Visiting Nurse Service from the Community Chest is managed in this manner: Each month the Chief Clerk of the Health Department estimates the amount the Special Nursing Fund needs to meet the payroll for the number of personnel of the Division of Nursing budgeted for by the private agency, and he then sends the request to the Treasurer of the Board of the Visiting Nurse Service. Funds from the Visiting Nurse Service depository are, as requested by the Chief Clerk of the Health Department and as agreed upon by the budget for the merged program, then forwarded to the Special Nursing Fund of the City Treasury. The Treasurer of the Seattle Visiting Nurse Service, on the other hand, estimates the agency's own total needs, the greater part of which is its contribution to the Special Nursing Fund, as its part of the merger program. The Visiting Nurse Service in turn, requests the amount of the anticipated monthly budget deficit from the Community Chest between disbursements and receipts.

It is well to mention here that the Visiting Nurse Service, besides the money which it puts into the Special Nursing Fund as part of the merger, has a special expense account to cover its own needs, such as dues to the National

Organization for Public Health Nursing, for auditing of its private books, for convention expenses, printing, stationery, and other incidentals peculiar to the agency. It should also be noted that the Visiting Nurse Service accepts gifts and makes contracts with private companies and groups and receives money from foundations and individuals which goes into its treasury.

The Chief Clerk of the Health Department, at the time of his request to the Visiting Nurse Service for the needs of the Special Nursing Fund, renders a monthly statement of the money deposited in this fund from fees collected by the nurses for the preceding month and also the total up to the current month of the year. He also gives an accounting of the expenditures from the fund, as well as from the general fund of the city which goes into the Division of Nursing. A copy of this statement goes also to the Community Chest with an estimate of the needs for the succeeding month. A copy of the payroll from the Division of Nursing is also reviewed by the Finance Committee of the Board of the Visiting Nurse Service for their information.

Each year, at the appropriate budget preparation time, the Board of the Seattle Visiting Nurse Service and the Director of Public Health work out independent but integrated budgets. The Visiting Nurse Service works out its program share of the merger program and what will be needed from the Community Chest, etc. The Director of Public Health works out the budget for the Health Department, including, of course, the Division of Nursing. Since the Division of Nursing has the merged program, the budget prepared by the Visiting Nurse Service and this division's portion of the Health Department's budget must be integrated. Both of the budgets are presented to the City Council and also to the Community Chest so that each group, public and private, may

have a picture of the entire situation. The budget for the succeeding calendar year for the private agency is submitted in June and usually approved in July. The budget for the official agency is presented in July and not finally adopted until the first part of October. This difference in timing has led to some difficulty because of changes of salary schedule in the interim. This has necessitated a return to the Community Chest for adjustment of the private budget. There has, however, been good understanding, and the complication has been of little consequence.

It is assumed that payment for morbidity bedside care service on the basis of ability to pay, is a part of this program. It is interesting to note that full-pay service has increased as follows: 2,752 visits in 1942 (before the merger), 4,818 in 1945, and 5,615 visits in 1947. It is of interest to note also that calls from private physicians requesting nursing services have increased from 205 in 1942 to 526 in 1947.

We have found no difficulty in the collection of fees. No patient has ever questioned the nurse as to whether she is paid from tax funds or from private funds. As a matter of fact, the nurse would not be able to answer the question because she does not know. She does not need to be concerned with the administration of the merged service. The nurse need only, and rightfully, be concerned with the care of the patient.

Precautions are taken to avoid criticism that we charge for service to which the patient is already legally entitled. For example, in communicable disease control service, the first visit is always rendered without charge. Charges are made only for continued nursing care which would be beyond that offered by the Health Department in the past. The patient is asked to call in and request extended service and then may be billed for the nursing care.

Other questions sometimes put to us

concern the type of program. One, for example, "How do you differentiate between public health and visiting nurse service visits?" Briefly, we don't! Our conception of public health nursing includes morbidity bedside care. Besides, it is not important to differentiate unless division of financial support is assumed on this basis. A differentiation by us is almost impossible, and is impractical because there is a time element: who knows which services take longer unless a constant time study is done? Then, how can the fact be reconciled that all "visiting nurses" give an educational service and all "public health" nurses give some morbidity bedside nursing care? Both groups do a maternity program. Except for a few situations which are specifically noted by law or are accepted as a responsibility of the public agency, we have no clear line of duties. In Seattle, we do a family service, no matter what the purpose of the initial visit, and thus we do not question which service it was in relation to the old pattern. We believe that this gives the patients better service. This is especially desirable where case finding is a factor, such as in tuberculosis, orthopedic conditions, or cancer.

The need to maintain a balanced program is probably the most difficult problem we have to meet. The urgency of illness puts a strain on limiting morbidity service. The overwhelming desire of the staff to wipe out tuberculosis, on the other hand, makes us tend to throw great emphasis upon this part of the program. The less vocal and spectacular programs such as maternity and health education, could be neglected if ever-watchful supervisors and carefully interpreted statistics were not available.

The merged services provide a richer experience for the nurses. At the same time, our experience is that it takes a higher quality of staff person to carry on this type of program successfully. We

have found it necessary to carry on an intensive staff educational program. The nurse who has had both official and voluntary agency experience or that of a similar merged program is without doubt the best prepared for this type of program. It is especially important that the supervisors have an understanding of both types of programs. A supervisor must have an objective balance toward the responsibilities of both agencies and must impart to the staff a balanced selection of service.

We know that the attitude of some public health nurses has been that curative (morbidity bedside care) nursing is better done by less well prepared personnel than one who "graduates" into a purely educational program after serving a preliminary period in curative nursing. In the early days of Seattle's merged program a few nurses left the agency, or requested clinic positions at reduced pay, because of an unwillingness to participate in a curative nursing program. We believe that the combined or merged program is developing a new type of public health nurse who is more adaptable and better able to serve the family as a unit. The staff nurses find it a more satisfying experience to do everything for their families without any concern with the responsibilities of another agency. A number of well prepared public health nurses with vision have joined our staff because they wish to participate in a combined program.

It is difficult to prove that ours is a less-costly service. It seems obvious that with the use of the same administrative personnel and other avoidance of duplication, the expense must be less than if operating as separate agencies. The use of the same office space and office equipment, the same professional personnel, both staff and administrative, certainly results in less cost for the overall operation for the same amount of services rendered. It seems also evident that a public agency can operate

a fleet of automobiles cheaper than a private organization. The public agency also has the privilege of using public buildings for their offices at less cost. The public agency can often purchase its supplies through a central purchasing office as a part of the city government which can buy in larger quantities at reduced rates. Our experience has been that we have been able to render a better service, which means more for the money expended. Another advantage of the merged service is that the recipient does not have to analyze his problem and symptoms in order to conclude which of the various nursing agencies to call, because in Seattle the one office (merged service) is the only one available.

We reap the harvest every year of good work done a generation ago. We have a great responsibility to "sow well" for the future. In Seattle we believe that the interest and enthusiasm now shown will not burn out. Responsible leadership must be nurtured, not neglected.

Participation in the program is a democratic experience. For the nurse it is a richer, more stimulating experience; for the supervisors and the administrators it gives an opportunity to develop a nurse with a fine balance for selection of service and with broader vision. Financially, we are certain that the dollar goes farther, that more efficiency is rendered for the same amount of money expended, than would be possible with separately operating nursing agencies. The real value of the program is that the family which is served as a unit and which we wish to strengthen, finds a simpler and better way toward health for every one of its members through the more readily accessible and well prepared scientific worker and friend in the public health nurse. Well prepared and well informed leaders can surmount obstacles present in the old pattern without any serious conflicts if they have vision and the same high goal.

South Richmond Community Nursing Service

C. HOWE ELLER, M.D., DR.P.H., F.A.P.H.A., AND
CATHERINE L. AUSTIN, R.N.

*Director of Public Health, Richmond City Department of Health; and
Supervisor of the South Richmond Community Nursing Service,
Richmond, Va.*

FOR many years in Richmond, Va., as in many other cities, there have been three types of public health nursing carried out. As far back as 1900, the Instructive Visiting Nurse Association organized a bedside nursing program; in 1910 the Richmond City Health Department added public health nurses to its staff; and in 1911 the School Board began providing school nursing service. Since these three agencies were furnishing good and needed public health nursing services, they grew. Along with this growth, however, gaps and overlapping unavoidably developed.

By 1945 this problem, which had long troubled the administrators of the three public health nursing agencies, had become more and more obvious. As a result, the Richmond Area Community Council decided to provide for an analysis of all of the public health services of Richmond. A fact finding committee was appointed, and it was soon realized that there was need for a detailed and comprehensive study. Consequently, Nathan Sinai, Dr. P.H., Professor of Public Health Administration at the University of Michigan School of Public Health, and Alberta Wilson, R.N., staff member of the National Organization for Public Health Nursing, were invited to conduct a survey.

The survey was completed in January, 1946, and the findings and recommenda-

tions were made in the so-called Sinai Report. Those recommendations pertaining specifically to public health nursing were as follows:

1. That the three nursing services be integrated in a selected area of the City for a designated period of time as the first step in the ultimate amalgamation of these services.
2. That a committee be appointed by the three agencies to serve as a Committee on Public Health Nursing. Membership on this committee to include the following:
 - a. The Director of the City Department of Public Health.
 - b. The Director of Public Health Nursing, City Department of Public Health.
 - c. The Director of the Instructive Visiting Nurse Association.
 - d. The Director of the School Health Service.
 - e. The Director, Training Program, Public Health Nurses, Medical College of Virginia.

The first step taken in following the recommendations of the Sinai Report was the organization of an Interagency Public Health Nursing Committee. In addition to the membership listed specifically above, this committee has had additional representation from the District II Office of the U. S. Public Health Service, the Virginia State Department of Health, the Richmond Academy of Medicine, the Richmond Medical Society (Negro), the Board of the Instructive Visiting Nurse Association, the School Board, the Richmond Citizens Association, the Medical College of Virginia Hospital Division, and two mem-

bers at large. A smaller group of professional people, as recommended in the Sinai Report, has served as an administrative subcommittee of the Interagency Committee.

To assist the committees in making detailed plans for the proposed demonstration, the U. S. Public Health Service made available the services of Lillian Gardiner, R.N., through the State and City Health Departments. Eighteen months were spent in studying the programs, policies, and procedures of the agencies concerned; selecting the area for the demonstration; arranging the budget; selecting and assigning the staff; and preparing policies for the new service. Innumerable meetings of the two committees mentioned were held and in addition many conferences of working subcommittees on finance, records, personnel policies, publicity, and housing.

The Sinai Report had recommended that the three public health nursing agencies combine for the demonstration. The School Board, however, felt that the nurses under its jurisdiction should not participate at this time. Therefore, in order that the program would not be postponed indefinitely, it was decided to proceed with the Instructive Visiting Nurse Association and the Richmond City Department of Public Health participating. Representatives of the School Medical Service have continued to serve on the Interagency Committee and on the administrative subcommittee.

Official approval of the demonstration was given by the Richmond Area Community Council, the Richmond City Board of Health, and the Board of the Instructive Visiting Nurse Association. The understanding was that the period of trial would be approximately two years, at the end of which time it would be determined whether or not amalgamation would be spread to other parts of the city.

South Richmond was chosen as the area for the demonstration, which has since been called the South Richmond Community Nursing Service. This section of Richmond is separated neatly from the rest of the city by the James River, and the people in this area have a well developed sense of community responsibility. Furthermore, the population of about 30,000, including Negro and white, well-to-do and indigent, provides a representative cross-section of the City of Richmond.

The next step was the securing of a qualified supervisor who had had both nonofficial and official experience. The person selected spent about three months, before the actual inauguration of the service, becoming acquainted and putting into more final form a nursing procedure and personnel policy manual.

Another preliminary step was the preparation of the physicians, the public and special groups in South Richmond, for the new service. This was done by means of individual conferences, group meetings, and newspaper publicity.

December 1, 1947, almost two years after the Sinai Survey, the South Richmond Community Nursing Service began to function. It is jointly administered by the Instructive Visiting Nurse Association and the Richmond City Department of Public Health, through the administrative subcommittee of the Interagency Public Health Nursing Committee. Voting authority is limited to the directors of the two participating agencies and the chairman. All votes thus far have been unanimous.

The supervisor is directly responsible to the above committee. In addition to attending all of the Interagency Public Health Nursing Committee meetings, she also attends the meetings of the Board of Directors and the Nursing Committee of the Instructive Visiting Nurse Association. Twice monthly a conference is

held with the Directors of the Instructive Visiting Nurse Association and the Bureau of Public Health Nursing of the Richmond City Department of Public Health to discuss current problems of policy and administrative routine.

The budget for the South Richmond Community Nursing Service was drawn up to include both assigned personnel and cash contributions. The proportion to be forthcoming from each agency was determined on the basis of the total number of nurses on the entire staff of each agency. When either agency furnishes rent, materials, or services, proper credit is allowed. A bank account was set up in the name of the Service with funds advanced by the Instructive Visiting Nurse Association. The health department payments are made monthly on a reimbursement basis. One car, with necessary gas, oil, and maintenance, is furnished by each agency.

Four nurses from the health department and four from the Instructive Visiting Nurse Association volunteered, and with bags and basic equipment were assigned to the demonstration. This provides for essentially the same number of nurses as were assigned to the area by the two agencies before the beginning of the combined service.

One full-time secretary and a part-time clerk carry on the bookkeeping and clerical work.

Housing has proved to be a problem, since no available office space could be found in South Richmond. At present the City Department of Public Health furnishes the office headquarters in a building outside the area. Eventually it is hoped an office will be located in South Richmond itself.

The difficulties encountered in the actual rendering of the combined service were not too great. Each nurse was assigned to a district approximately half the size of the one she had originally covered. The staff nurses from each agency helped those from the other

agency to become acquainted with the policies and procedures with which they were less familiar. For a short period, field visits were made in pairs, and field supervision was afforded each nurse as rapidly as possible. Each staff nurse now has become identified as, and considers herself to be, a "community" nurse.

Of particular interest is the arrangement for the collection of fees for bedside nursing care. These are collected by the nurse giving the service, whether official or nonofficial. Special pads of numbered receipts are given to each nurse, and these state that the fees are being collected for the Instructive Visiting Nurse Association. After proper accounting, these are periodically turned over to this agency. This system was approved by the Richmond City Board of Health, in recognition of the fact that in an integrated service, while an official nurse may give bedside care, this is being compensated for by a voluntary nurse doing work that would have been rendered by the official nurse under prior circumstances.

The maternal and child health clinics in South Richmond have continued under the jurisdiction of the health department. Nursing personnel, however, is provided by the South Richmond Community Nursing Service, so that these services will fit into the generalized program.

A community nursing committee, which should be of invaluable help to the developing service, is still in the process of organization.

Although the South Richmond Community Nursing Service has been in operation only seven months, the expected advantages of integrated service are beginning to be apparent in several ways:

1. Quantitatively, both field services and clinic attendance have shown gradual, but steady increases.
2. Similarly, collections for bedside nursing have increased month by month.

3. The staff nurses are appreciating the advantages of smaller areas to cover, and of following through the families with all types of illnesses and health problems.

4. Better relationships with physicians are developing as they are beginning to realize that only one agency need be called. By offering needed service to the patients, a more co-operative attitude on the part of the physician toward preventive procedures is often achieved.

5. Slowly, the people themselves are beginning to realize that some of the past confusion, which resulted from the changing of nurses and agencies, is diminishing.

6. Improved interagency relationships, not limited to those primarily concerned, are resulting.

No fundamental unsoundness of the integration has become evident. There are, of course, certain administrative complications encountered in operating a joint service in only a portion of a city. Perhaps the greatest difficulties have been encountered in connection with record forms and personnel policies, in attempting to have them reasonably conform to the records and policies of both agencies. No attempt was made to achieve complete satisfaction at the beginning, and committees have continued to study and revise. Not only have improvements been made, but in many instances the participating agencies have adopted the newly prepared records and the revised personnel policies.

Actually there have been fewer com-

plications than anyone could have anticipated. This undoubtedly has been due mainly to two factors: first, the time and energy spent in planning the demonstration, and second and most important, the sincere desire on the part of all concerned really to make the plan work.

Even though complete integration has not been achieved as yet, in view of its fundamental soundness, eventual success would seem to be inevitable if all concerned will continue to keep the welfare of the community, rather than of the individual agency, as their main objective.

NOTE: Special credit should go to those listed, and many others who, unlike the authors, worked for the amalgamation from its inception:

Dr. W. A. Browne, Formerly Assistant Director of Public Health, Richmond City Department of Public Health; Virginia H. Campbell, Chief, Public Health Nursing, Richmond City Department of Public Health; C. Viola Hahn, Director of the School of Public Health Nursing, Medical College of Virginia; Dr. Charles L. Outland, Medical Director of the Richmond Public Schools; Dr. Jack B. Porterfield, Formerly Director of Public Health, Richmond City Department of Public Health; Eloise Robins, Secretary Health Section, Richmond Area Community Council; Julia D. Smith, Formerly Director of the Instructive Visiting Nurse Association; The Presidents and Board Members of the Instructive Visiting Nurse Association.

Comment of N.O.P.H.N. Field Staff on Seattle and Richmond Reports

HEDWIG COHEN, R.N., RUTH FISHER, R.N., AND
DOROTHY RUSBY, R.N., F.A.P.H.A.

*Assistant Director; Associate Director; and Assistant Director, National
Organization for Public Health Nursing, New York, N. Y.*

MEMBERS of the general field staff of the N.O.P.H.N. welcome this opportunity to comment on the successful experiments of combining official and voluntary nursing services in Richmond and in Seattle. Citizens and public health nurses in all sections of the country see in this type of community planning, and in this type of administration of public health nursing service, a practical present-day method of reaching the long sought goal of generalized nursing, in which one public health nurse, with adequate assistance from auxiliary workers and consultants in specialized fields, is responsible for the nursing care and health guidance of the entire family.

While it is true that each success story of the formation of a combination agency stimulates other communities to develop their services along similar lines, there are situations where the development of public health nursing services has not yet reached the stage where a combination agency is the best move. Therefore, we should like to emphasize the need for the local communities themselves to take full responsibility for study and development of nursing services in their own communities—using the experience of other communities as a guide. It will be noted that both Seattle and Richmond stress and stress again the importance of the *readiness* of the community to want to plan jointly. Since several patterns of or-

ganization are possible it is of first importance in joint planning to determine which pattern is best for the particular community.¹

It has been our task on occasion to discourage formation of a combination nursing service. One such instance occurred in a sizeable city that had never developed a service for the care of sick at home. In this community, until the full support of the medical profession and the full interest and financial support of the official agency could be secured, we recommended the development of a voluntary visiting nurse association which would serve as a demonstration to the people who use the service as well as to those responsible for its plan and administration.

We affirm our belief here that, when a community is ready, it is sound practice to combine public health nursing services in such a way that both governmental and voluntary agencies retain some financial and administrative responsibilities. As was pointed out in the study of combination agencies² such an organization may prove to be but an intermediate step in the transition from voluntary to governmental auspices, but it does preserve the vital and constructive assistance of the board of the voluntary agency as well as provide opportunities for further contributions of the lay public in the promotion of public health nursing and indeed of all phases of public health.

riers. Thus, these patients not only lived in a typhoid endemic area but were also exposed more or less constantly to reinfection. There were no important sex differences as to mental or physical condition.

Our study covers the period from January, 1942, until July, 1947. At the beginning date, 49, or 62 per cent, had been classified as carriers for 2 years. The 11, or 14 per cent of patients who were transferred, had been so classified for 3 months; and the remaining 19, or 24 per cent, were intermediate in duration. Forty-nine, or 62 per cent, of the 79 patients had positive bacteriological reports recorded in 1942, while 74, or 94 per cent, had positive reports in 1943. This apparent increase from 61 to 94 per cent was very probably due to the more thorough and complete examination of the carrier population in 1943.

During the 5.5 year period of the study an average of 30 cultures (S.D. ± 10) chiefly of feces and urine, were made on each patient, with an average interval of 2.2 months between cultures. *This represents the largest group of data obtained on a continuously observed group of typhoid carriers kept under relatively uniform conditions for so many years.*

OBSERVATIONS

Spontaneous Cures—Examination of the bacteriologic records of the currently negative patients shows that their feces and urine have been negative for a long period, although there was constant exposure to reinfection. In 19 cases the feces and urine have been negative for an average of 49 months, the range being 33 to 66 months. We believe that such patients may be referred to as spontaneously cured cases, and as refractory to reinfection. That is, 19, or 24 per cent, of the 79 cases became spontaneously cured during the 5.5 year period.

Seven of these patients have already (August, 1947) been officially released

as carriers. (In Illinois the criteria for official legal release are negative feces and urine at least 30 days apart for 8 consecutive months and two negative bile cultures 7 days apart, taken 30 days after the last negative feces examination.) Six additional patients are ready for release, terminal bile cultures having been completed, 3 others are ready for bile cultures.*

Currently Negative Cases—In 4 cases, from 3 to 5 bacteriologic examinations were made in 1947 and all reported negative. Because there were no cultures made on these cases in 1946 and few in 1945, the present status is not definite. It is probable that some or all of these cases would belong to the "cured" group if more data had been obtained.

Currently Positive Cases—In 56 patients positive cultures were obtained between January and July, 1947.

The Duration of the Carrier State in the Currently Negative or Spontaneously Cured Cases—The duration of the carrier state in the patients becoming rid of the organism ranged from 25 to 88 months, with an average of 48 months. Four of the 23 cases have been excluded because of uncertainty as to the dates on which they were declared carriers.

When the total number of cases spontaneously cured at a specified time is graphed, it is found that the total number of spontaneous cures varies almost directly with time.

The Sex Difference in the Incidence of Spontaneously Cured or Currently Negative Cases—A striking sex difference was noted in the incidence of spontaneous cures.

Of the total of 79 patients, 26, or 33 per cent, were males and none were currently negative. One male who had been negative for 4 years showed one posi-

* By March, 1948, all 19 of the cases which we call "spontaneous cures" and the 4 cases referred to as "currently negative" had been officially released as carriers by the above criteria.

tive feces test in May, 1947, and 2 negatives since. Of the 53 females, 23, or 43 per cent, are now negative by our definitions.

Rôle of Reinfection—No evidence has been found in the literature to prove whether the recurrence of positive feces or urine in a previously known carrier after an interval of 3 or more months is due to a reinfection or to the reappearance of the organisms from a latent focus of the original infection. In view of the incidence of spontaneous cures in this series (24 per cent) and the sex difference in their incidence, the matter of reinfection or recurrence was studied. For this purpose the terms reinfection or recurrence were employed synonymously to indicate the finding of one or more cultures positive for *Eberthella typhosa* following three satisfactory negative feces and urine reports, roughly at monthly intervals. We have included as recurrences those cases which have been negative for 6 or 8 months and then have shown a single positive feces examination followed by a series of negatives for several months. This may represent true intermittency of excretion. However, we suspect that such cases may be due either to an experimental error or to the patient ingesting infected food, the bacilli simply passing through as transients. For example, it has been shown¹⁵ that after the ingestion of dysentery bacilli there may be temporarily positive stool cultures without clinical evidence of infection.

Under the conditions defined, 38, or 48 per cent, of the 79 patients had 50 reinfections during the 5.5 years.

It was thought that periods of remissions and recurrences might be reflections of periods of increased and decreased activity of the laboratory. The statistical study of the data failed to show a significant correlation between the number of recurrences recorded and the number of examinations made. This

study also revealed that major epidemics of recurrences or exposure to reinfection did not occur during the 5.5 year period.

A significant difference in the sex incidence of recurrences was not found. Fifty-eight per cent of 26 males and 43 per cent of 53 females had recurrences. This is not a statistically significant difference, since it could occur by chance in 24 out of 100 similar instances.

The data were arranged to indicate the relation of the number of recurrences to the currently negative or positive state of the patient. In the males, no relation between present status and the number of recurrences exists. In the females, significantly more reinfections occurred in the patients who ultimately became negative ($\chi^2 = 5.04$; $p = 0.03$). However, this was not true of the group as a whole ($\chi^2 = 2.22$; $p = 0.16$).

Gall bladder function—Cholecystograms were made on 80 of the carriers in 1941 and on 60 in 1947–1948. We examined the x-ray films in 29 of the cases and compared them with films made in 1947. In 26 instances the films made on a given patient in 1941 were available for comparison with those made recently. In only one case was a definite change apparent, that being loss of the ability to concentrate dye (one test) in a male whose bacteriologic course was one of repeated brief recurrences.

The incidence of non-visualization was found to be higher among the currently positive females than among the currently negative females, but the difference was doubtfully significant (adjusted $\chi^2 = 2.36$, $p > 0.05$). It is interesting that the combined incidence of non-visualization in the cholecystograms taken in 1947–1948, namely 40, or 69 per cent, of 58 (excluding 2 "doubtfuls") approximates closely that incidence found by Saphir, *et al.*¹⁴ in films made in 1941, namely 57, or 71.3 per

cent, of 80 cases. Other comparisons were insignificant.

DISCUSSION

According to the observations, a spontaneous cure of the typhoid carrier state (2 year records) occurred in 36 per cent* of 53 females but in none of the males. This observation is most provocative.

For example, it is ordinarily reported that the incidence of typhoid fever is higher in males than females and that this has been changed by the vaccination of soldiers against typhoid.¹⁶

In studying carriers more than a year after the attack of typhoid fever most authors report finding 3 to 5 females for 1 male. None of these reports provide the number of acutely affected males and females from which the carrier males and females observed were derived. That is, the sex incidences of the carrier state which have been reported are not true sex incidences. This criticism does not apply to our data because the sex distribution in the Manteno State Hospital was equal and all typhoid carriers are sent to the cottage in Manteno. So the preponderance of females, namely 53, over males, namely 26, is viewed as a true sex incidence. It is necessary, however, to note that in the data of Schwob, *et al.*¹³ a sex difference in incidence of the carrier state in the cases at Manteno occurred only in the group having had clinical attacks of typhoid fever. There is no preponderance of females among those carriers detected by survey of the remainder of the hospital population.

Several explanations for the apparently greater incidence of chronic typhoid carriers among females have been offered, such as the greater frequency of gall bladder disease in women,¹⁷ lowered resistance due to menstrual loss of blood,¹ and "circulatory disturbances

incidental to pregnancies and household work."¹⁸ In view of the well known rôle that the gall bladder plays as a focus in the typhoid carrier state, the bacteriologic course of the carriers should possibly be correlated with disease of the gall bladder. It could be anticipated that in the patients becoming cured spontaneously the disease of the gall bladder underwent spontaneous improvement. Or, on the other hand, chronic inflammation and fibrosis of the gall bladder might possibly be expected to progress over a period of years to cause "functional cholecystectomy," such that the organ would be incapable of supporting bacterial growth. Our data, however, suggest but are not adequate to substantiate strikingly, that the ability to concentrate dye in the gall bladder is present to a greater extent in the currently negative females than in the other patients.

Analysis of recurrences in this study did not show a significant overall sex difference, but the females becoming negative did have more recurrences than either males or finally positive females. This would seem readily explained by the fact that in order to have reinfections it was necessary to have cleared up the original infection. *Because the negative cases were free of the organism for such a long period in the presence of exposure (average 49 months), they must have developed a true resistance to reinfection.* After once clearing up, it is possible that reexposure to infection induced a level of immunity high enough to provide successful resistance to the continuous exposure to the organisms during subsequent years. We can offer no explanation of the remarkable sex difference in the ability to develop such resistance.

SUMMARY AND CONCLUSIONS

1. The bacteriological records of 79 typhoid carriers, 26 males and 53 females, have been studied over a 5.5 year

* Cf. footnote, p. 1676.

period. They all lived in the same building and were fed from the same kitchen in which typhoid carriers were present. The exchange of food between patients occurred. In view of these facts all these patients were continuously exposed to reinfection to approximately an equal extent.

2. Nineteen of the 79 cases became spontaneously cured during the 5.5 year period within 33 to 66 months after having been designated chronic carriers approximately 3 to 12 months after the initial infections in 1939.

3. All those who manifested a spontaneous cure were females; that is 19, or 36 per cent, of the females were spontaneously cured.

4. Reinfections or recurrences were frequent, with no sex difference. More recurrences were noted in females becoming negative than in males or in currently positive females. Cases were classified as having recurrences when they showed one or more positive feces or urine examinations after a period of 3 or more months of negative feces examinations.

5. Cholecystograms taken before and after the 5.5 year period of observation revealed no significant changes to have occurred during that time. There was no apparent sex difference in the incidence of non-visualization at either time. There is a doubtfully significant difference between the spontaneously cured and the currently positive females.

Penicillin or Silver Nitrate as a Prophylactic Against Ophthalmia Neonatorum?

CONRAD BERENS, M.D., AND FRANKLIN M. FOOTE,
M.D., F.A.P.H.A.

*Vice-President and Executive Director, National Society for the Prevention of
Blindness, Inc., New York, N. Y.*

MANY have asked whether penicillin should replace silver nitrate as a prophylactic in ophthalmia neonatorum. Gonorrheal ophthalmia has been successfully treated with penicillin during the last few years; however, penicillin as a prophylactic agent is still in the experimental stage, despite recent reports in the lay press giving the impression that the value of penicillin for this purpose is proved.

The District of Columbia and all of the states except Utah have laws or regulations requiring the use of a prophylactic agent in the eyes of the newborn. In most instances the law either leaves to the discretion of the state health department the type of prophylactic agent to be used or specifies, "one per cent silver nitrate or equally effective agent."

The chief work reported on prophylaxis with penicillin has been carried on by H. C. Franklin of the U. S. Public Health Service, who first used four instillations of penicillin (2,500 units of the sodium salt per ml. of sterile isotonic sodium chloride) during the first three days of life,^{1,2} and later used a single instillation.³ In these combined studies a total of 2,138 infants were treated with penicillin as the prophylactic agent and no known case of conjunctivitis was caused by the gonococcus. In the group receiving a single in-

stillation, 1½ per cent of the infants exhibited pus in the eyes while in the nursery. The staphylococcus was found in cultures from the conjunctivae of 80 per cent of these infants. In his first study, Franklin used as controls 749 infants who received routine silver nitrate prophylaxis. Among these, one child developed gonorrheal ophthalmia. It is obvious that this result is not statistically significant, and Franklin stated: "That the *Neisseria gonorrhea* organism was found in one instance after silver nitrate prophylaxis, and in no instance after penicillin prophylaxis, is instructive but not conclusive."²

Recently silver nitrate has been attacked in the popular press as being ineffective and harmful. However, a report⁷ adopted in June, 1948, by the Council of the American Academy of Ophthalmology and Otolaryngology and by the Section on Ophthalmology of the American Medical Association referred to these allegations as preposterous.

It will be recalled that Credé turned to silver nitrate only after first trying prenatal treatment with vaginal douching at the time of delivery, and after experimenting with several other antiseptics as prophylactic agents in the eyes of the new-born. After adopting silver nitrate prophylaxis in addition to prenatal care the incidence of ophthalmia neonatorum in his clinic dropped

from 10.8 per cent to 0.2 per cent or less.⁴ In the period following Credé these figures were confirmed by many other investigators. Lucien Howe summarized these, showing an incidence of 9.2 per cent of ophthalmia neonatorum among 17,767 births before use of the Credé method, followed by an incidence of 0.65 per cent among 24,724 births after silver nitrate prophylaxis was adopted.⁵ Coincident with the increased use of silver nitrate as the preferred prophylactic agent in the United States, new admissions to schools for the blind from this cause have dropped from 28 per cent in 1908 to under 3 per cent for 1945-1946.

Regardless of the effectiveness of a prophylactic agent, it is inevitable that there will be cases of ophthalmia neonatorum for two reasons: (1) carelessness on the part of the attendant in instilling the agent; (2) introduction of infection some time after the agent has been instilled. Therefore the occurrence of rare cases of ophthalmia neonatorum may be expected as long as the infectious agents themselves are found in a community. Because of better prenatal care today, and improved methods and facilities for the treatment of gonorrhea as well as other infections producing ophthalmia neonatorum, it will require a far larger study now than in Credé's time to establish the value of any new prophylactic agent.

The facts with regard to possible ill effects of silver nitrate are clear. There is no evidence that permanent damage results from the use of 1 or 2 per cent silver nitrate. Solutions left standing may reach a concentration as high as 50 per cent. For this reason, it has been suggested that silver acetate be substituted, since it appears equally effective but becomes saturated at 1.2 per cent. However, furnishing 1 per cent silver nitrate in paraffin-lined beeswax ampules, as supplied by most health departments, has overcome danger to

the eye from high concentration of the drug. A study by the National Society for the Prevention of Blindness in 1948, based on reports by 57 professors of obstetrics in approved United States medical schools, showed that 49 were using these ampules. These professors reported 112,035 live births in their services in 1947. They reported only 67 cases of ophthalmia neonatorum. Many of these cases were due to infections other than the gonococcus. Of the 67 cases 2 had some corneal damage. There was no damage from silver nitrate among the 112,035 live births.

If it should be established that penicillin or other antibiotic is as good as silver nitrate, it will be some time before the mode of administration, the strength of solution, and many other important factors are determined. For practical reasons, silver nitrate in paraffin-lined beeswax ampules is to be preferred at the present time for home deliveries.

Following several months' study, a subcommittee of the New York Academy of Medicine, on February 10, 1948, recommended, "that no change be made in the *Sanitary Code* to require the use of penicillin for the prophylaxis of ophthalmia neonatorum until there is more experience with its use."

On June 21, 1948, the trustees of the Association for Research in Ophthalmology adopted a resolution as follows:

It is resolved that at the present time the state of knowledge concerning prophylaxis of ophthalmia neonatorum is not sufficiently settled to permit a recommendation of any change in procedure, but instead research along this line should be encouraged.

On June 26, 1948, both the Council of the American Academy of Ophthalmology and Otolaryngology and the Section on Ophthalmology of the American Medical Association approved a report of a joint committee which concluded as follows:

In view of the incomplete present state

of our knowledge on this subject, your Committee deploras the recent article in . . . (popular magazine) . . . and is in full agreement with the conclusions and recommendations embraced in the report of the Sub-Committee of the New York Academy of Medicine—namely, that no changes be now recommended in the existing laws. It is the further opinion of your Committee that while it is possible, indeed even probable, that some form of antibiotic prophylaxis will eventually replace the present use of silver nitrate, that much further investigation of the matter is needed before any concrete recommendations can be made. Such investigations are now in progress in established clinics, and it is hoped that the answer may ultimately be forthcoming.

In conclusion, it is our opinion that no change concerning the use of prophylactic agents in the prevention of ophthalmia neonatorum should be recommended at the present time. However, carefully controlled research with silver nitrate, penicillin, and possibly

other antibiotic agents should be encouraged in institutions where such investigations can be carried out under strictly scientific conditions and with adequate controls.

Age Distribution of Poliomyelitis in New York City in Relation to Previous Epidemics

ALFRED YANKAUER, JR., M.D., M.P.H., AND
HENRY P. GOLDBERG, M.D.

*Office of District Health Administration, New York City Department of Health,
and the Department of Public Health and Preventive Medicine, and the
Department of Pediatrics, Cornell University Medical College,
New York, N. Y.*

IT has been stated that the character of poliomyelitis in the United States has undergone a striking change in the last 50 to 60 years.¹ Although the disease had been observed for a long time it has only recently been described in epidemic form. This change has taken place during a period when other infectious diseases have been brought under control primarily by improvement of sanitary conditions.

In contrast to the development of epidemics in the United States epidemic poliomyelitis is much more rarely observed in regions such as China, the Philippines, and the Middle East, where sanitary conditions are generally primitive.² This seems surprising since it has been shown that the virus of poliomyelitis exists in feces³ and sewage⁴ and contaminated food.⁵ In addition there is evidence that the poliomyelitis virus does exist in these regions. Neutralization tests have revealed the presence of antibodies in 85 to 90 per cent of the population,¹ and American soldiers stationed in these areas have shown a markedly higher incidence of poliomyelitis than either the native population or the troops at home.²

These observations led Sabin to suggest that in regions such as those referred to, the virus was so widespread

that most children contracted the disease early in life.² He further suggested that during infancy infection with poliomyelitis virus might produce clinical disease infrequently but result in long-lasting immunity. The transfer of antibodies to the fetus from an immune mother might provide the mechanism for such a modification of the disease.⁶

It was considered possible to examine this hypothesis by studying the age distribution of poliomyelitis in successive epidemics. If it is assumed that the virus becomes widespread during an epidemic a large number of passively immune infants might develop an active immunity from a modified form of the disease. This event might be reflected in a diminished incidence of poliomyelitis for this group in later epidemics.

MATERIAL AND METHOD

Epidemiologic data accumulated in New York City made it possible to investigate the hypothesis presented above. Well demarcated epidemics of poliomyelitis occurred in 1931, 1935, and 1944. As Figure 1 indicates, the intervening years were relatively free of the disease.

Every reported case of poliomyelitis in New York City was visited by a physician trained in the diagnosis of

FIGURE 1
POLIOMYELITIS CASES IN NEW YORK CITY 1925-1947

the disease. A form was completed summarizing the clinical, laboratory, and epidemiologic findings on the basis of which the diagnosis was confirmed or discarded. A follow-up visit was also made by a physician 6 months to 1 year after the case had been reported.

The material for this study consisted of the records of each individual case of poliomyelitis reported to the New York City Health Department in 1944, an epidemic year, and in 1940 through 1943, non-epidemic years. The following data were abstracted from each record: single year of age, sex, borough of residence, and clinical diagnosis. The diagnosis of cerebral or spinal poliomyelitis was made only on the basis of clinically demonstrated paralysis. The diagnosis of abortive poliomyelitis was made only on the basis of both abnormal spinal fluid findings and a positive history. The spinal fluid was considered abnormal if more than 10 white blood cells per cu. mm. were present with or without an increase in protein content.

The history was considered positive if stiff neck and/or muscle pains were present without clinically demonstrable paralysis. Other symptoms and signs usually found in poliomyelitis were not considered essential for the diagnosis.

Cases which did not fit these criteria were discarded for the purpose of this study. The vast majority of cases classified as cerebral or spinal poliomyelitis also had typical spinal fluid changes, but there were a few cases with paralysis in which a lumbar puncture was not performed. Almost every case was hospitalized.

RESULTS

The age distribution of poliomyelitis in New York City for 1940-1944 is presented in Table 1. It will be noted that the number of poliomyelitis cases in children who were under 1 year of age at the time of the 1931 and 1935 epidemics is not lower than might be expected.

Figure 2 gives a more complete break-

TABLE 1
*Age Distribution of Poliomyelitis Cases in New York City, 1940-1944 **

| Age (Years) at Time of Contracting Poliomyelitis | Year in Which Poliomyelitis Was Contracted † | | | | 1944 | |
|--|--|------|------|------|-----------------|----------|
| | Number of Cases | | | | Number of Cases | Per cent |
| | 1940 | 1941 | 1942 | 1943 | | |
| Under 1 | 1 | 4 | 1 | 4 | 13 | 0.8 |
| 1 | 2 | 10 | .. | 10 | 75 | 4.6 |
| 2 | 5 | 17 | 4 | 24 | 99 | 6.1 |
| 3 | 2 | 30 | 4 | 22 | 112 | 6.9 |
| 4 | 2 | 23 | 4 | 31 | 111 | 6.8 |
| 5 | 5 | 25 | 5 | 35 | 142 | 8.7 |
| 6 | 3 | 26 | 6 | 31 | 143 | 8.8 |
| 7 | 6 | 23 | 7 | 20 | 139 | 8.5 |
| 8 | 5 | 20 | 1 | 25 | 123 | 7.6 |
| 9 | 3 | 34 | 9 | 21 | 98 | 6.0 |
| 10 | 1 | 19 | 7 | 17 | 79 | 4.9 |
| 11 | .. | 27 | 2 | 21 | 80 | 4.9 |
| 12 | 3 | 20 | 3 | 15 | 85 | 5.2 |
| 13 | 3 | 17 | 6 | 13 | 59 | 3.6 |
| 14 | 2 | 14 | 3 | 13 | 51 | 3.1 |
| 15 | 2 | 6 | 2 | 7 | 38 | 2.3 |
| 16 | 1 | 8 | .. | 4 | 56 | 3.4 |
| 17 | .. | 5 | 1 | 2 | 26 | 1.6 |
| 18 | .. | .. | 1 | 4 | 16 | 1.0 |
| 19 | .. | 4 | 1 | 1 | 14 | 0.9 |
| 20-24 | 3 | 7 | 1 | 2 | 30 | 1.8 |
| 25-34 | 1 | 5 | .. | 5 | 34 | 2.1 |
| 35-44 | .. | 2 | .. | 1 | 4 | 0.2 |
| 45 and over | .. | .. | .. | .. | 3 | 0.2 |
| Total | 50 | 346 | 68 | 328 | 1,630 | 100.0 |

* Cases which would have been under 1 year of age at the time of the 1931 and 1935 epidemics are set in bold-face type.

† Includes both paralytic and non-paralytic cases.

FIGURE 2
AGE DISTRIBUTION OF POLIOMYELITIS CASES IN
1944 NEW YORK CITY EPIDEMIC

down of the 1944 epidemic. It is apparent that no correlation exists between the age at the time of previous epidemics and age at the time of the 1944 epidemic.

Additional analyses of the 1944 data were carried out. Cases were distributed by age, sex, and clinical diagnosis (cerebral, spinal and non-paralytic). In none of these classifications was it possible to demonstrate any decrease in the number of cases in relation to previous epidemics. A similar analysis was made for each of the five boroughs of New York City. No significant variations were observed.

COMMENT

A proper evaluation of the results requires careful consideration of certain aspects of the data.

All children whose ages were given as 9 and 13 at the time of contracting poliomyelitis in 1944 were considered to have been under 1 year of age at the time of the 1935 and 1931 epidemics, respectively. This assumption stems from the fact that the disease occurs in the main at the same time of the year in both epidemic and non-epidemic years. The peaks of the epidemics in New York City were reached in the first week of August in 1931 and in the last week of August in 1935 and 1944, and in all, over 90 per cent of the cases were reported between the last week in July and the first week in October. Thus the age given at the time of the 1944 epidemic permits an accurate estimate of age at the time of previous epidemics. The same principles with regard to age are applicable to all ages for every year studied.

The group of children who were considered under 1 year of age at the time of the 1931 and 1935 epidemic might have ranged from 1 day to 11 months. If they had been between 6 and 11 months old they would not have been expected to possess as much passive im-

munity as younger infants. It was possible to ascertain the exact birth date of 112 cases in the 9 and 13 year old groups of the 1944 epidemic. Of this random sample, 50 per cent were born in the 6 months prior to August 1, 1931 and 1935. Thus in the group of children under 1 year of age at the time of previous epidemics there was no preponderance of 6 to 11 month old infants.

In comparing numbers of cases in any one age group with those of another age group the population at risk may be of some importance. In the decade 1930-1939, the birth rate in New York City decreased quite regularly at an average annual rate of 2 per cent.⁷ For this reason it is believed that the factor of population at risk can be disregarded.

It is of importance for this study that children who developed poliomyelitis in 1944 should have been born in New York City and exposed to either the 1931 or 1935 epidemic. In addition the factor of migration itself might be large enough at all ages to influence the results. The exact birth place of 97 cases in the 9 and 13 year old groups of the 1944 epidemic was investigated. Of this random sample 2 cases were born outside of New York City, 4 cases could not be traced, and the remainder were born in New York City. Therefore, the factor of migration presumably did not affect the results. The results obtained in this study therefore do not seem to support the hypothesis that contact with the virus of poliomyelitis in the first year of life may produce long-lasting immunity in spite of the absence of clinical disease. This failure might stem from the following causes: exposure of infants during the previous epidemic may not have been widespread; epidemics may be caused by different strains of the virus which do not produce cross-immunity; immunity developing from contact with the virus of poliomyelitis may not be long-lasting; other factors

may be responsible for the epidemiologic patterns of the disease.⁹

There are many reasons for believing that the virus of poliomyelitis is widely distributed during an epidemic, but the exact extent of exposure is unknown. Several studies have indicated the widespread existence of minor illnesses suggestive of abortive poliomyelitis during an epidemic.^{8,9} The virus has been found in the pharynx and stools of asymptomatic contacts of patients with poliomyelitis.¹⁰⁻¹² Sewage during epidemics contains enormous quantities of the virus.⁴ In addition to the above evidence, the relatively high attack rate for the 1-2 year age group in urban epidemics⁶ makes it probable that infants are as likely to be exposed. However, this type of data supplies only circumstantial evidence of exposure during an epidemic, and the question remains an open one.

The existence of antigenically different strains of the virus has been made clear.^{2,14} However, it has not yet been shown that epidemics result from different strains.

The question of immunity after an attack of poliomyelitis has been recently discussed by Bridge.¹⁵ He and others¹⁶ have reported second attacks of the disease. However, such recurrences are apparently unusual and the general opinion is in favor of a long immunity following contact with the virus.

SUMMARY

The results of this study suggest that no immunity in excess of that in others was afforded to those individuals who

had been under 1 year of age at the time of previous epidemics.

Paper and Paper Board in the Food Industry—Public Health Aspects

FRED W. TANNER, PH.D., F.A.P.H.A.

Department of Bacteriology, University of Illinois, Urbana, Ill.

FORTUNATELY for the papermaker, the procedures which have been developed over many centuries, and which seem to be necessary for making paper as we know it today, are powerfully germicidal for microorganisms of public health significance and even for those which are not. The following brief outline lists some of them.

1. Pulping of the wood
 - a. Chemical pulping under pressure
 - b. Grinding hot, mechanical pulp
2. Bleaching with strong chlorine and hypochlorite
3. Drying on rolls of papermaking machines
4. Calender rolls
5. Wrapping for shipment

WOOD PULP

Wood pulp for papermaking is made in several ways from various woods, fir, hemlock, pine, spruce, poplar, and a few others. The wood may be pulped chemically or ground hot, which gives what is spoken of as chemical pulp or mechanical pulp. Sanborn¹¹ stated that "the preliminary treatment of pulp wood in the sulfite digesters exerts a definite sterilizing effect (140° to 145° C.) with a possible maximum of 155° to 160° C. (Johnsen⁶). Numbers of microorganisms are effectively reduced in ground wood pulp due to the high temperatures attained during grinding." Sanborn then stated that the temperature in the groundwood is usually in the vicinity of 85° which is insufficient to eliminate spore-bearing bacteria and mentions finding *Bacillus vulgatus* as

being isolated in pure culture from hot groundwood in one mill. This organism is a widely spread harmless saprophyte and is of no significance. Whether it would be advisable to heat at temperatures sufficient to remove organisms of this type is doubtful. Ubiquity of these bacteria in nature would make it easy for the pulp stream to be inoculated again. This might result from various foci in the mill system, from process water, and from the air. As Sanborn¹¹ stated, the diluted pulp at this stage is a good medium for bacteria, since it contains all of the constituents of the wood, important among which are wood sugars desired and easily utilized by bacteria. While the types of bacteria encountered here may cause trouble in the pulp and paper mill due to slime formation, they are not harmful to human health. The bacteriological purity of wood pulp is easily maintained by effective use of chlorine or chloramines and bleaching compounds.

Another factor which does much to keep the pulp in satisfactory condition is general "good housekeeping" in the mill. A strict regimen of sanitation has been found to be desirable and necessary in order to keep the mill free from colonization by troublesome bacteria. This is accomplished by proper construction of vats and pipe lines as well as by generous use of flushing water, thorough cleaning, and a constant residual of chlorine as mentioned above. Papermakers have long since learned that it

is better to prevent operating troubles and losses in the manufacturing process due to microorganisms than to cure them once they have appeared.

DILUTION OF WOOD PULP WITH WATER

The pulp which is to be made into paper is carried through the paper mill in water. Whether this process water needs to be of potable quality is open to question because any pathogenic bacteria which might be introduced are destroyed by subsequent steps in the mill. Introduction of the paper mill container made it seem desirable to exert greater effort to eliminate introduction of microorganisms which might cause economic losses, as well as to prevent entrance of those of sanitary significance, even though it has been known that such types would be entirely destroyed in the papermaking process. Contaminated stream waters are easily treated by settling if necessary, and by chlorination which reduces the viable bacteria to practically zero and eliminates all coliform bacteria which are the accepted indicators of pollution. There is no problem in securing a plant water from which objectionable bacteria would be absent. Any which would survive would be harmless spore-formers. A residual of chlorine is maintained, the effect of which is evident well through the mill system. Where mills re-use water which is chlorinated heavily, this water may be added to fresh water to secure sufficient safe water for the mill system.

STARCH IN PAPER MAKING

Starch is used for sizing paper and at times has been a source of microorganisms. Frieden⁵ stated that the types of bacteria present in starch are those which are prevalent in the atmosphere, and that the number present in starch depends first on the chemical treatment to which the starch has been subjected during manufacture and the conditions under which it has been

stored, including air and handling equipment. The actual types of bacteria reported were again the aerobic spore-formers and a few molds. Since these species are so widely distributed in nature, the few which would be added to paper in the starch sizing would be negligible and without significance from the sanitary standpoint. Frieden also pointed out that starch serves a useful function in paper by binding the water, making it unavailable to the bacteria which may be present in the paper. Rowland¹⁰ discussed the methods of application of starch and pointed out that failure to use accepted methods may lead to difficulties, some of which have bacteriological significance. Papermakers recognize the necessity of using starch which has been treated to lower the number of viable bacteria as is the case in the canning industry.

SLIME

Owing to the evil connotation of the word "slime," it is perhaps well to discuss it in a paper of this nature. Sanborn defined slimes as masses of growth built up on surfaces over which pulp suspensions flow. Bacteriological examinations of these masses have revealed a multiplicity of types all of which are of no sanitary significance but are troublesome to the papermaker. These masses may appear, in the finished paper, to cause what the papermaker calls "fisheyes." Sanborn mentioned five groups of bacteria which he had isolated, as follows: *Achromobacter*, *Escherichia* (one species not a coliform), *Aerobacter*, *Pseudomonas*, and *Bacillus* species of the *B. vulgatus* and *B. subtilis* species. Sanborn also mentioned the mold-like species, members of the genera *Oidium* and *Monilia*. Nason, Shumard, and Fleming⁷ reported several different filamentous and capsulated types of microorganisms which are troublesome in this respect. They are species with no sanitary significance and are easily con-

trolled by use of such a fungicide as sodium pentachlorophenate. *Escherichia coli*, the indicator used in sanitary work, has not been reported in slimes.

Many of the slime-producing bacteria are species of low heat resistance even though they are spore-formers. Results of an experiment with two such species were reported by Tanner, Wheaton, and Ball¹² which emphasized the lethality of various steps in the paper mill, i.e., pH, high temperature and moisture. *Aerobacter aerogenes* and *Bacillus peptogenes*, both isolated from slime in a paper mill were easily destroyed in three menstrua from vat pulp at pH 3.5, 1 per cent pulped paper at pH 4.6, and 1 per cent pulped paper at pH 7. The non-spore-forming *Aerobacter aerogenes* was destroyed by heating in these menstrua in 1 minute at 230° F., while the spore-forming species was completely destroyed in 3 minutes at 230° F., and markedly reduced in numbers in 3 minutes. Such results show the efficient germicidal action of various procedures necessary for making paper, whatever its ultimate use.

EFFECT OF DRYING ROLLS ON BACTERIA

These are a bank of steam-heated cylinders, as many as 100 or more, on cylinder board machines over which the web of pulp is threaded on the paper-making machine to remove the water. These rolls are heated to temperatures which ultimately reach 285° F., especially those toward the dry end of the web. At the wet end the temperature may be considerably lower because of the heat required to warm the pulp and water in it. Bacteriologists familiar with the factors involved in destruction of microorganisms by moist heat will readily recognize here a step in paper manufacture which possesses great significance in making paper safe for the food industry. This position has been substantiated by results of several experiments with pure cultures of bacteria

which have been sprayed on the web of paper as it was passing over the drying rolls.

Results of one experiment by Wheaton showed that non-spore-forming bacteria (*Escherichia coli*) cannot survive the drying rolls. A young suspension of a strain known to have higher heat resistance than ordinary strains, was sprayed onto the web of pulp just prior to its passage over the drying rolls. This suspension contained 486 million cells per ml., and about 10 ml. were sprayed over a length of paper about 18 ft. long and 12 in. wide. The web was moving at a rate of about 92 ft. per minute. The average temperature of the drying rolls was 250° F., the maximum being 270° F., the time for passage of the web over them being 6 minutes. None of the 40 samples of paper gave positive results for the test organism. It is significant to point out that the inoculum used was much heavier than would be expected in practice. Results of another experiment by Tanner, Wheaton, and Ball¹² confirmed these observations. They used suspensions of three organisms, a heat resistant strain of *Escherichia coli* (Frank), *Staphylococcus aureus*, and an anaerobic spore-forming organism of quite high test resistance. Suspensions of these bacteria were sprayed on the wet formed sheet just before it reached the first bank of drying rolls. Six ml. of heavy suspensions of the above mentioned bacteria were sprayed over a section from 12 to 15 ft. long and from 2 to 3 in. wide. These inoculations were heavy and undoubtedly much heavier than would be found in practice if, indeed, such bacteria could ever reach this point in a paper mill. The surface temperature of the rolls measured with a pyrometer varied from 220° F. to 235° F. Only one of the species used could be isolated from the finished paper, the spore-former, which was found in specimens taken for examination in numbers from

150 to 3,080 per gm. Isolation of this bacterium indicated that the technic employed was satisfactory and that failure to isolate the other organisms was not due to faulty methods of inoculation or sampling. The heat resistance of the *Escherichia coli* suspension was 21 minutes in phosphate buffer at pH 7 with 216 million cells per ml. Results of a more comprehensive experiment by Appling and Shema² may be reported because it is important to bring out what happens to bacteria on the drying rolls of a papermaking machine. They used suspensions of *Escherichia coli*, *Serratia marcescens*, *Staphylococcus aureus*, *Aerobacter aerogenes*, and *Bacillus mycoides*, an aerobic spore-forming bacterium. Only this last mentioned organism survived the drying rolls as has been the observation of previous investigators.

Prucha and Tracy⁹ also observed the destructive efforts of the drying rolls on *Escherichia coli*. Water used in one mill contained the organism but it was absent in the paper.

That paper leaving the drying rolls is therefore not sterile but contains viable spore-forming bacteria, is well known; but these species are not pathogenic.

LONGEVITY OF BACTERIA ON PAPER

Results of many experiments have shown that bacteria do not live long on paper but die out in a short time depending, of course, on the conditions of storage. In one experiment paper-board used in the food industry was sterilized in the autoclave, and then dipped into a heavy suspension of *Escherichia coli* (2,500,000 per ml.) and allowed to stand in it for several minutes. The strips were then drained and placed in the incubator at 37° C. (98.6° F.). At subsequent intervals samples were removed and analyzed for viable cells per gram of board. The first examination was made after 35 minutes and showed 360 bacterial cells

of *Escherichia coli* per gm. Gas formation occurred in lactose fermentation tubes. The next examination was made after 24 hours' storage at the above mentioned temperature when no viable *E. coli* cells were obtained and fermentation tests were negative. Similar observations were made after 96 and 120 hours with similar results, showing that bacteria of the coliform type die out very rapidly on paper-board. In another experiment, paper-board immersed for 3 minutes in a suspension containing 16,000,000 cells of *Escherichia coli* per ml., during which time 10 gm. of suspension were absorbed and the paper, containing 730 cells per gm. after drying for 2 hours at room temperature, was sterile in 12 hours by both standard agar plates and fermentation tube tests. The death rate is very rapid for bacteria on paper-board.

Frieden⁵ stated that the moisture content of paper (about 6 per cent) is too low to allow bacterial development and that it was probably present as bound water, not available for microorganisms. He believed that presence of starch binds water and makes it unavailable to bacteria, thus speeding their death. Whatever the reasons may be, those who have studied this problem, have had similar experiences.

In the early days of the paper milk container when it was under critical examination and the materials from which it is made were also being studied bacteriologically, experiments were carried out to determine the effect of the hot paraffin used for water proofing, on bacteria, in and on paper-board. Since the paper-board contained no bacteria of sanitary significance, strips of it were either sprayed with or soaked in heavy suspensions of these bacteria to make certain that they were present. It was observed, however, that as these strips dried prior to paraffination, the bacteria died quite rapidly. Prucha⁸ made a similar observation.

SANITARY PAPER

Attempts were initiated about ten years ago to introduce a "bacterial count" as an index of quality of paper for use in the food industry. Unfortunately, this count of not over 250 bacteria per gm. has been used by several food control groups without much consideration of how this standard originated, the types of organisms which it involves, and their significance. No consideration seems ever to have been given to the fact that the type of bacterium is fully as important, as the number present.

The so-called count standard (Breed³) which was first proposed by Sanborn was that paper-board to be used for paper milk containers should not contain over 500 bacteria per gm. This standard was lowered later to 250 per gm. as given in the *Standard Milk Ordinance and Code of the U. S. Public Health Service*. Previously, it was modified by adoption of a new culture medium which allowed about twice as many colonies to appear on plates made with disintegrated paper. The standard count was not changed. When it is remembered that these bacteria are harmless aerobic spore-bearing bacteria which have survived several treatments in the paper mill which have destroyed the species which are of sanitary significance in public health work, it is difficult to see what is accomplished by such standards. Furthermore, paper-board which contains them is paraffined at temperatures around 180° F. for 20 seconds.

Any bacteria which are present would be "sealed over" and could not reach the food which comes in contact with containers made from such water-proofed paper, even if they remained viable for any length of time. A plate count would be of sanitary significance only if it enumerated bacteria which caused disease or gave some information about procedures used in making a product. The count secured on finished

paper-board does not do this because no bacteria of sanitary significance are present. To offer an enumeration of harmless, relatively heat-resistance bacteria as having sanitary significance shows a distinct lack of appreciation of what sanitation really is.

Strange as it may seem, the severest criticisms of the plate count come from the two individuals, Breed and Sanborn,⁴ who proposed the "count standard" of not over 500 bacteria per gm. for paper-board to be used for paper milk containers. This publication completely discredits the count as a reliable guide because it is subject to too many errors. These are discussed at some length.

"It is unfortunate that there is no method whereby the true accuracy of the counts obtained from paper products by this technique can be determined. Even the most painstaking research, using refined methods, does not reveal the exact number of bacteria present in a gram of paper or paper-board, so that we can only guess whether the results obtained in routine analytical work are accurate counts."

About all that should be inferred from Breed and Sanborn's discussion is that plate counts on paper are subject to great error and should not be used as an index of anything. Such counts were said not to indicate dirt; dirt and bacteria were said to be two different things. In view of these comments, it is difficult to see what the plate count standard means or what good it does even to control officers.

Escherichia coli is conspicuous by its absence from paper. It has never been found on paper by the author nor in any samples taken in paper mills after the pulp has started its journey through them and has received the first treatments. As reported above, *Escherichia coli* is completely killed on the drying rolls of the papermaking machine even when strains with higher heat resistance than usual are used. Wheaton¹³ reported that at no time had he found *Escherichia coli* in samples of paper.

SUMMARY

1. Coliform bacteria are absent in the pulp stream in paper mills and in finished paper.

2. Bacteria are destroyed in paper mills by pulping under pressure with chemicals, bleaching with strong chlorine, and passage over drier rolls heated to high temperature.

3. Many species of bacteria die out in paper because of lack of moisture. Only aerobic spore-bearing bacteria survive.

4. A bacterial count standard such as has been proposed for finished paper is of no value for determining sanitary quality of paper.

THE MORNING AFTER

THE Seventy-sixth Annual Meeting of the American Public Health Association, held in Boston, November 8-12, is now a part of our history. It was the largest meeting in the three-quarters of a century of the Association, with a registration of over 4,200. The problems created by a convention of this size are serious. The housing of 400 participants, the provision of space for the exhibits and for simultaneous meeting places for a dozen different Sections, involve demands which can be met only by half-a-dozen cities in the United States. This makes impossible the wide geographical distribution of our Annual Conventions which was attainable in earlier and simpler days. Except for acoustical difficulties in certain of the meeting places, all of the problems involved were satisfactorily solved in Boston. Administrative arrangements were so excellent that everything moved smoothly, in a way which reflects great credit both on the Boston Local Committee, under the chairmanship of Dr. John H. Cauley, and on our own office staff. The generosity of our hosts in providing special entertainments for the Association and its officers broke all records.

In the field of Association business, the proposed constitutional amendment, which would have admitted members, as well as Fellows, to the franchise in voting for officers of the Association, was approved by a large majority but lacked seven votes of the two-thirds necessary for enactment. It is to be hoped that this amendment will be re-introduced next year and acted upon favorably. The Governing Council, by a large majority, approved the petition to establish a new Section on Medical Care, the thirteenth Section of our organization, and the first

new Section to be created since 1943. It will begin its existence with close to 500 members, a unique record.

Dr. Charles F. Wilinsky takes office as President, with recognition by the Association of his distinguished services to public health, and grateful appreciation of the major role he played in making the 76th Annual Meeting so pleasant and so profitable. Dr. Lowell J. Reed of Johns Hopkins was chosen as President-Elect, and Dr. Hugh R. Leavell of Harvard as Chairman of the Executive Board. The award of the Sedgwick Memorial Medal was made to Dr. Abel Wolman of Johns Hopkins (this was Johns Hopkins Day!)—the first engineer to receive this honor, in recognition of his technical achievements and his superb statesmanship. The Lasker Awards were—as usual—made with admirable discernment; to Selman A. Waksman, René J. Dubos and Vincent du Vigneaud, for distinguished scientific research, to Martha M. Eliot and Rollo E. Dyer for outstanding administrative achievement, and to The Department of Medicine and Surgery of the Veterans Administration (Paul R. Hawley and Paul P. Magnuson) for the remarkable reorganization of that department.

The central point about which the program was planned was the approximate centennial of Lemuel Shattuck's Report of the Massachusetts Sanitary Commission in 1850; and it is a source of gratification that a facsimile of this classic report was prepared for the occasion and may be obtained from the A.P.H.A. office. There were two trends which particularly impressed the writer in the program as a whole. One was emphasis on the vital problems of Administration, including recruitment, and qualifications of personnel, compensation, and inservice training and on the philosophy and techniques of health education. The other was a broadening vision of the scope of public health as evidenced by the interest of engineers in housing, of industrial hygienists in the health problems of the farm worker, of epidemiologists in accident prevention, of health officers in the administration of medical care programs. The fact that 22 out of a total of 48 technical meetings were joint sessions of different Sections illustrates this trend.

Finally, a word must be added in regard to one feature of our Annual Meetings (and of the functioning of the A.P.H.A. as a whole) which may have escaped the attention of the new members and may sometimes be forgotten by old members. This is the work of our Standing Committees on Administrative Practice, on Professional Education, and on Research and Standards. These committees held sessions at the Annual Meeting extending into the small hours of the morning; but the several hundreds of members of these committees and of their subcommittees are working 365 days of the year on their arduous and continuing tasks. To take one example, although a particularly shining one, think what we owe to Dr. Haven Emerson for the report on Local Health Units which is the solid base for our whole program for upbuilding the health machinery of these United States; and for the report on Communicable Diseases which is becoming the basis for standard practice all over the world. Consider our debt to the Committee on Research and Standards for standard methods for examination of water and milk and diagnostic procedures, to the Committee on Administrative Practice for the *Evaluation Schedule* and the whole program of local community surveys, to the Committee on Professional Education for its reports on qualifications of personnel, its Merit System program, its accreditation of schools of public health. The work of these Standing Committees is the life-blood of the Association; and to their

members—as well as to the members of the Section Councils who planned their sessions at Boston so well—we owe a deep debt of gratitude.

GUIDANCE FOR A PRE-ADOLESCENT WORLD

IT has become an obvious truism that the survival of modern society depends on narrowing the gap between the striding advance of physical science, and the deplorable lag in our understanding and our application of the principles of human motivation. As master of space and power, man has become a very Titan. As master of his own soul, he is immature—and, on the international scale, pre-adolescent.

The International Congress on Mental Health, held in London last August, was therefore an event of the greatest potential importance. Some 5,000 experts in sociology, psychology, psychiatry, anthropology, political science, philosophy, and theology, in twenty-seven countries were engaged in preliminary work on the report, finally crystallized by a small Preparatory Commission and adopted by the London Congress before its adjournment.¹

The fundamental basis of hope in this report is the proof which has come to us from modern psychology and psychiatry that human behavior is modifiable. "Men have long accepted the inevitability of recurring misfortunes in the shape of group conflict and war on the grounds that 'that is human nature.' This belief has even been used to maintain the existing state of affairs. When, however, social and psychiatric science had progressed sufficiently, a rigorous investigation of 'human nature' clearly revealed that these discouraging traditional views had no valid foundation. Possibly the most important contribution to human welfare which has come from studies by social scientists and psychiatrists has been the demonstration of how much human beings are the product of their upbringing."

On the other hand, the difficulties in the way are clearly recognized. The plasticity of human nature decreases with every passing year. The phases of infancy, of childhood, of adolescence, and "psychological weaning" are the periods in which personality is molded. Furthermore, the building of a healthy personality depends on far more than the work of the psychologist and psychiatrist. The parent, the employer, the social scientist, the economist, the lawyer, the politician, the administrator, the educator, the writer, the radio, the cinema, the church, all play their part in governing the course of character development. Note, too, that the objective is "character," not "conduct." Conduct may be controlled by force, as the dictators have demonstrated but "The application of principles of mental health demands that . . . human beings must not be induced to behave in particular ways by irresponsible manipulation of fear, guilt-feelings or prejudice."

Our objective must be "to discover ways of releasing human potentialities, individually and collectively, for the common good." And the "common good" must be visualized on a global scale, with a realization of the responsibilities of world citizenship involving loyalty to the whole of mankind. "Such new loyalty need not conflict but rather embraces traditional loyalties to family, community and nation, which alone are no longer sufficient for the protection of the interdependent peoples of the world." The concept of world citizenship is not used in any political sense of world supersovereignty. It involves merely acceptance of

the challenge of a "common humanity." "In one sense," the report reminds us, "the movement toward world citizenship is one which fulfils, rather than goes counter to the trend of history. Man's social history so far has usually limited his freedom for friendly coöperation by the degree of inclusiveness of the groups to which he has been permitted to give his loyalty. Thus in feudal times a man's loyalty was limited to his feudal lord, later to some regional principality, and later still to some larger political unit. At each step the smaller loyalty was taken up in the larger. It is possible to envisage a world community built on free consent and on the respect for individual and cultural differences."

The Report does not minimize the difficulties of the task. It reminds us that "Many people give up the struggle to participate actively in influencing public affairs of a political, social or economic nature, and seek escape either in civic apathy or in clinging to adolescent modes of thought; or they avoid insecurity by the espousing of some sheltering ideological movement.

"There are many other obstacles—the fatalistic belief, so widely held, that war is inevitable, and that nothing can be done about it; the exaggerated claims of the superiority of one's own national or racial group, with accompanying depreciation and contempt of others; the widespread manipulation of aggressive attitudes against 'out-groups' either within or outside the national community; the fears and doubts and uncertainties which lead people to seek in a strong national authority the security which they do not find in themselves; the sheer ignorance of the ways of life among other nations. There is no need to complete the list. It could be extended considerably."

To overcome such obstacles, the Report makes an urgent plea for research, not only in the study of the problems of mental health but in the broader fields of human personality, of social relationships and of social institutions. It outlines the general program of mental health services (hospitals for in-patient care, mental hygiene clinics for diagnosis and out-patient treatment, and child guidance centers for basic prevention) needed in every country; the principles which should govern such services; the problems of planning and administering them; and the role of education, of professional workers and the general public, essential for making such services operative. The report closes with a series of specific recommendations leading toward the goals outlined, which have been transmitted to the UN, the WHO, and the World Federation for Mental Health, which will carry on the work of the International Congress on a permanent basis.

The thoughtful reader must consider this Report with mixed feelings—with admiration, on the one hand, for its wisdom and soundness—but also with concern at the inevitable gap between present status and theoretical possibilities. The Report is absolutely right in ignoring easy and tempting short-cuts to perfection—in insisting on a basic approach and in anticipating results only on a basis of a long continued and widely based program which will have maximum effectiveness only when applied to the young and growing mind. On the other hand, the fate of the world will not be decided by a generation whose personalities have been strengthened and liberated by child guidance clinics. Man has largely conquered space and power. He has not conquered time; and time runs against us in this urgent hour. The Congress (perhaps for reasons of professional modesty) did not suggest that every national delegation to the United Nations should have a psychiatrist as its adviser. We venture to suggest that such a step would do more for us in 1949 than any of the specific recommendations made at London. Inter-

national delegations all have their political and legal and economic experts; but their task is basically and primarily a daring experiment in human behavior. Like any other scientific experiment, it requires expert judgment, not merely good intentions.

HEALTH PROBLEMS OF AN AGING POPULATION

IN 1900, there were eight causes of death in the United States which exhibited death rates above 50 per 100,000 population. Three of these (tuberculosis, pneumonia, and diarrhea and enteritis), which were the three top causes of death in 1900, have now dropped below the 50 mark. The other five showed, in 1946, the following mortality rates: diseases of the heart, 307; cancer, 130; accidents and violence, 88; cerebral hemorrhage, 78; and nephritis, 58. All of these are conditions associated with an aging population; for it must be remembered that the age curve for accidents is almost as closely related to age as is that for heart disease. In 1946, these five causes of death accounted for about two-thirds of the mortality from all causes, and at all ages.

Cancer was the first of the diseases of later life to find an important place in the official public health program. In 1898, the Legislature of New York State appropriated funds to be expended by the Medical School of the University of Buffalo for research in this disease. Massachusetts, however, was the first state (in 1919) to provide funds to its State Department of Health for study on the prevalence, prevention, and control of cancer. A. V. Deibert, in a recent review¹ reports that 12 states and the Island of Puerto Rico now have permanent cancer programs in their departments of health; and 8 other states and the District of Columbia have received special appropriations earmarked for cancer activities but without the basis of assured permanency. In the first group of states cited,* the general ideals set forth by the National Advisory Council are more or less adequately approached. These include (1) statistical research to determine the nature and extent of the cancer problem of the state and to evaluate the results of activities; (2) educational activities for the public and all professional groups concerned in the detection, diagnosis, and treatment of cancer; (3) activities to provide adequate detection, diagnostic and treatment facilities and services accessible to persons of all economic groups in all sections of the state, including facilities for care of the terminal case either at home or in an institution.

In connection with the other health problems of later life, progress has been much less rapid. In a few states, however, interest is definitely spreading to the broader problems of geriatrics. Massachusetts continues to turn out an inspiring series of studies, not only on cancer, but also on diabetes and other geriatric problems. *Health News*, the modern and up-to-date monthly bulletin of the New York State Department of Health, devotes its June, 1948, issue to an admirable presentation of "Problems of the Aged," in a popular and effective format.

* Alabama, Connecticut, Florida, Georgia, Illinois, Maine, Massachusetts, New York, North Carolina, Rhode Island, South Carolina, and West Virginia.

In Indiana, the State Board of Health has a Division of Adult Hygiene and Geriatrics. In 1946, in coöperation with the Indiana University School of Medicine, it held an Institute on Geriatrics at which such subjects as cardiovascular and renal diseases, arthritis, eye changes in advancing years, and mental hygiene in geriatrics, and geriatrics in industry were discussed.² It would be well for the rest of our state health departments and our larger city departments to follow closely the pioneer work of Dr. Getting and Dr. Hilleboe and Dr. Burney and their colleagues in this field.

LETTER TO THE EDITOR

TO THE EDITOR:

In reference to your article on the 150th Anniversary of the USPHS (38:1009, 1948) may I point out that the United States was not a pioneer in the field of treatment of seamen. In the 16th century Drake and Hawkins established the Chatham Chest, each "serving seaman" paying sixpence a month (multiply this by five to get the present prices). No distinction was made between Naval and Merchant Seamen at that time. The *Diary* of Mr. Pepys is full of his difficulties in "paying the Chest" as his colleague, Sir William Batten, had used the funds of the Chest as his own, and Pepys experienced great

difficulty in making him disgorge. The matter will be found in a condensed form in Arthur Bryant's *Samuel Pepys: The Man in the Making*.

Actually and realistically the Act signed in 1798 by President Madison was a subsidy for our embryonic Merchant Marine. My recollection is that there was first a "tonnage tax," paid by the ship-owners, and that the monthly assessments from the seamen came later. I recall that in my early years in the Service we occasionally encountered a seaman who had, in early life, had the deductions made from his wages.

J. D. REICHARD,
Medical Director, Retired, USPHS
Staten Island, N. Y.

BOOKS AND REPORTS

All reviews are prepared on invitation. Unsolicited reviews cannot be accepted.

Bergey's Manual of Determinative Bacteriology — By Robert S. Breed, E. G. D. Murray, and A. Parker Hitchens. (6th ed.) Baltimore: Williams & Wilkins, 1948. 1529 pp. Price, \$15.00.

A new edition of this classic standard reference work on bacterial taxonomy is especially welcome because it is 9 years since publication of the 5th edition. Rapidly expanding knowledge has led to many changes and the text has been completely revised by some 65 specialist contributors in consultation with the Editorial Board. A total of 1,630 species are described as compared to 1,335 in the preceding edition.

The classification used is a modification of that used in previous editions but remains essentially the same. However the number of orders in the Class *Schizomycetes* has been reduced from 7 to 5. The order *Caulobacteriales* becoming a sub-order of *Eubacteriales* and the order *Thiobacteriales* being divided by assigning the colorless, filamentous sulfur bacteria, *Beggiatoaceae* and *Achromatiaceae*, to the order *Chlamydo bacteriales*, and making the purple sulfur bacteria, *Rhodobacteriaceae* a part of the sub-order *Rhodobacteriineae* in the order *Eubacteriales*. The family *Corynebacteriaceae* has been transferred from the order *Actinomycetales* to the order *Eubacteriales*, and the genus *Eberthella* has been combined with the genus *Salmonella*.

Three groups of organisms whose relationships are considered to be obscure are treated in supplemental chapters which are new to this edition. The *Rickettsiales* are divided into 3 families, 10 genera and 37 recognized species, with an additional 91 species listed as

incompletely studied. The *Virales* (filterable viruses) are treated as an order consisting of 13 families, 32 genera and 248 species. The *Borrelomycetaceae* (pleuropneumonia group) are listed in 13 groups.

Public health workers should note that two important pathogens have been assigned new names. The meningococcus is now *Neisseria meningitidis* instead of *Neisseria intracellularis*, and the typhoid bacillus is now *Salmonella typhosa* instead of *Eberthella typhosa*.

Descriptions of organisms, their habitats, biochemical, cultural and serologic characteristics are complete and thorough as in previous editions, and the entire contents made more attractive by a new two column format. Interesting reviews of the history of bacteriological taxonomy and of the rules of nomenclature are given in the opening chapters, and the usual complete index of names of genera and species, including synonyms, with well over 10,000 entries, appears at the end of the book. A new index of sources and habitats of almost equal length has been developed and appears for the first time in this edition.

Every bacteriologist will need to refer to this *Manual* frequently. It should be in the library of every bacteriological and public health laboratory.

E. K. KLINE

Mental Deficiency—By A. F. Tredgold. (7th ed.) Baltimore: Williams & Wilkins, 1947. 518 pp. Price, \$7.50.

This work is commonly referred to as the "Bible" by workers in the field of mental deficiency. In the appropriateness of this allusion lies both the strength and the weakness of the work.

For comprehensive coverage of the field it has not been challenged by any other text in the English language since its original publication in 1908. And as a classic, it will doubtless continue for a long time to occupy an honored place on the shelves of all students of mental disorders, but possibly only as a classic. In several rather fundamental respects, especially with reference to advancing etiological and ontogenetic concepts, a much more thorough revision than the present will be required if its rôle as a repository of accruing knowledge or a guide to current thinking and progressive orientation in the field is to be maintained.

Classic texts however, continue to be of value in spite of specifically recognized shortcomings. The usefulness of Tredgold's clinical descriptions and aids to differential diagnoses will hardly be surpassed as long as the existing framework of classification remains in force. And his emphasis on the biological and social criteria of mental deficiency, rather than intelligence quotients, scholastic educability and outworn legal concepts, represents the only reasonable and just approach to modern social planning. For these and other virtues the book should be useful to all public health workers interested in these problems.

PAUL H. STEVENSON

The Care and Management of Laboratory Animals—Edited by Alstair N. Worden. Baltimore: Williams & Wilkins, 1947. 368 pp. Price, \$8.50.

This handbook, edited by A. N. Worden, Director of Research in Animal Health, University College of Wales, is intended as a practical introduction and guide to the husbandry and laboratory management and care of most of the small animals commonly used in the laboratory. Each of the 23 chapters (including a chapter for each of 19 different species of small animals, birds, amphibia, and fish) have been

drafted by individuals or groups of individuals (two chapters were written by people in the United States, including the Michigan department), or compiled from information furnished by outstanding authorities throughout several countries.

An impressive keynote throughout the entire book is the stress placed on humane use and handling of animals. The first chapter is devoted to laws and ethics governing the laboratory use of animals in Great Britain and other countries.

A complete and very detailed discussion is given of each of the various types of housing, cages and equipment, nutrition, breeding, handling and general management, anesthesia, euthanasia, and disease and its control for each of the many species included. While the extensive references include many American writers and two of the chapters are by American authors, the book is mainly composed by British authors and as a result of this there are some differences to be noted in their discussion of kinds and types of equipment and feeds used as compared to ours in this country.

As a whole the book will very well serve the purpose for which it was intended.

G. D. CUMMINGS

History of Factory and Mine Hygiene — By Ludwig Teleky. New York: Columbia University Press, 1948. 342 pp. Price, \$4.50.

To those who are actively engaged in the practice of industrial hygiene in the United States, this book will be highly valuable in providing a historical background for their present knowledge. Dr. Teleky has accomplished a monumental task in reading and abstracting an unbelievable number of references.

The material offered in this book is fairly well organized, considering its complexity and geographical distribution. It does not, however, present a true picture of the general status of

either industrial hygiene or industrial safety in this country. Admittedly, some conditions here in industry may not be quite as good as they should be, but they are certainly not as unsatisfactory as the uninformed reader might be led to believe from reading certain statements in this book.

The reviewer is also of the opinion that more credit might have been given deservedly to the industrial hygiene work done and being done by the many state and local health departments. Furthermore, hardly any mention was made of the contribution made by industrial hygiene engineers in the prevention of occupational diseases by effectuating improvements in the working environment. The foregoing is due, no doubt, to the author's limited experience in this field in this country.

The book provides otherwise good and informative material and should be a valuable addition to one's reference shelf.

H. G. DYKTOR

Industrial Air Sampling and Analysis. Chemistry and Toxicology Series; Bulletin No. 1, 1947—By Leslie Silverman. Pittsburgh, Pa.: Industrial Hygiene Foundation, 1947. 72 pp. Price, \$1.50.

This bulletin is the first of a new series of publications on chemistry and toxicology under the sponsorship of the Committee on Chemistry and Toxicology of the Industrial Hygiene Foundation. Methods of sampling workroom air to detect health hazards and impurities is presented by Dr. Silverman who is Assistant Professor of Industrial Hygiene at the Harvard School of Public Health, Boston, Mass. The volume divides methods of air sampling into those which may be taken instantaneously and those over a longer period. Included among the methods and techniques for analyzing contaminated atmospheres are test paper and flame test methods, physical

methods, dust determinations, mixtures of contaminants in air, flow measurements, the calibrations of sampling instruments, calculations in industrial air analyses, and routine sampling and recording of atmospheric impurities, together with references from the literature.

REGINALD M. ATWATER

Bacteriology and Immunology—[*Fiat Review of German Science 1939–1946*], Hans Schmidt (Senior Author). Published by Office of Military Government for Germany, Field Information Agencies Technical. Printed under the supervision of Dieterich'sche Verlagsbuchhandlung, Wiesbaden, 1947. 155 pp. Hygiene Part I. General Hygiene [Fiat Review of German Science 1939–1946], Ernst Rodenwaldt (Senior Author). Published by Office of Military Government for Germany, Field Information Agencies Technical. Printed under the supervision of Dieterich'sche Verlagsbuchhandlung, Wiesbaden, 1948. 191 pp.

The two volumes under review represent part of a project by Military Government of the American, British, and French zones in Germany to present a concise yet complete account of the investigations and studies made by German scientists in biology, chemistry, mathematics, medicine, physics, and the geological sciences from May, 1939, to May, 1946. Actually, collection of information of this kind had already been undertaken during the war, and the earlier reports have been made available by the Department of Commerce. These earlier efforts, however, were aimed rather at obtaining information which could help to bring about an earlier end to the war, and were therefore not systematic in character.

The more systematic character of these recent publications is evident at a glance. The volume on Hygiene, of which the first part is reviewed here,

consists of eleven sections: medical statistics; public health service, effect of atmospheric conditions on man, bioclimatology, geomedicine, water, sewage, housing, nutrition, milk, and meat products. Each of the contributors is competent, and some, like K. Imhoff, have world-wide reputations.

The volume on Bacteriology deals with bacterial antagonisms, counting methods, microbial metabolism, the various bacteria (salmonella group, coli, dysentery, streptococci, staphylococci, tetanus, gas oedema, anthrax, gonococcus, meningococcus), as well as animal toxins and helminths. There is a separate section on immunology.

In a brief review it is impossible to discuss the material contained in these volumes. Interested readers are referred to the originals (which are in German), and inquiries should be directed to the Office of Military Government for Germany (U. S.), Economics Division, Research Control Branch, Berlin, Germany. APO 742. U. S. Army.

GEORGE ROSEN

Psychiatry in a Troubled World—
By William C. Menninger. New York: Macmillan, 1948. 636 pp. Price, \$6.00.

In this volume, Dr. Menninger has drawn on his experience as Chief Consultant in Neuropsychiatry to the Surgeon General of the Army to present an analysis of the psychiatric problems faced in the last war, a record of the accomplishment in meeting these problems, and an indication of the implications of this analysis for future application within civilian as well as military social organization. The book has been exhaustively documented with data and references and as a result is extraordinarily valuable as a reference source for both historical and scientific purposes.

In undertaking this task, Dr. Menninger was faced with the problem of

showing the tremendous accomplishments of psychiatry in the face of almost impossible handicaps, yet doing this in such a realistic way as to indicate how little was done in comparison with what might have been accomplished had we heeded the lessons of the first world war, and been able to utilize to the fullest the advances in psychiatric knowledge since that time. The chief difficulties were the tremendous size of the army and the relatively small number of psychiatrists available to do the job. Also of prime importance was the organization of the army and the attitudes toward psychiatric patients on the part of officers, medical, as well as line officers.

This book is of immense importance to public health workers, not because of the brief chapter on public health activities in this field, but in the implications for a broad program of really preventive work. Dr. Menninger has made a dynamic evaluation of the army as a social institution and the effect the pressures and requirements of this social organization had on the mental health of the soldier. The evaluation of these pressures is of utmost importance for application to the problems of civilian life.

Dr. Menninger points out the importance of good leadership to the moral and mental health of the soldier. By presenting and evaluating his material so courageously, by his frank criticism of army organization and procedure, and by his appraisal of our most critical social problems, he continues his rôle of leadership so ably established during his war service.

JAMES M. CUNNINGHAM

Psychotherapy in Child Guidance
—By Gordon Hamilton. New York: Columbia University Press, 1947. 340 pp. Price, \$4.00.

Gordon Hamilton, Professor of Social Case Work, School of Social Work, Co-

lumbia University, formulates in this book the principles of psychotherapy as practised by the social worker at the Jewish Board of Guardians. While this study will be of most value to those working in child guidance clinics or social case work agencies, certain sections of the book can assist public health workers in adding to their understanding of children's personality difficulties. Chapters III, IV, and V are devoted to a discussion of children who present different symptoms; Chapter III—The Child Who Acts Out His Impulses, Chapter IV—The Anxious Child, Chapter V—The Severely Disturbed Child. The chapters on the diagnostic process and treatment will give a detailed picture of what happens in "psychotherapy" of the child.

Chapter XI—Treatment of the Family, stresses basic attitudes toward the family, which are essential on the part of those with therapeutic intent toward the child. The reviewer is of the opinion that this chapter of itself can be especially valuable to workers in maternal and child health programs. While the practice in this particular agency is somewhat unique in the amount of therapeutic responsibility assumed by the social worker, it nevertheless indicates a growing tendency for "psychotherapy" to be undertaken by others than the psychiatrist, providing such workers secure suitable psychiatric supervision and consultation.

The many case studies cited in this book will give better understanding of etiological factors in children's difficulties, with the result that public health workers may be impressed again with their contribution to the overall health of the child.

MARTHA W. MACDONALD

Disability Evaluation—By Earl D. McBride. (4th ed.) Philadelphia: Lippincott, 1948. 667 pp. Price, \$12.00.

This is the fourth edition of a publi-

cation which has now become one of the standard texts in the field of disability evaluation. In this very important medicolegal field, Dr. McBride has furnished the physician with special techniques and guidance in aiding him in evaluating the end results of accidental injuries occurring in the course of employment.

The book is profusely illustrated with graphic figures which help to explain the medical procedures involved. Additional case illustrations, particularly in the field of treatment, add to the value of the book.

While there is no one system which can be accepted as authoritative in the field of disability evaluation, McBride's technical material, nevertheless, forms the basis of that clinical judgment which in the last analysis is the proper function and responsibility of the treating physician.

HENRY H. KESSLER

The Maryland Medical Care Program—By Howard M. Kline, Milton Terris, Cozette Hapney, and Nathan A. Kramer. *A Report by the Staff of the Subcommittee on Medical Care, Committee on Administrative Practice, American Public Health Association*, 1948. 151 pp.

This excellent report deals with one of the studies undertaken by the staff of the Subcommittee on Medical Care of the Association's Committee on Administrative Practice. Such studies may serve as a basis for expansion of the general specifications for a national health program laid down by the Association in 1944.

Maryland's program of medical and related services for public assistance recipients and the medically indigent has the distinction of being the first such state-wide program administered by a state health department and local public health units. It is thus of great significance at a time when public health

must fulfil its destiny of meeting the total challenge of the people's health. This report is a must for public health administrators and recommended reading for health and welfare workers generally.

The scope of this thorough study is impressive. A revealing historical background is presented and the report then deals in detail with the organization of the program and an analysis of services and expenditures. Helpful summaries of discussions are given throughout and the report is rounded out with a useful "Summary and Conclusions" chapter. Numerous tables and charts are included and several key documents and forms comprise the appendix.

Will the medical profession cooperate in developing a medical care program for disadvantaged people in their state? To what extent does their interest go beyond monetary considerations? How smoothly can a transfer of health functions from the welfare to the health agency be effected? Does a considerable degree of decentralization of policy formulation and administration have its serious drawbacks as well as clear advantages? Does experience prove that advisory groups should include representatives of the affected public? Does coordination of public health and medical care "come naturally," or must the merger be nurtured? The reader will draw his own conclusions from the facts and the unobtrusive comments of the writers.

Maryland's pioneering program already offers a wealth of experience to the health officer who wishes to be prepared to deal with medical fees and bills, duplicate prescriptions, authorizations for dentures, and the delicate relationships to be maintained in his area. The program itself, developed cautiously and handicapped by budgetary limitations, appears to be well rooted and to hold promise for the future. One would hesitate to predict the early fulfillment

of that promise in terms of comprehensive services for all medically needy residents of Maryland in the absence of integration in an overall health insurance program with contributory as well as general revenue financing.

F. D. MOTT

Tuberculosis Reference Statistical Year Book 1946—*By New York Tuberculosis and Health Association, 1947. 14 pp. Free.*

This annual statistical compilation by the New York Tuberculosis and Health Association has been long regarded as the outstanding publication of its kind in the United States. It is unique not only in so far as its completeness is concerned, but primarily because it has virtually set the standard for health organizations in other large cities.

For the most part the contents are concerned with mortality and morbidity statistics as applied to New York City and the usual breakdown thereof. In addition, the leading causes of death, clinic services, sanatoria, and hospital services are dealt with at length.

For purposes of comparison the author has wisely included similar statistics from 50 other large cities, thus enabling the reader to obtain at a glance an overall picture of the tuberculosis problem in the leading cities of the United States.

New York City presents an unusual opportunity for the study of tuberculosis. Besides having the distinction of being the largest city in the United States, it is likewise the most congested and populous urban aggregation in the world. The barometer of progress against tuberculosis as portrayed in this publication by Drolet and his associates indicates quite clearly, however, that despite the magnitude of the problem, the medical and health professions are making decided progress in effectively controlling the spread of the disease.

This is an unusual publication. The

reviewer regards it as "must" reading for every tuberculosis worker in any of the large cities of the United States. For the student of public health and hospital administration it comprises a veritable encyclopedia of well organized information pertaining to tuberculosis in urban areas.

EARL E. KLEINSCHMIDT

Synopsis of Pediatrics—By *John Zahorsky*. (5th ed.) St. Louis: Mosby, 1948. 449 pp. Price, \$5.50.

This compact volume of over 400 pages touches briefly on all aspects of pediatrics. It gives significant facts about serious illnesses and disorders in children; it offers the latest information on methods of treatment. It contains valuable factual information, excellent pictures, and diagrams. Many aspects of diagnosis which are of interest to pediatricians have been omitted, but as this is a synopsis, it cannot be expected to include all diagnostic points. As the subject of management of well children is an important aspect of pediatric practice, more references on this subject would seem to be indicated.

This volume should be very helpful as a reference to general practitioners, to health workers, and to other persons whose occupation brings them in contact with sick children.

MARTHA L. CLIFFORD

Smoke—The Problem of Coal and the Atmosphere—By *Arnold Marsh*. Cleveland, Ohio: The Sherwood Press, 1948. 306 pp. Price, \$7.00.

The author of this well written book is general secretary of the National Smoke Abatement Society of Great Britain and thus is in a position to make out a strong case for smoke control. This he does in meticulous fashion, marshaling his facts at considerable length.

His book is intended primarily for Britons and he writes mostly of British experiences. His references are almost

exclusively British, with an occasional reference to isolated American situations. Part of the Appendix is given over to a discussion of the smoke problem in countries other than Great Britain, including a few complimentary remarks for efforts in some American cities.

The first half of the book presents the problem of smoke—its history, nature, health significance, effect on plant life, destruction of property, relation to squalor and uncleanness and its cost. There is a short discussion of the related problems of sulfur compounds and of fly-ash.

The second half sets out the control methods which have been devised, with a discussion of their relative effectiveness and limitations. The author states that the prevention of smoke depends on "three principal factors: (1) the nature of the fuel; (2) the appliance in which it is burned; (3) the way in which it is burned." While one may disagree with his statement that only the first of these is involved in the domestic heating appliance, one should agree emphatically with his plea for smoke prevention rather than smoke abatement.

Mr. Marsh proposes a plan for action in which restrictions on the use of bituminous coal are progressively applied. In this he leans heavily on the experience of St. Louis. One should point out an over-emphasis of the health significance and of some other effects of smoke which is apparently in compensation for the author's admission of the overwhelming difficulty of national smoke control.

This is an excellent book for the municipal health official's library. Many of the answers to questions which his public may get around to asking him are found there. Also, there is much factual information for his use, should he want to organize public opinion to support an effective smoke control program.

JOHN BUXELL

Psychotherapy, Its Uses and Limitations—By D. R. Allison and R. G. Gordon. New York: Oxford University Press, 1948. 156 pp. Price, \$3.00.

The sub-title of this concise, pocket-sized book warns the reader against expecting a systematic treatment of the principles of psychotherapy as such, or a simplified initiation into the mysteries or techniques thereof. On the other hand, it serves to flag the attention of a widening circle of public health workers interested in keeping intelligently informed of the tangible results of specialized activities in this important sector of medical progress.

In the preface and first chapter the authors give a summary background to the development of psychotherapy. Serially in the following chapters are reviews of the different types of illnesses now commonly recognized as presenting significant psychological facets amenable to psychotherapeutic approach. Problems of differential diagnosis and of the limitations imposed by recognizable constitutional psychological deficits are appropriately considered. The point being emphasized that, in view of the scarcity of competent psychotherapists, important as it is to know when psychotherapy is indicated, it is equally important to recognize situations in which it is useless, where its practice is apt to be at the expense of others on whom effort can be more profitably expended.

The closing note is a plea for a combined approach to the total problem of psychotherapy. In addition to the increasing curricular attention being given to psychosomatic and psychosocial concepts in the field of medical education, there is found also today an increasing appreciation of the relevant contributions to be made by clinical psychology, philosophy, and religion. Accordingly, the authors' final words are ". . . the team's the thing; let us get together in a combined approach, with one object and

one object only in view, the material and spiritual welfare of the whole human race; and where necessary because illness has already intervened, the rehabilitation of the individual patient in relation to the world around him."

PAUL H. STEVENSON

Food Products—By Saul Blumenthal. New York: Chemical Publishing Co., 1947. 986 pp. Price, \$12.00.

The author states in the preface that the book was written for "Everybody interested in the preparation of food from the manufacturing plant executive, the food chemist and the food salesman, right down to the housewife." That is, the book is too popular in places and in others mildly technical. For example, on page 813, one reads, "Bacteria have no legs, fins, or wings." Numerous statements are made which may mislead the lay reader; others are partially in error. Thus, on page 811 occurs the statement "Foods which have been allowed to stand for some time after cooking, particularly if they are not cooled and kept refrigerated, are likely to cause food infections. The introduction of harmful bacteria which cause epidemics of disease, as well as those which cause food spoilage and waste, occurs in practically the same manner." The book is not particularly useful to the public health worker except in so far as he may acquaint himself with manufacturing procedures and type formulas for many prepared and processed foods. In some respects the book is not well balanced. As an example, 10 pages are devoted to frozen foods and 87 to dehydrated foods. A vast field of subject matter is covered in this book—candies, cereals, dairy products, spices, dessert powders, sauces, fish and meat products, syrups and beverages, canned, frozen and dehydrated foods, jellies, plant sanitation, and food composition. There are no photographs.

CARL R. FELLERS

Recent Advances in Public Health
—By J. L. Burn. London, Eng.: J. & A. Churchill, Ltd., 1947. 409 pp. Price, 25/s.

This interesting book by an English health officer has 37 chapters and is divided into 3 major parts dealing with the relationships of public health to the individual, the community, and the environment.

From the title of the book this reviewer expected to find a broad discussion of the most significant developments and sweeping advances in the field of public health, with perhaps an indication of the most likely developments of the future. Instead, the book deals with a very great variety of public health practices, some new and some old, but most of which are distinctly of interest to anyone concerned with public health.

Although the book deals mostly with activities of the English health officer, frequent allusion is made to public health practice in America. The administration of nitrous oxide and air by midwives trained in the use of a portable apparatus; school tests for color vision; municipal foot-health services; mobile obstetrical services; hostels for the retraining of neglectful mothers, while children are temporarily removed to nurseries; rural epidemiology and the possibility of research by amateurs strategically located in rural communities; the Garchey system of refuse disposal; cremation as a social service under the auspices of the public health officer; the growth of garden cities, and the Peckham experiment are some of the discussions on English practices which are probably less common or non-existent in American public health experience.

There is much valuable material in this book; it is well written and can be recommended as good reading, despite the fact that many of the practices enumerated as recent advances in pub-

lic health would probably not be accepted as such in this country—and the Oslo Breakfast is hardly to be accepted as a recent advance in public health unless we adopt the longer view of current events.

OLIVER E. BYRD

Your Skin and Its Care—By Howard T. Behrman and Oscar L. Levin. New York: Emerson Books, 1948. 255 pp. Price, \$2.50.

This is another book apparently designed for those readers with curiosity about disease, health, and beauty. As public health educators we hope to find this type of book in a form that such readers may learn all they need for sound health education in a particular field. Books of this sort usually fall short on the difficult problem of teaching the reader to use medical service effectively. This is no exception, although the attempt is made to give medical guidance for the victims of over fifty varieties of skin disorders.

The explanations to indicate the possibilities of medical treatment are rather confusing, and do not give the patient sufficient interpretation to understand the ways that he is likely to fail to do his part for adequate diagnosis and treatment. We do not find enough of the how and why of coöperation with the physician. The implication of an unwarranted degree of certainty in our knowledge of "constitution," "internal deficiencies," "systemic disturbances," and "endocrine disorders" in relation to skin condition adds neither interest nor medical background.

However, it does very well in offering an understanding of the skin and how it functions. It meets a need for advice on the daily care of the skin and the use of cosmetics, soap and water. The dangers of self treatment and of the salesmanship of beauticians and so-called skin experts are well handled.

HAROLD H. MITCHELL

A SELECTED PUBLIC HEALTH BIBLIOGRAPHY WITH ANNOTATIONS

RAYMOND S. PATTERSON, PH.D.

Pandemics Every Thirty Years?—Difficult to imagine would be a more dramatic graph than this curve of influenza-pneumonia deaths, plotted since the pandemic of thirty years ago. First the curative sera helped, then ten years ago the sulfa drugs sharpened the drop. Now, with penicillin added, the improvement in mortality has been three times as great as in the preceding decade.

ANON. Influenza and Pneumonia—Thirty Years after the Pandemic. *Stat. Bull. (Met. Life Ins. Co.)* 29, 9:8 (Sept.), 1948.

Streptomycin—Official—In the nature of a second annual progress report, this paper covers 2,780 patients with all the tuberculous ills that human flesh is heir to. Judgment concerning the value of streptomycin in the treatment of the various manifestations of TB is strengthened rather than altered. Streptomycin therapy is still held to be a useful adjuvant to other forms of therapy, and occasionally the drug becomes definitive therapy in itself.

ANON. Streptomycin in the Treatment of Tuberculosis. *J.A.M.A.* 138, 8:584 (Oct. 23), 1948.

Apparent, Not Real—Though recognized polio has become less frequent in early childhood, there is no evidence to indicate that the disease is more common in adults. There has been only a proportionate increase in the older ages.

DAUER, C. C. Trends in Age Distribution of Poliomyelitis in the United States. *Am. J. Hyg.* 48, 2:133 (Sept.), 1948.

Unrealized Productive Years—Questioning the adequacy of crude numbers of deaths as the sole measure of

the relative importance of the various causes, these two men have developed new measures for ranking causes of death, that take into consideration the age at death as well as the number of deaths. They call the measure "life years lost" and "working years lost." If that idea doesn't intrigue you, I wonder what will.

DICKINSON, F. G., and WELKER, E. L. What Is the Leading Cause of Death? *J.A.M.A.* 138, 7:528 (Oct. 16), 1948.

Epoch Making—Every health library, personal or agency, should have this account of the organization of the current program of WHO. For the first time, a single health organization broad in scope and world-wide in representation is established.

DOULL, J. A., and KRAMER, M. The First World Health Assembly. *Pub. Health Rep.* 63, 43:1379 (Oct. 22), 1948.

Yes, and No—These four papers constitute a sort of second-thought in the matter of controlling air-borne respiratory infections by ultra-violet radiation. Earlier and enthusiastic findings are cooled somewhat. Though the air-borne route was only partially blocked, the researchers conclude that their findings suggest that improved methods may yet be found effective.

DU BUY, H. G., *et al.* An Evaluation of Ultraviolet Radiation of Sleeping Quarters as Supplement of Accepted Methods of Disease Control (and three related papers). *Am. J. Hyg.* 48, 2:207 (Sept.), 1948.

Anent Keeping New-borns with Their Mothers—Rooming-in confers advantages alike on the baby, the mother, and the lying-in hospital, assert these two reviewers, who predict that

the method will receive more serious consideration in the future.

FIELDS, H., and ROSE, E. K. "Rooming-In". *Am. J. M. Sc.* 215, 6:710 (June), 1948.

With Good Care—Premies, too, seem to do pretty well on a semi "self-demand" feeding schedule. There were emotional and administrative advantages.

GLASER, K. Semi-Self-Demand Feeding Schedule for Prematurely Born Infants. *Am. J. Dis. Child.* 75, 3:309 (Mar.), 1948.

Learning by Doing—Five essential steps through which all productive teaching proceeds are set forth for the benefit of dietitians. The very same steps apply to your health educational goals whatever may be the label by which your job is known. Recommended reading for all.

HOULE, C. O. The Dietitian as a Teacher of Adults. *J. Am. Dietet. A.* 24, 10:837 (Oct.), 1948.

The Answer is NO—It says here, "From the data presented, there is reason to believe that since the introduction of insulin the 'true' diabetes mortality trend has been downward rather than upward as shown by official statistics." Having been about drowned in "hot water" resulting from an attempt to annotate an earlier statistical item, I am resolved to stay dry and cool, though the temptation to comment on this one is strong.

MORIYAMA, I. M. Is Diabetes Mortality Increasing? *Pub. Health Rep.* 63, 41:1334 (Oct. 8), 1948.

Food for Administrator's Thoughts—Health department food control has passed far beyond condemning spoiled meat and inspecting restaurants. Now it's a matter of guarding the public against the machinations of the light-fingered fringe of the food producers, processors, and distributors.

RILEY, R. H. The Health Department and the Food of the People. *J.A.M.A.* 138, 5:333 (Oct. 2), 1948.

After the Chest X-ray—Early returns from a community-wide tuberculosis survey in Minneapolis reveal both the feasibility and the worth of a complete diagnostic procedure. The proportion of previously unrecognized cases among the suspects was huge, and not one in ten of the active cases was previously known to the health department.

ROEMMICH, W., *et al.* Preliminary Report on a Community-Wide Chest X-ray Survey at Minneapolis, Minnesota. *Pub. Health Rep.* 63, 40:1285 (Oct. 1), 1948.

Objective Leadership Needed—Proposing a permanent national advisory and planning council on health, including representatives of the A.M.A., the A.P.H.A., and other organizations competent to deal with medicine and public health, to concern itself with long-term planning of research and program.

SIMMONS, J. S. The Challenge of Preventive Medicine. *Ann. Int. Med.* 29, 1:118 (July), 1948.

Now You Know It Is So—Fly breeding can be controlled by insecticides and by eliminating breeding places, and fly control will reduce *Shigella* and (to a lesser extent) *Salmonella* caused diarrheal diseases. You've always assumed these statements were true: here is your evidence.

WATT, J., and LINDSAY, D. R. Diarrheal Disease Control Studies. *Pub. Health Rep.* 63, 41:1319 (Oct. 8), 1948.

Lethal Agent—A medical push is added to the pressure being exerted to induce automotive engineers to redesign cars for safety rather than speed and snappy appearance. There is much that could be done to make automobiles reasonably safe conveyances rather than death traps. As accidental deaths creep nearer and nearer the top of the

ten commonest causes, health authorities, too, may in time take a hand in this life-saving pressure.

WOODWARD, F. D. Medical Criticism of Modern Automotive Engineering. J.A.M.A. 138, 9:627 (Oct. 30), 1948.

Note of Caution—Just in case you may be tempted to equip yourself with

fibrous glass-lined outer garments, you'd better read this item. The researcher was not able to confirm the claims that this insulating material offers warmth without weight.

YAGLOU, C. P. Thermal Insulation and Comfort Characteristics of Fibrous Glass-Lined Garments. J. Indust. Hyg. & Toxicol. 30, 5:312 (Sept.), 1948.

Public Health in Foreign Periodicals

GEORGE ROSEN, M.D., PH.D.

FRENCH COLONIAL MEDICINE

The currently best selling novel, *The Plague (La Peste)*,¹ by Albert Camus is not only an admirable literary creation, but also an effective reminder of the medical problems faced by the French in their overseas possessions, and of their efforts to solve them. French achievements in the field of colonial medicine may be judged by the fact that among those who have participated in this work are such outstanding scientists as Alphonse Laveran, Albert Calmette, A. Yersin, Charles Nicolle, and Edmond Sergent.

In January, 1890, at the request of Pasteur, Albert Calmette was sent to Saigon in Cochin China to organize the first microbiological laboratory in a French colony. Several years later, in 1896, Emile Marchoux founded the first African laboratory at Saint-Louis du Sénégal. Subsequently, such laboratories were established in most of the French colonies. Some of these were branches of the Pasteur Institute at Paris. Among them may be mentioned the Pasteur Institutes at Saigon, Brazzaville, Hanoi, Dakar, and Tananarive. These establishments were founded to investigate and to find means for controlling the endemic and epidemic diseases that hindered the development of the particular regions. Three recent publications offer an illuminating review of some of these activities in French West Africa and in North Africa.

In a comprehensive survey entitled *L'Oeuvre des Pasteuriens en Afrique Noire, Afrique Occidentale Française*,² Constant Mathis deals with the work of the Pasteur institutes at Dakar and

Kindia in French West Africa, as well as with subsidiary establishments in the French Sudan, the Ivory Coast, and Dahomey. Mathis devotes the first part of his survey to biographical sketches of the various medical men who applied the methods of modern medicine to the control of disease in these French possessions. The second part of his account deals with the specific disease problems of the separate territories that make up French West Africa. Among the more important diseases of man that have required attention are malaria, sleeping sickness, amebiasis, leishmaniasis, plague, spirochetoses, tuberculosis, leprosy, cholera, yellow fever, dengue, murine typhus, ankylostomiasis, filariasis and rabies. In addition, the Pasteur Institute at Kindia deals with veterinary pathology, particularly with animal trypanosomiasis, piroplasmosis, anthrax, spirochetosis of horses, bovine and equine plague, tuberculosis, and peripneumonia. It is impossible to summarize the many detailed studies and the interested reader is referred to the original.

It is worth noting that these colonial investigators were almost all students of Félix Mesnil, the *Altmeister* of protozoölogy. Mesnil, a zoölogist by training, came to the Pasteur Institute at Paris in 1892, and in 1897 Laveran chose him as a collaborator. He thus provided a link between the heroic age of microbiology (Pasteur, Laveran, Roux) and the present. Edmond Sergent recently published an interesting appreciation of Félix Mesnil and his work.³

From March 23 to 26, 1948, the Institut d'Hygiène et de Médecine

d'Ostre-Mer de l'Afrique du Nord, which is in Algiers, celebrated the twenty-fifth anniversary of its foundation.⁴ On this occasion various aspects of public health work in Algiers were reviewed. The programs for the control of syphilis and tuberculosis, blood bank organization, and the prevention of blindness in Algiers were all discussed. In addition, papers were presented on the incidence of cancer in the French overseas possessions, health education in Algeria, and on occupational hygiene among Moslem artisans.

HISTORY OF AN ALGERIAN MARSH

In the course of the anniversary celebration, the visitors were shown a project of particular interest. This was the former marsh of Ouled Mendil, where the Pasteur Institute of Algiers had carried out a first class antimalarial program, as a result of which it had been possible to settle and to make available for cultivation an area of 300 hectares, that had previously been deserted because of the ravages of malaria. The brothers Sergeant who carried out this program have recently presented their experiences in a volume entitled *Histoire d'un Marais algérien* (History of an Algerian marsh).⁵

The vector in the Ouled Mendil area was *A. maculipennis* var. *labranchiae*, one of the most formidable anophelines in the Mediterranean region. Mosquito suppression was accomplished principally by applying a kind of natural process of filling in the land (*colmatage* in French). The torrential streams that pour down from the Sahel hills during the rainy season carry earth and sand. By gathering the water in a series of rectangular basins where it could be held, the earth and sand settled out. The water was then decanted. As these basins were situated in the lowest portions of the marsh, it was possible to build up the land at these points so that the water could no longer stagnate

there. At the same time, drainage was carried on through 42 kilometers of drains, ditches, and irrigation canals. Where it was impossible completely to suppress the water by means of basins or drains, *Gambusia holbrooki* was introduced into the water to devour the larvae. In the low-lying areas which were most difficult to drain, 45,000 trees, chiefly *Eucalyptus algeriensis*, were planted. The Sergeants speak of these trees as living pumps.

This undertaking was begun in 1927 and completed in 1936. The marsh, which in 1926 was still figured on the map of the area put out by the geographical service of the French Army, was missing on the map issued in 1936.

The splenic index of the inhabitants was 53 per cent before the antimalarial campaign was begun. After systematic medication of the population with quinine, the index dropped to 6 per cent in a few years.

Mosquito suppression and treatment of the human reservoir made it possible to undertake cultivation of this vast unproductive terrain. Two experimental farms were set up and five wells were dug. In 1946, for the feeding of laboratory animals, there were sown on this land 163 hectares of cereals and 40 hectares of fodder (lucerne, vetch and oats, clover, maize).

Finally, the authors point out that none of the pioneers who cleared and drained the marsh, and who began to cultivate it ever had malaria. There were 46 Europeans who lived on the two farms continually, and who were susceptible to the disease. Furthermore, none of the native workers were ever absent because of malarial fever.

There is no doubt that the history of this Algerian marsh is of considerable interest to anyone interested in the malaria problem. It is well written and belongs on the same shelf as Hackett's *Malaria in Europe*.

DDT AND CATTLE TICKS

Edmond Sergent has recently carried out experiments in the field to determine whether DDT is effective against cattle ticks.⁶ It was tested against all stages of the ticks (larval, nymphal, and adult) and was found to exert no preventive action, that is, it did not prevent the ticks from attaching themselves and feeding on the cattle. Nor did DDT exhibit any curative action, that is, ticks already attached did not detach themselves.

ABSENCE OF POST-VACCINAL
ENCEPHALITIS IN ALGERIA

In a brief note, Edmond Sergent points out that in the course of twenty-eight years (1910–1937) the Pasteur Institute of Algeria has produced more than 50 million doses of smallpox vaccine, without a single case of post-vaccinal encephalitis being reported.⁷

TOUAT — A STUDY IN MEDICAL
GEOGRAPHY

After two years spent at Touat in the Sahara as physician to the native population, P. Devors has collected all his observations on the geography, history, sociology, and medicine of this region in the form of a brief monograph.⁸ According to this author certain diseases such as plague, rabies, and tetanus are absolutely unknown in Touat. On the other hand, the venereal diseases and trachoma are extremely widespread. Diabetes has never been observed among the inhabitants of Touat, and there appears to be an almost complete absence of acute abdominal syndromes. Malaria is present, but the endemicity is not high. Occasionally epidemic outbreaks occur. Typhus fever had not occurred before 1941, and its appearance coincided with the epidemic that ravaged North Africa. No authentic case of typhoid fever has ever been reported. Ascariasis is extremely common and has been observed in 70

per cent of the population. It is a frequent cause of intestinal troubles.

All in all, this monograph is worthy of attention as a type of medical literature—the medical topography—which was very common in the 18th and 19th centuries but appears only infrequently at present.

CANCER IN FRENCH WEST AFRICA
FROM 1940 TO 1946

Within recent years French public health programs in the overseas possessions have broadened just as in other parts of the world. One of the problems to which attention has turned is cancer.⁹ Denoix presents a brief analysis of the incidence of cancer during the past six years in French West Africa. This is based on a system of reporting by which identifying data, history and pathological nature of the neoplasm are entered by the doctor on a special card. The card accompanied by any biopsy or autopsy material is then sent to the local pathological laboratory where the histological diagnosis is added. Then the card is forwarded in duplicate to the National Institute of Hygiene in Paris. Where no histological material accompanies the card, it is sent directly to the Institute. On the basis of the material collected in this way it was found that 35 per cent of all the recorded cases were due to cancer of the liver. For comparative purposes it is noted that in Parisians the incidence is 4 per cent. Other striking facts noted are the relatively large number of sarcomata, and the frequency of epithelioma of the leg.

CANCER IN SOUTHERN ALGERIA AND
THE SAHARA

Montpellier and Montpellier review the literature on the incidence of cancer in Southern Algeria and the Sahara.¹⁰ From the available data they conclude that cancer is apparently rare, yet they also raise the question whether this is

really the case. Of the 118 cases reported, 84 were epitheliomas and 32 sarcomas. One of the striking findings is the high incidence of cancer of the skin. One of the sources of error is the fact that it is difficult to obtain data on neoplasms of the female genital organs.

BIRTH WEIGHTS AND GROWTH OF NATIVE INFANTS IN THE FRENCH SUDAN

Public health authorities are also concerned about improving infant health. Canivet reports on a study during 1943-1945 of the weight at birth and the rate of growth of Sudanese infants as compared with those in France.¹¹ There were 17,504 Sudanese infants and the average birth weight was found to be 2,823 grams, more than 400 grams less than that of French white infants. First born infants are between 300 and 400 grams lighter in weight than those born subsequently. Two factors are held to account for these findings. In the first place native mothers are extremely young; secondly, the period of suckling lasts for 18 months to two years, and during this period the woman remains apart from her husband. Consequently there is a period of two to three years between the birth of the child and that of the second. Another extremely important factor is the hard physical work and poor diet that the Sudanese mother must endure especially during the period from September to November when it is necessary to work in the fields and food is scarce. In contradistinction to the regulated mode of feeding prevalent in France, the Sudanese infant is suckled by an undernourished mother in a completely irregular fashion. The only supplementary feeding is adult food previously masticated by the mother. This is reflected in the fact that while the rate of growth of the Sudanese infant is more rapid at first, it slows down after the fourth month.

This study contains a number of interesting comparisons and deserves close reading.

ANOPHELINES, MALARIA AND ALTITUDES IN CENTRAL AFRICA

Schwetz points out that his observations on the absence of anopheline vectors of malaria (*A. gambiae*) and of autochthonous malaria at altitudes of 2,000 meters were confirmed in Abyssinia by Castelli, Corradetti, and by Lega, Raffaele, and Canalis.¹² He attributes the small outbreak of malaria observed by Garnham in Kenya at an altitude of 2,800 meters to the introduction of *A. gambiae* from a lower neighboring area. Finally he adds that the only other report, that of Martin, claiming the existence of apparently autochthonous cases of malaria at Addis Ababa ought to be reexamined.

THE LASKER AWARDS FOR 1948

THE Lasker Awards of the American Public Health Association are presented annually by the Albert and Mary Lasker Foundation to men and women in the field of medical research and public health administration whose efforts have contributed to, or will in time result in, the vastly improved health status of the peoples of the earth. In addition, outstanding work or research done by large groups where it is impossible to single out any one individual, is honored.

The awards are given not only to honor the recipients and dramatize their accomplishments but also to arouse increased professional and public interest in medical research and public health administration and to aid in the rapid dissemination of new medical information.

The Lasker Awards for 1948 were conferred on November 11, 1948, at the Second General Session of the 76th Annual Meeting in Boston, Mass. Five individuals and one group were honored. The beautifully illuminated citations read as follows:

To Professor Vincent du Vigneaud, for his outstanding and basic studies of transmethylation, including the concept that methyl groups are essential in animal nutrition; and for contributions to the chemistry of biotin and penicillin

Professor Vincent du Vigneaud has contributed richly to progress in the science of biological chemistry. Out of his early interest in the structure and metabolism of sulfur compounds, arose a new concept in regard to the essential role of methyl groups and amino acids in animal nutrition. These discoveries have been especially fruitful in regard to understanding the functions of the liver and kidneys, but they have no such limitation—they have given many new windows through

which the chemist, the biologist, and the physician can visualize changes that characterize all living cells.

In the field of vitamins, Dr. du Vigneaud's accomplishments, in collaboration with his associates, have included extensive structural and functional studies of vitamin H, or biotin. Following the isolation of biotin, its detailed structure was established by their work and the assigned formula was confirmed by synthesis in independent laboratories.

During the war years, Dr. du Vigneaud worked intensively on the chemistry of the critically needed antibiotic, penicillin. This work culminated in the creation of a synthetic product and proof of its identity with natural penicillin.

Few men are privileged to make so many basic discoveries and to establish experimental findings so clearly. Dr. du Vigneaud's achievements in biological chemistry have had, and will continue to have, an extraordinary influence upon scientific research in many laboratories throughout the world. In addition, a record of his contributions should include reference to his rare gift of friendship, his training of outstanding young biochemists, and his skill as a lecturer.

Because he has advanced the frontiers of our knowledge of fundamental living processes, the American Public Health Association is honored to present to him a Lasker Award for 1948.

To R. E. Dyer, M.D., for his outstanding administrative achievement in the organization and administration of the Research Grants Division of the National Institute of Health of the U. S. Public Health Service.

The Lasker Awards of the American Public Health Association are made in recognition of outstanding scientific or administrative achievements in medicine and public health. In recommending an award in 1948 to Dr. R. Eugene Dyer, the Association has the unusual privilege of honoring him in a dual capacity, for his scientific accomplishments in the field of microbiological research and for the administration of the National Institute of Health during the war and the post-war years, and, more recently, of the Research Grants Division of that Institute of the U. S. Public Health Service.

As a modest man of science, Dr. Dyer would undoubtedly have preferred to have the names of his associates and collaborators in the U. S. Public Health Service included in this citation. Yet with all due recognition of their valuable contributions, it was Dyer who consistently devoted most of his scientific career to the

advancement of our knowledge of the rickettsial diseases of the United States, which culminated in the demonstration that the rat flea was the vector responsible for transmission of this so-called "murine typhus" to human beings.

Dr. Dyer's unusual administrative abilities and scientific distinction led ultimately to his appointment as Director of the National Institute of Health. In this capacity he greatly expanded the physical facilities of that agency and broadened the scope of its research programs in many directions. The scientific contributions of the National Institute of Health, especially during the period of the war, have never been adequately recognized by our Government or by the people of this country. Under Dr. Dyer's leadership during the war years, the Institute concentrated all its resources upon the advancement of scientific knowledge important for the war effort and unselfishly contributed its labors to the common effort in collaboration with the research services of the armed forces, the Committee on Medical Research of the National Research Council, the Office of Scientific Research and Development, and many other official and nonofficial scientific agencies. Throughout the war, the important scientific contributions of the Institute were pooled with those of others without thought of reward or even recognition. It is therefore not surprising that they remain unheralded.

Shortly after the end of the war and the termination of the wartime Office of Scientific Research and Development, the Congress continued an important program of financial assistance to medical research with annual appropriations allocated to teaching institutions and research centers of the country through the U. S. Public Health Service. As Director of the National Institute of Health, it was Dr. Dyer's responsibility to devise the operational organization for the study of hundreds of applications for the support of research from scientific investigators and institutions throughout the country, to evaluate their relative merit and to determine the reasonableness of their financial needs. This was accomplished through the utilization of the National Advisory Health Council, consisting of eminent experts in the various medical sciences, together with representatives of the research divisions of each of the armed services and other government agencies.

The National Advisory Health Council is in turn served by Scientific Study Sections for each of the major divisions of medical research. These Study Sections, which include some of the best scientific minds in this

country with a fair measure of geographic representation, study in detail all applications for grants-in-aid for research projects in their respective fields, and recommend appropriate action to the National Council.

The remarkable efficiency with which these applications of extraordinary number and complexity have been processed by the staff of the Research Grants Division of the National Institute of Health, and the effective and impartial manner in which millions of dollars are awarded annually by this Division to support and stimulate medical research throughout the country and to train hundreds of young investigators under a broad program of fellowships, has captured the admiration of the American Public Health Association.

In making this Award to Dr. Dyer, the Association wishes to bring these extraordinary services of a man and of a great federal agency to the attention of the Congress and of the people of the United States.

To Martha M. Eliot, M.D., for her outstanding administrative achievement in the organization and operation of the Emergency Maternal and Infant Care Program.

For more than two decades, Dr. Martha M. Eliot has been a courageous and inspiring leader for improvement in standards of medical care for mothers and infants. As Director of the Division of Child and Maternal Health, Children's Bureau, U. S. Department of Labor, and subsequently as Assistant and Associate Chief of the Bureau, she has been a militant advocate of increasing government participation in the improvement of health services throughout the nation.

The passage of the Social Security Act of 1935 with the allotment of federal funds to the states for the provision of direct services brought new responsibilities and new opportunities. It is impossible to evaluate fully at this time the effect of the new services made possible by these funds upon the health of mothers and children throughout the nation. It is not without significance, however, that during this period maternal and infant mortality rates dropped sharply. One cannot look at these years of achievement without seeing in them a continuing theme, a calm and determined insistence that a better quality of care could and must be available to all mothers and children.

Early in the war, it became apparent that, among the many problems resulting from the dislocation of populations and the development of large military establishments distant from medical centers, medical services for

mothers and children were not being maintained at a satisfactory level. This difficulty was further aggravated by the depletion of the limited medical resources of many of these communities, inevitable in a country at war.

The rapidly increasing birth rate associated with the war made increasing demands for obstetrical and pediatric services for the wives and children of service men, all too frequently in communities where these services were at a low level. Martha Eliot was quick to recognize the need for new methods to meet these new problems. Funds allocated to the states for general maternal and child hygiene were promptly diverted to meet this emergency need. Out of this beginning grew a nation-wide Emergency Maternal and Infant Care program, organized and operated by Dr. Eliot, to provide adequate medical service for the wives and infants of service men of the four lowest pay-grades, financed through generous appropriations by the Congress.

This huge program was extraordinarily difficult to administer, for the need for quick action did not permit slow and cautious planning or the leisurely arbitration of differences of opinion among the many interested groups. A new pattern for efficient coöperation between government and hospitals and physicians and community agencies was developed, which worked.

As a contribution to the mental health and the morale of the men in the armed forces as well as their families, it made a unique contribution to the success of our war effort. Millions of mothers and babies benefited by the program. Quite possibly, the greatest good that history will attribute to the program will be the demonstration of the possibilities of government coöperation with hospitals and with physicians and nurses in the provision of good medical service.

It is not surprising that other nations and various international groups have called upon Dr. Eliot for advice and counsel. She gives unstintingly of herself, not only for the solution of post-war problems at home, but also through the United Nations Childrens Emergency Fund and the World Health Organization, to the problems of the mothers and children of war-ridden countries throughout the world.

On this occasion, the American Public Health Association has selected Dr. Martha M. Eliot for a Lasker Award for 1948, in appreciation of distinguished administrative achievement in organizing and administering the Emergency Medical and Infant Care program and the skill with which she enlisted the support of the medical and public health

professions on behalf of this national project.

In making this award, it is the hope of the Association that it may call to the attention of the approximately 14,500,000 veterans of World War II and of the people of this nation the unrepayable debt which they owe to this woman.

To Selman A. Waksman, Ph.D., and René J. Dubos, M.D., for outstanding scientific achievement in studies of the antibiotic properties of soil bacteria, especially streptomycin.

The value of man's health and well-being of fundamental research is well exemplified by the researches of Selman A. Waksman and of René J. Dubos, recognized throughout the world for their outstanding contributions to science.

Their studies on the relations of association and antagonism of mixed microbiological populations of the soil have not only contributed to our basic knowledge of bacterial metabolism, but also have demonstrated the antibiotic properties of soil bacteria of immediate value to man.

Dr. René J. Dubos, by applying the principle of enrichment of soil with pathogenic bacteria, isolated a spore-forming bacterium capable of bringing about lysis of certain Gram-positive organisms. He first isolated from the spore-forming bacteria specific crystalline substances such as tyrothricin that are powerful bacterial antagonists, thus contributing materially to the subsequent development in the field of antibiotics.

Dr. Selman A. Waksman's studies on the microorganisms of the soil have led to the discovery of a host of antibiotics, among them streptomycin, one of the most potent available to medicine today. It has permitted successful treatment of diseases due to bacteria which are resistant to penicillin. It also affects the growth and viability of the tubercle bacillus and favorably influences the course of some clinical varieties of human tuberculosis.

The studies of these scientists have again emphasized the importance of fundamental research in that, by increasing our knowledge

concerning the activities of soil organisms, they have at the same time elucidated roles which microorganisms can play in maintaining the health of man.

To Department of Medicine and Surgery, Veterans Administration, and especially to Drs. Paul R. Hawley and Paul B. Magnuson, in recognition of the efficient program developed by them to provide modern medical care for the millions of veterans who helped in the defense of America during World War II.

Undaunted by the universal lack of medical personnel and the tremendous problems of America's post-war demobilization, the Veterans Administration enlisted the wholehearted cooperation and assistance of the entire medical profession and provided for our veterans the best medical attention and care available anywhere in the world. Modern medical facilities were assembled, efficient hospitals and clinics were established throughout the nation, and, with the aid of a committee of the Deans of the Medical Schools, a permanent medical staff of extraordinary ability was recruited.

Today, many Veterans Hospitals are affiliated with medical schools and maintain standards of medical service comparable with those of the best teaching institutions. This great demonstration of efficient medical service provides an opportunity to test out under practical conditions new methods and procedures which should help in the eventual development of a more effective program of medical care and public health in the entire country.

The American Public Health Association has selected the Department of Medicine and Surgery of the Veterans Administration and its former chief medical director, Dr. Paul R. Hawley and its present medical director, Dr. Paul B. Magnuson for a Lasker Award of 1948 in recognition of extraordinary accomplishments on behalf of more than 18,750,000 veterans, and their significant contributions to medical administration in America.

ASSOCIATION NEWS

OFFICERS, 1948-1949

President—Charles F. Wilinsky, M.D., Boston, Mass.

President-Elect—Lowell J. Reed, Ph.D., Baltimore, Md.

Vice-Presidents:

Guillermo Arbona, M.D., Santurce, P.R.

Albert E. Berry, Ph.D., Toronto, Ont., Canada

Florence R. Sabin, M.D., Denver, Colo.

Treasurer—Louis I. Dublin, Ph.D., New York, N. Y.

Executive Secretary—Reginald M. Atwater, M.D., New York, N. Y.

Chairman of Executive Board—Hugh R. Leavell, M.D., Boston, Mass.

New Members of Executive Board:

Leona Baumgartner, M.D., New York, N. Y.

Thomas F. Sellers, M.D., Atlanta, Ga.

CHARLES F. WILINSKY, M.D., PRESIDENT OF THE AMERICAN PUBLIC HEALTH ASSOCIATION

Dr. Charles F. Wilinsky of Boston, the Director of Beth Israel Hospital and Deputy Health Commissioner for the City of Boston, assumed the Presidency of the Association at the close of the 76th Annual Meeting in Boston on November 12, having served as President-Elect since 1947.

Dr. Wilinsky, who is a native of Warsaw, Poland, was brought to the United States at the age of ten years by his parents. He was educated in the public schools of Springfield and Lowell, Mass., and received his medical degree in Baltimore in 1904. Harvard University gave him an honorary A.M. in 1941.

Dr. Wilinsky began the general practice of medicine in 1904 in Boston and became a school physician in the Boston Health Department in 1909, advancing to the ranks of medical inspector and district health officer to become the organizer and director of the Blossom Street Health Unit in 1916. Since 1922 Dr. Wilinsky has served as Director of Boston's health centers and Deputy Commissioner since 1925. He

has been Director of Beth Israel Hospital since 1928 and has occupied many positions of distinction in the field of hospital administration in the Massachusetts Hospital Association, the New

CHARLES F. WILINSKY, M.D.

England Hospital Assembly, and the American Hospital Association.

Dr. Wilinsky, who has been a member of the American Public Health Association since 1922, has served on program committees, standing committees, special committees, the Executive Board, and the Governing Council. He was Chairman of the Section on Child Hygiene in 1931 and was made President-Elect in October, 1947.

There is hardly a medical or public health activity in Boston, in Massachusetts, or in New England with which Dr. Wilinsky has not been actively identified and his influence has been felt nationally through membership in the Advisory Council of the U. S. Public Health Service and of the Medical Advisory Board of the American National Red Cross.

In speaking editorially of Dr. Wilinsky as a successor of Lemuel Shattuck in Massachusetts, the *Boston Globe* on November 9 said "For 38 years Dr. Wilinsky has been part of Boston's health service. He has combined several careers, doing each of them superbly, as physician, public health official, and hospital administrator. In addition, his imagination and ability to bring scattered agencies into a united purpose have been serving not only the great city but the entire country by the example offered in Boston. . . . Co-operation with many private health agencies has been achieved by Dr. Wilinsky's skill at producing harmony in good works. Both public and private workers for the physical well-being of the community are finding the way to pull together for the common good."

SEDGWICK MEMORIAL MEDAL TO DR. WOLMAN FOR 1948

THE Sedgwick Memorial Medal for 1948 was awarded to Abel Wolman, Dr. Eng., Professor of Sanitary Engi-

neering in the School of Hygiene and Public Health, and the School of Engineering, The Johns Hopkins University, on November 9, during the Seventy-sixth Annual Meeting of the American Public Health Association in Boston. James S. Simmons, M.D., Dean of the Harvard School of Public Health, and Chairman of the Sedgwick Memorial Award Committee, made the presentation. In his presentation, Dean Simmons gave the following citation:

"Since the Sedgwick Memorial Medal was first awarded in 1929 there have been seventeen recipients selected for their distinguished service in public health. The special interests of those recognized have included epidemiology, teaching, laboratory studies, and administration. In 1948 we honor an engineer and a sanitarian, representative of the kind of person in whose training William Thompson Sedgwick excelled. Sedgwick was always described in *Who's Who* as a sanitarian, and to the development of

ABEL WOLMAN, DR. ENG.

this field of public health he gave his life.

"Abel Wolman is a native of Baltimore where he spent a professional life which now has national and international influence. He began his distinguished career as an assistant engineer in the U. S. Public Health Service in 1913. Nine years later, after serving his own state in junior positions, he was appointed Chief Engineer in the Maryland State Department of Health, a position he held from 1922 to 1939. His influence as a teacher was notable from his early years, and for a decade he has served as Professor of Sanitary Engineering in the School of Hygiene and Public Health of Johns Hopkins University as well as in the School of Engineering at Johns Hopkins, and as lecturer in other universities. Both through his teaching and through his consultative services his influence has been felt across the continent and abroad, through the students whom he has trained and through the leaders he has inspired in visits made overseas.

"Even two departments of a great university have been unable to contain all of Abel Wolman's energies, and his public service has been felt in posts such as Chairman of the Maryland State Planning Commission and Chairman of the Advisory Committee on Sanitary Engineering of the National Research Council. His contributions to numerous professional societies are evident in such organizations as the American Society of Civil Engineers and the American Association for the Advancement of Science. For 17 years he was Editor in Chief of the *Journal of the American Water Works Association*, and in 1942 he served as President of that Association. Most notable have been his contributions through the American Public Health Association which he served as President from 1938 to 1939 and as Chairman of the Executive Board from 1939 to 1948. He also served as first Chairman

of the Committee on Research and Standards. More recently he has been consultant to the Atomic Energy Commission. If one were to list in detail all his connections it would spell out other reasons which have led the committee to make this unanimous decision.

"Even more important, however, is the man Abel Wolman himself. His career illustrates the kind of public service which Professor Sedgwick held in the highest esteem and which was so well illustrated in his own life. Wolman's influence on students has been like Sedgwick's. There has been a similar overflowing of teaching into the practical aspects of community life, a generous and wise giving of himself to causes larger than himself and of which he became a part. The clarity of his thoughts has been notable. His wisdom and statesmanship are of rare quality and, in conference, his word generally keynotes ultimate conclusions. He has not hesitated to take his stand on critical issues or to espouse unpopular causes. The ready acceptance of his leadership reflects the sureness of his position. It also carries recognition of the quality and character that mark a man of distinguished ability.

"In the name of William T. Sedgwick and of the American Public Health Association, I therefore hand to you Professor Wolman the Sedgwick Memorial Medal for distinguished service in public health."

Dr. Wolman, in accepting the Award, made the following response:

"The much quoted aphorism of John Donne that 'no man is an Iland, intire of itselfe' must have been uppermost in the minds of the Committee on the Sedgwick Memorial Award when they selected me as the recipient for 1948. I like to believe that the committee, in making this choice, is giving due honor to that professional group, the sanitary engineer, which has labored so long and so successfully in the public

health field. My limited contributions to the prevention of disease were possible only because of the support and inspiration of my associates. For all of them I accept this award with en-

thusiasm. That my name is permanently associated with it, I shall cherish forever, even though I cannot help but put it down as one of the pleasurable accidents of history."

APPLICANTS FOR MEMBERSHIP

The following individuals have applied for membership in the Association. They have requested affiliation with the sections indicated.

Health Officers Section

- Kenneth O. Courtney, M.D.C.M., D.T.M.&H., Box 383, Balboa Heights, Canal Zone, Asst. to Chief Health Officer, Canal Zone Health Dept.
- Jack B. Eason, M.D., M.S.P.H., 551 City Hall, Spokane, Wash., City Health Officer
- Paul W. Hughes, M.D., M.P.H., Alachua County Health Dept., Box 491, Gainesville, Fla., Asst. Director, State Board of Health Training Center.
- Charles H. Miller, Jr., M.D., M.S.P.H., Golconda, Ill., Medical Director, Quadri-County Health Dept.
- David E. Olsson, M.H.A., Rt. 1, Box 46, 2241 Ensenada Way, San Mateo, Calif., Administrative Resident, San Jose Hospital
- William A. Smith, M.D., State Board of Health, Raleigh, N. C., Director of Tuberculosis Control
- Alvin Sweeney, M.D., Gallinger Municipal Hospital, Washington, D. C., Superintendent
- Enrique Villalobos-Carranza, M.D., Alcanfores 165, Miraflores, Lima, Peru, S. A., Medico-jefe, Departamento de Malaria, Direccion General de Salud Publica

Laboratory Section

- Thayer W. Burnham, M.S., 1012 W. Dayton St., Madison, Wis., Director, Laboratory Division, Dept. of Public Health
- Maryelizabeth Powers, 2240 Everett No., Seattle 2, Wash., Bacteriologist, State Dept. of Health
- J. Cecil Rhodes, M.S., Hillside Ave. & Johnson St., Jenkintown, Pa., Director and Owner, Medical Arts Laboratory
- Walter E. Ward, M.D., Ph.D., Cutter Laboratories, Berkeley, Calif., Medical Director

Vital Statistics Section

- Lucille Amos, M.A., 240 S. 4th St., Minneapolis, Minn., Reporting Methods Analyst, Tuberculosis Control Division, U. S. Public Health Service

Margaret W. Chamberlin, 300 Oak Vue Ave., Concord, Calif., Senior Public Health Analyst, Division of Laboratories, State Health Dept.

Colin W. Churchill, Johns Hopkins Hospital, Baltimore 5, Md., Director of Employer Relations and Assistant Professor of Public Health Administration

Harry W. Clark, Jr., M.A., State Health Dept., State Office Bldg., Albany, N. Y., Junior Statistician

Claire E. Condell, 86 Malvern St., Melrose 76, Mass., Asst. Biometrician, State Dept. of Public Health

Catherine M. Corcoran, Health Dept., 116 Temple St., Los Angeles 12, Calif., Reporting Methods Analyst, U. S. Public Health Service

Ellen C. Garges, 2950 Northampton St., N.W., Washington 15, D. C., Statistician, Tuberculosis Control Division, U. S. Public Health Service

Herbert F. Hirsche, M.P.H., 12 Chelsea Lane, West Hartford 7, Conn., Health Director's Asst. and Director, Bureau of Vital Statistics, Hartford Health Dept.

Philip S. Lawrence, D.Sc., 40 Greenfield Rd., Hagerstown, Md., Biostatistician, Division of Public Health Methods, U. S. Public Health Service

Pauline Lee, Unit P-21, Univ. Village, 29 & Como Aves., S.E., Minneapolis 14, Minn., Formerly Public Health Analyst, State Dept. of Public Health (California)

Lillian S. K. Louis, M.S.P.H., 1060 Koko Head Ave., Honolulu 26, T.H., Statistician, Bureau of Health Statistics, Territorial Dept. of Health

Arthur J. McDowell, 3810 39th St., N.W., Washington 16, D. C., Chief, Statistical Analysis Branch, Medical Statistics Division, Surgeon General's Office, Dept. of the Army

Henry G. Page, M.A., Dominion Bureau of Statistics, Ottawa, Ont., Canada, Chief, Vital Statistics and National Index Section, Health and Welfare Division

Beulah M. Runge, P. O. Box 804, Springfield, Ill., Statistician, Division of Vital Statistics and Records, State Dept. of Public Health
 Edwin T. Tracy, State Dept. of Health, Drawer K., Sta. A., Hartford, Conn., Asst. Director of Vital Statistics
 Vera E. Troyer, 944 South First St., Springfield, Ill., Local Health Activities Statistician, State Dept. of Public Health
 William E. Uzzell, M.A., 848 Amsterdam Ave., N.E., Atlanta, Ga., Chief Statistician, Central Statistical Unit, State Dept. of Health
 Robert L. Ware, M.D., 2625 N. 18th St., Arlington, Va., Director, Medical Statistics Division, Bureau of Medicine and Surgery, Navy Dept.

Engineering Section

Alfred Baker, Box 352, Ketchikan, Alaska, Sanitarian, Territorial Dept. of Health
 Oliver H. Johnson, 1504 Fisk, Pullman, Wash., College Sanitarian, Washington State College
 Major Raymond J. Karpen, M.S.C., 615 22 St., N.W., Washington, D. C., Sanitary Engineer, Preventive Medicine Division, U. S. Army
 John A. Petsche, C.E., 10814 Penfield Ave., Cleveland 5, Ohio, Village Engineer, Cuyahoga Heights Village
 Donald L. Snow, M.S., 3950 Langley Ct., N.W., Washington 16, D. C., Sanitary Engineer, U. S. Public Health Service

Food and Nutrition Section

Eloise S. Cofer, M.S., Ogleboy Hall, Morgantown, W. Va., Specialist, Foods and Nutrition, Agriculture Extension Service
 Evelyn H. McDonald, M.S., 48 West 138 St., Apt. 11E, New York, N. Y., Health Education Asst., Bureau of Health Education, Dept. of Health

Maternal and Child Health Section

Audrey A. Bill, M.D., M.P.H., Old Sudbury Rd., Wayland, Mass., Student, Harvard School of Public Health
 Marion S. Dressler, M.D., 1165 Birch St., Denver, Colo., Director, Crippled Children's Section, State Health Dept.
 Margaret A. Losty, 201 West 16 St., New York, N. Y., Consultant Public Health Nurse, Maternity and Newborn Services, Dept. of Health
 B. Frederic Skinner, Ph.D., 8 Ellsworth Ave., Cambridge, Mass., Professor of Psychology, Harvard University
 June L. Triplett, Courthouse, Owatonna, Minn., Public Health Nurse, Steele County Public Health Nursing Service

Public Health Education Section

Edward A. Benjamin, M.S.P.H., 1910 Vermont Ave., N.W., Washington, D. C., Health Education Consultant, U. S. Public Health Service
 Carmen F. del Rosario, 311 Greene St., New Haven, Conn., Student, Yale University
 Lynde Fales, Box 1058, Juneau, Alaska, Health Education Technician, Territorial Dept. of Health

John T. Morrison, M.D., 8 Oak Lane, Mountain Lakes, N. J., Asso. to Director, Rural Hospital Division, Commonwealth Fund

Fern E. Snedder, 2511 Hearst Ave., Berkeley 2, Calif., Asso. in Medical Care Administration, School of Public Health, Univ. of California

DIRECTORY OF PUBLIC HEALTH STATISTICIANS

The Vital Statistics Section of the Association announces publication of the *Directory of Public Health Statisticians*, the fourth edition of what was known previously as the *Vital Statistics Directory*.

This Directory contains the names of 1,300 persons actively engaged in the collection, processing, analysis, or publication of public health statistics, including vital statistics and medical sta-

tistics. A copy of the *Directory* was sent to each member of the Vital Statistics Section without charge. It sells to non-members for \$1.00.

The *Directory of Public Health Statisticians* was compiled with the assistance of 63 key persons in the United States and Canada, under the direction of the Vital Statistics Section's Committee on Membership and Directory, Iwao M. Moriyama, Ph.D., *Chairman*.

EMPLOYMENT SERVICE

The following pages present information for those seeking qualified public health personnel and for those seeking positions in public health.

This is a service of the Association conducted without expense to the employer or employee.

Address all correspondence to the Employment Service, A.P.H.A., 1790 Broadway, New York 19, N. Y., unless otherwise specified.

(Supplemental to list in November Journal)

NEWS FROM THE FIELD

ROCKY MOUNTAIN CONFERENCE ON LOCAL HEALTH UNITS

A second five state regional Conference on Local Health Units was held in Salt Lake City on October 6 and 7. Attended by 71 persons representing League of Women Voters, Farm Bureau, Home Economics Association, Congress of Parents and Teachers, Junior League, Junior Chamber of Commerce, Federation of Labor, as well as state medical societies, health committees, tuberculosis associations, agricultural extension services, and health departments, it served to generate the power that will carry the message of expanded local health protective services over the transmission lines of every valley in the five states of Colorado, Idaho, Montana, Utah, and Wyoming.

Utah as the host state had the largest representation of 21 persons; Idaho had 14 and far outstripped any of the others in the broadness of its representation; Colorado's delegation numbered 10; Montana and Wyoming each sent 4 persons. Eighteen special guests and resource persons included the regional directors of the Federal Security Agency and of the American Red Cross, the health officer and director of local health administration of Oregon, and New Mexico's director of local health administration.

The Conference, requested by the respective state health officers who selected and captained their state teams, was sponsored by the National Advisory Committee on Local Health Units of the National Health Council. It was in general charge of the Council's Associate Director, John W. Ferree, M.D., and its Assistant Director for Community Organization, S. S. Lifson. Haven Emerson, M.D., father of *Local Health Units for the Nation*, was present to give the

background of the program and to summarize the Conference. The A.P.H.A.'s former director and associate director of field service, Carl E. Buck, Dr.P.H., and George T. Palmer, Dr.P.H., respectively were present for consultation and advice.

Following the pattern set by the Indiana Conference in April, this Conference devoted one day to committee work on four major problem areas in extending health services. Based on the cross-pollination of these problem committees, the second day was concerned with state problems, each state delegation sitting as a state committee.

Each state committee made a report to the whole Conference on the program it would promote in its own state. Colorado, for example, has a master plan for 13 health jurisdictions within the state which it will work toward securing through necessary legislation, through securing adequate salaries to attract personnel and through educational work with citizen groups. Colorado now has 20 counties and 65 per cent of the population served through eight health jurisdictions of one or more counties. In these units there are three health officer vacancies and 22 of 36 public health nursing positions are unfilled. This state suggested the use of teams of professional workers to set up demonstrations of local health services in communities as a community education technique.

The Idaho Committee reported its intention to work for the organization of six health jurisdictions within the state as recommended in *Local Health Units for the Nation*, and now official with the health department. This state has made a particular effort to draw into the program the widest possible variety of participation by citizen and voluntary health agencies. The state group ex-

pressed its determination to proceed with the completion of the state plan. It also went on record as favoring co-operation among the Rocky Mountain states in supporting the medical schools of Colorado and Utah, particularly for the training of public health physicians.

The Montana group reported an educational program in the state to inform citizens of the significance of the permissive health unit law passed in 1945. About 15 voluntary county health councils have been formed in the state due largely to the influence of the State Health Planning Committee.

Utah's group reported its chief need to be a state plan formulated and publicized by the State Board of Health, and made a specific recommendation that a carefully selected committee study the problem, and with technical assistance, formulate a plan, develop a state health council, and encourage local community councils. Small units of government without sufficient population and resources which are attempting to maintain separate public health services were recognized by this group as a fundamental obstacle.

The Wyoming group reported a plan to support permissive health unit legislation. Upon passage of the Act, it is hoped to set up public health units in six cities which will be used as the nuclei for district health units. In addition, rural health centers in four towns are projected, centers that will be directed in the early stages from the State Health Department.

The Conference, on recommendation of its separate problem or state committees, adopted a number of recommendations. Some of these are summarized as follows:

1. A master plan for the development of local health services should be adopted and published by the state health authority.
2. Where necessary, legislation should be developed providing for county and multi-

ple county health units including the cities of the county.

3. Local health departments should be so organized as to have fiscal and other administrative control within the department, operating on the basis of standards approved by the state health authority.
4. Additional federal funds, such as provided for in S 2189, should be made available as a further means of financing local health departments.
5. The development of state and local health councils is the chief means at hand for creating aggressive professional and lay leadership. Such councils should include geographic, agency—voluntary, public, professional, and citizen—and personal representation, and should use existing organizations in evolving a program.
6. In order to attract and retain qualified personnel in the field of public health, public health physicians should be recognized as specialists on the same plans as other medical specialists, and other professional groups should be similarly recognized as specialists, public health workers should be given adequate facilities and salaries commensurate with their services to the community and comparable to similar training and responsibility of professional workers in other fields, reasonable opportunity for professional and financial advancement should be provided and inservice training made available.

As a part of the problem of meeting the serious shortage of professional personnel suffered by each of the states, Dr. Florence R. Sabin, Chairman and motive power of the Colorado State Health Planning Committee, and now Manager of Denver's Health and Charity, reported tentative conversations among the separate state governors and the chancellors of the Universities of Colorado and Utah whereby their medical schools would be regional rather than state schools receiving official support from the states without medical schools on the basis of a formula to be worked out. The Idaho state group voted its complete support of such a plan and the entire Conference voted its only formal resolution on this subject as follows:

"Resolved that the Rocky Mountain Conference on Local Health Units endorses the

principles of inter-state coöperation in the establishment and development of professional training in fields which require greater personnel and financial support than can adequately and reasonably be provided by any single state in this region."

DIVISION OF AIR POLLUTION CONTROL IN PHILADELPHIA

In June, 1948, the Division of Air Pollution Control, Department of Public Health of Philadelphia, Pa., was established. The ordinance establishing the Division also prohibits certain practices which might be contributory to air pollution and requires that the Chief of the Division be an engineer with training and experience in design, construction, and operation of fuel-burning equipment and industrial processes, and also have qualifications at least equal to those required of a licensed professional engineer in Pennsylvania. An Air Pollution Control Board, consisting of seven members is also established.

SOUTHERN BRANCH A.P.H.A. PLANS CONSTITUTIONAL AMENDMENT

George A. Denison, M.D., P.O. Box 2591, Birmingham, Ala., Secretary-Treasurer of the Southern Branch, American Public Health Association, notifies the members of the Southern Branch through this notice of a proposed amendment to Article IV of the Constitution of the Southern Branch which would add to the list of officers "one delegate to the American Public Health Association." According to Dr. Denison this is to correct an omission in the original draft of the Constitution.

It is expected that the amendment will be voted on at the next meeting of the Southern Branch which will take place in Dallas, Tex., April 14-16, 1949.

CLEARING HOUSE OF CHILD LIFE RESEARCH

The U. S. Children's Bureau has set up a Clearing House for Research in Child Life as a center for information on

current research being undertaken by the various disciplines in the field of child life. As an initial activity the clearing house will canvass investigators in various fields for reports on current research which will be summarized in an information bulletin in 1949. This service was set up at the request of scientists who feel the need for a center that will promote collaboration and interchange of information. Clara E. Councell is director of the clearing house under the general supervision of the Bureau's Associate Chief, Martha M. Eliot, M.D.

AMERICAN INSTITUTE OF NUTRITION AWARDS

The American Institute of Nutrition announces three awards to be made at its annual meeting next spring. The Mead Johnson Co. award of \$1,000 will be given to the laboratory (non-clinical) or clinical research worker in the United States or Canada who has published during 1948 the most meritorious scientific report dealing with the field of the B-complex vitamins. While the award will be given primarily for publication of specific papers, it may be made to a worker for contributions over an extended period.

The Borden Award in Nutrition, \$1,000 and a gold medal, will be given for distinctive research by investigators in the United States and Canada which has emphasized the nutritive significance of the components of milk or of dairy products. The award will be made primarily for publication of specific papers.

The Osborne and Mendel Award of \$1,000, established by the Nutrition Foundation, Inc., for outstanding accomplishments in the general field of exploratory research in the science of nutrition, will be given to the investigator who is judged to have made the most significant published contribution in the year. While preference will be given to research workers in the United States

and Canada, investigators in other countries are not excluded.

Nominations must be in the hands of the chairman of the nominating committee by January 15, 1949. They should be accompanied by such data relative to the accomplishment of the nominee and his research as will facilitate the task of the committee of judges. Nominating committee chairman for the Mead Johnson Award is Harold H. Williams, Cornell University, Ithaca, N. Y.; for the Borden Award, James M. Orten, Wayne University College of Medicine, Detroit 26, and for the Osborne and Mendel Award, D. W. Woolley, Rockefeller Institute for Medical Research, New York.

NEW YORK LOCAL HEALTH OFFICERS ORGANIZE

Upstate New York full-time county and city health officers recently organized themselves into a Conference of County and City Health Officers, membership on which is limited to physicians doing full-time public health work in city or county departments of health. The object of this group is to (1) discuss administrative and other problems which arise in the program of the various full-time local departments of health; (2) to secure better coöperation between the State Health Department and local city and county departments.

Officers elected at the first meeting in May are:

Chairman—Dr. William A. Holla, Commissioner of Health, Westchester County

Vice-Chairman—Dr. C. A. Sargent, Commissioner of Health, Syracuse

Secretary-Treasurer—Dr. F. Robert Freckleton, Deputy Commissioner of Health, Rensselaer County

MINNESOTA PUBLIC HEALTH CONFERENCE MEETS

The Minnesota Public Health Conference held its second annual meeting in St. Paul, October 8, 1948. Guest speakers included Katherine F. Lenroot,

Chief, U. S. Children's Bureau; Alma Haupt, Director, Nursing Bureau, Metropolitan Life Insurance Company; Dr. Charles C. Wilson, Professor of Education and Public Health, Yale University; and R. W. Hart, District Engineer, U. S. Public Health Service, District No. 7 (Kansas City, Mo.). An honorary membership was presented to Dr. C. L. Scofield, of Benson, Minnesota, who has practised medicine in rural Minnesota for 64 years. The Conference which now has 220 active members, is applying for A.P.H.A. affiliation.

S. P. Kingston, Public Health Engineer of Rochester, was elected president for the coming year.

BOXING COMMISSION

New York State has enacted a law creating a nine member Medical Advisory Board to the State Boxing Commission in an effort to make boxing and wrestling less hazardous than the 11 deaths in 1946, 9 in 1947, and 12 in 1948 indicate. This board will formulate, for putting into effect by the Boxing Commission, new standards and regulations for the pre- and post-bout examination of boxers and wrestlers, and will institute other medical measures designed to prevent fatalities. Frank R. Ferlaine, M.D., attending physician, New York Post Graduate Medical School and Hospital, is Chairman.

CHLOROMYCETIN CLAIMED TO BE EFFECTIVE IN ROCKY MOUNTAIN SPOTTED FEVER TREATMENT

Maurice C. Pincoffs, M.D., of the Department of Medicine at the University of Maryland, Baltimore, reported late in October at the Army Medical Center in Washington on the treatment of 15 cases of Rocky Mountain spotted fever at the University Hospital. Chloromycetin treatment was begun from 3 to 11 days following the infection. Dr. Pincoffs believed the results to be definitely better than PABA. The

series of cases showed something over 2 days' interval to bring temperature to normal compared with 16 days in the average untreated case.

Joseph E. Smadel, M.D., also reported progress in combating scrub typhus and epidemic and murine typhus with chloromycetin.

NOBEL PRIZE IN MEDICINE TO DR. PAUL MUELLER

It was announced in Stockholm, Sweden, on October 28 that Dr. Paul Mueller of Basle, Switzerland, had been awarded the 1948 Nobel Prize in Medicine in recognition of his discovery of the insecticidal powers of DDT.

According to the report, the Award will amount to about \$44,000 and was to be presented on December 10.

DDT, which was first produced in 1874, was put to its present use in 1939 when Dr. Mueller at the Geigy Drug Industries Company in Basle discovered its insect killing properties.

Dr. Mueller who is 48 years of age has served since the age of 25 with the Geigy Laboratories with a principal interest in synthetic tanning substances. He visited the United States in 1945 on invitation of the United States Government. He is a native of Switzerland and received his Doctor's degree at the University of Basle in 1925.

AMERICAN ASSOCIATION OF PUBLIC HEALTH DENTISTS CHANGES MEMBERSHIP REQUIREMENTS

According to Carl L. Sebelius, D.D.S., Secretary of the American Association of Public Health Dentists, the requirements for active membership in the Association were changed during the recent annual meeting in Chicago, September 11-12.

A person is now eligible for active membership in the American Association of Public Health Dentists if the individual is a member of the American Dental Association and is a director or

assistant director of a state dental public health program or is administering or promoting a dental health program on a national, state, or local level.

PENNSYLVANIA PUBLIC HEALTH ASSOCIATION HOLDS ANNUAL MEETING

The 1948 Annual Meeting of the Pennsylvania Public Health Association was held at Williamsport, Pa., October 22-23, under the Presidency of Harriet L. Hartley, M.D., of Philadelphia.

The program included reviews of Pennsylvania's health facilities presented by Roscoe P. Kandle, M.D., Field Director, American Public Health Association and the Director of the Pennsylvania Health Survey which is nearing completion. Pennsylvania's hospital facilities were discussed by Hubley R. Owen, M.D., the Director of Pennsylvania's Hospital Survey and Medical Director of the Philadelphia Board of Education. P. F. Lucchesi, M.D., presented "Organized Medicine and Public Health" from the standpoint of the Commission on Public Health and Preventive Medicine of the Pennsylvania State Medical Society. Merl Greene Colvin, M.D., the County Medical Officer of Lycoming County, reviewed the activities under the present system of Pennsylvania's health laws.

Norris W. Vaux, M.D., Pennsylvania's Secretary of Health, and Honorary President of the Pennsylvania Public Health Association, presided at the Dinner Session at which the speaker was Professor C.-E. A. Winslow, Professor Emeritus of Public Health of Yale University School of Medicine and Editor of the *American Journal of Public Health*. He spoke on "Challenges to Health in Pennsylvania." The Association's Award of Merit was presented by Dr. Hartley to Charles H. Miner, M.D., of Wilkes-Barre, former Secretary of the Pennsylvania State Department of Health.

The second day was devoted to a

panel on venereal disease control under the Chairmanship of Reginald M. Atwater, M.D., Executive Secretary of the American Public Health Association. The participants included Alice DeBenneville, R.N., of the Public Health Nursing Society of Pittsburgh; Alvin Funke, M.D., of the Venereal Disease Clinic in Wilkes-Barre; Norman R. Ingraham, Jr., M.D., Venereal Disease Control Division, Philadelphia Department of Public Health; Roscoe P. Kandle, M.D., Field Director, A.P.H.A., and Robert E. Rothermel, M.D., Assistant Field Director, A.P.H.A.

The new officers of the Association for the coming year include Lorenzo G. Runk, Jr., M.D., of Phillipsburg, Pa., *President*; P. F. Lucchesi, M.D., of Philadelphia, *President-Elect*; and J. Clarence Funk, of Fayetteville, Pa., *Secretary*.

CANADIAN PUBLIC HEALTH ASSOCIATION ADOPTS A.P.H.A. STATEMENTS ON PROFESSIONAL QUALIFICATIONS

"With the hearty approval of the American Public Health Association, the qualifications recommended by that body for all personnel engaged in public health have been adopted by the Canadian Public Health Association, with the necessary changes to meet Canadian needs. Thus, Canadian standards will be generally in accord with standards in the United States. The importance of standards in Canada will be increasingly evident as health services are extended through the application of federal grants for public health." Editorial, *Canad. Pub. Health J.*, Sept., 1948.

NATIONAL INSTITUTES OF HEALTH CRE- ATES MICROBIOLOGICAL INSTITUTE

It is reported that in the present reorganization of the National Institutes of Health, Bethesda, there has been established a Microbiological Institute to conduct basic studies beyond the pur-

view of the Institutes on Cancer, on Heart Disease and on Dental Health. Emphasis will be placed on virus, rickettsial, bacterial, and tropical diseases. According to the *Washington Report on the Medical Sciences*, it is planned that the standardization of biologicals will be transferred to the new Institute. Dr. Victor H. Haas has been appointed director of the new unit. He has previously headed a malaria research project undertaken by NIH in coöperation with the University of Tennessee School of Medicine.

DR. SANDOR HORWITZ HONORED ON RE- TIREMENT IN ILLINOIS

At the Annual Conference of City, County, and District Public Health Officers of Illinois held in Springfield, October 25-29, Dr. Sandor Horwitz, State Health Superintendent for District No. 7, including Marshall, Putnam, Stark, Tazewell, and Woodford Counties, was honored at a special luncheon. Dr. Horwitz is retiring as of January 1 after devoting 38 years of service to public health in Illinois.

Speakers at the luncheon included Dr. Henrietta Herbolzheimer, speaking for Dr. Roland R. Cross; State Director of Public Health, as well as B. K. Richardson, Dr. Charles F. Sutton, Maude Carson, R.N., of the Division of Public Health Nursing, and others of Dr. Horwitz' associates. Dr. Horwitz received the gift of a traveling bag to mark the occasion, following which he presented a paper on the treatment of bulbar poliomyelitis.

FLORIDA PUBLIC HEALTH ASSOCIATION

The Florida Public Health Association held its 20th annual meeting in Panama City, October 6 and 7. The registration was more than 250. There was a wide panel of speakers and discussion leaders drawn from state practitioners of public health and related interests as well as out of state leaders.

Senator Claude Pepper was among the main speakers as were the candidates for the state governorship and the state superintendency of public instruction.

Roscoe P. Kandle, M.D., A.P.H.A.'s Field Director, spoke on the "Evaluation of Local Health Services" and W. T. Ingram, the Engineering Field Representative, on "Sanitation Administrative Practices." Other out of state speakers were:

K. Barbara Dormin, Consultant, Diabetes Section, U. S. Public Health Service

Franklin Foote, M.D., Executive Director, National Society for the Prevention of Blindness

John M. Henderson, Professor of Sanitary Science, Columbia University, School of Public Health

Pearl Shalot, Nursing Consultant, Mental Health Division, U. S. Public Health Service

Marjorie Spaulding, Senior Assistant Nurse Officer, City-County Health Department, Winston-Salem, N. C.

Dr. Clair E. Turner, Assistant to President, National Foundation for Infantile Paralysis

The following officers were elected:

President—T. E. Cato, M.D., Miami

First Vice-President—May Pyncheon, Jacksonville

Second Vice-President—Bertha King, Tampa

Secretary—Fred B. Ragland, Jacksonville

Treasurer—Elsie Hyatt, Jacksonville

PERSONALS

LOUIS BAZY, M.D., Chief Surgeon of the French National Railroads, in recognition of the operation endarterectomy which he developed for treating arteriosclerosis, received an Honorary Fellowship from the American College of Surgeons at a Convocation held in the Philharmonic Auditorium of Los Angeles, Calif., on October 22 as the closing ceremony of the 5 day Clinical Congress of the College.

MALCOLM A. BOUTON, M.D., New York District State Health Officer for Fulton and Montgomery Counties, has been appointed Health Commissioner

for the city of Schenectady, effective October 1.

LOUIS D. BROWN, has been appointed Secretary of the Governmental Research Association, 30 Rockefeller Plaza, New York, N. Y., effective September 1.

ANTON J. CARLSON, M.D.,† recently delivered the second annual Margaret Barclay Wilson memorial lecture at Hunter College, New York, on the subject "Diet and the Span of Life."

TORBJOERN O. CASPERSSON, Director of the Institute for Cell Research, Medical Nobel Institute of Stockholm gave the 16th series of Thomas William Salmon Lectures at the New York Academy of Medicine on November 8-10 under the general title, "Cell Function and Cell Growth in Normal and Pathologic Conditions, Studied by Quantitative Cyto-Chemical Procedures."

ERVAL R. COFFEY, M.D.,* Medical Director, U. S. Public Health Service, has taken over his new assignment as Regional Director for the Federal Security Agency in the Regional Office, Washington, D. C.

H. TRENDLEY DEAN, D.D.S.,* is Director of the National Dental Research Institute in the National Institutes of Health, Bethesda, Md. He has hitherto been Director of the Dental Division of the National Institute of Health.

HOWARD ENNES,† on leave as Chief, Extension and Training Section of the Venereal Disease Division, U. S. Public Health Service, is now Director of Public Health Education, Erie County, N. Y., Department of Health. Since September, 1947, he has been Executive Secretary of the Coöperative Studies in the Social and Educational Aspects of Venereal Disease Control, a joint project of the De-

* Fellow A.P.H.A.

† Member A.P.H.A.

partment of Public Health of Yale University and the Venereal Disease Division of the Service.

L. W. FRAME, M.D., on October 1 became Director of the Division of Communicable Disease Control, West Virginia State Department of Health.

JAMES GIBBARD,* who has long served on the staff of the Laboratory of Hygiene, Department of National Health and Welfare, Ottawa, Canada, has been promoted to be Chief of the Laboratory, succeeding R. J. GIBBONS, M.D.,* resigned.

MARGUERITE F. HALL, Ph.D.,* formerly Associate Professor of Public Health Statistics, University of Michigan, Ann Arbor, has been appointed Director of the Bureau of Vital Statistics, New Jersey State Department of Health.

GEORGE HANNA, civil engineer formerly with a Syracuse, N. Y., construction firm has become the city health department's first sanitary engineer.

RALPH H. HEEREN, M.D.,* formerly connected with the Oklahoma City Department of Health, has been appointed Director of Preventable Disease and Venereal Disease in the Iowa State Department of Health, Des Moines, succeeding CARL F. JORDAN, M.D.,* resigned.

LEON H. HETHERINGTON, M.D., on October 1 became Chief of the Division of Tuberculosis Services, Maryland State Department of Health. Dr. Hetherington will administer the four State Sanatoria now under the Department's direction.

E. HAROLD HINMAN, M.D., M.P.H.,* who has been Chief Malariologist of the Tennessee Valley Authority, recently became Director of Public Health at the University of Oklahoma, Norman. The university is developing training programs for public health workers.

JOSEPH HIRSH,* for the past year Acting Director, has been appointed Ex-

ecutive Director of the Research Council on Problems of Alcohol. He has been its Associate Director for the past several years. Mr. Hirsh is the author of "The Problem Drinker," shortly to be published by Duell, Sloan and Pearce.

T. E. HYNSON, M.D.,† of the U. S. Public Health Service, has been assigned to the West Virginia State Department of Health as Acting Director of the Bureau of Venereal Disease Control, serving also as medical officer in charge of the Rapid Treatment Center in South Charleston.

HUGH JACKSON,† has resigned as Director of the Public Charities Association of Pennsylvania to become Executive Vice-President of the Better Business Bureau of New York City. He has been succeeded in Pennsylvania by A. DAVID BOUTERSE, formerly Director of the Ohio Citizens' Council.

SARAH JUDY† has been assigned to the Erie County, N. Y., Department of Health as apprentice Health Educator under the newly developed program of the New York State Department of Health. She was formerly information Specialist with the National Cancer Institute, U. S. Public Health Service.

P. Z. KING, M.D., formerly Chief Medical Officer of the National Department of Health in Nanking, China, has accepted appointment as Head of the Department of Public Health, National Medical College, Shanghai.

HUGO M. KULSTAD, D.D.S.,* is the head of the newly formed Bureau of Dental Health in the California State Department of Public Health.

WARREN W. LACEY, JR., M.D., M.P.H.,* for 3 years District Health Officer of the New York City Health Department, is now Deputy Medical Director of the America Fore Insurance Group. Dr. Lacey served 5 years in the Medi-

* Fellow A.P.H.A.

† Member A.P.H.A.

cal Corps, U. S. Army, and was previously on the staff of the New York State Health Department.

NEWTON W. LARKUM, M.D.,* formerly Pathologist with the Kings Daughters Clinic in Temple, Tex., has been appointed Pathologist at the Easton Hospital, Easton, Pa.

A. LEPORE, became consultant on Maternal and Child Health with the Kanawha-Charleston Health Department, West Virginia. She is a graduate of Lobenstine Clinic School for Nurse Midwives, New York City.

PASCAL F. LUCCHESI, M.D.,† Medical Director and Superintendent of the Philadelphia General Hospital, has received the Strittmatter Award for 1947 "in recognition of his outstanding service to medical education and to the public health of Philadelphia."

ROBERT G. MARQUARDT, M.D., formerly Health Officer for Utica district, New York State Department of Health, has been appointed Syracuse Deputy Health Commissioner, a newly created post.

GEORGE J. NELBACH,* Consultant, New York State Committee on Tuberculosis and Public Health, is teaching a weekly evening course on "Community Organization for Health," at New York University's School of Education.

JEROME PETERSON, M.D., M.P.H.,* New York City, who has recently returned from China where he was Chief of the China Mission of the World Health Organization, has been loaned by the WHO to the Long Island College of Medicine, Brooklyn, as Acting Executive Officer of the Department of Preventive Medicine and Community Health, succeeding THOMAS D. DUBLIN, M.D., DR.P.H.,* who recently became Executive Director of the National Health Council.

FRANCES READ, M.D., was recently appointed Director of the Florida State Board of Health's Bureau of Maternal and Child Health, Jacksonville. She will also direct the mental health program. Dr. Read was formerly Director of the Pediatrics Department, a member of the Medical Board, and Director of Research in Cardiac Clinic, of Johns Hopkins Hospital. MARTHA RONAYNE, formerly with the Iowa State Health Department as Nurse Consultant in the Division of Venereal Disease Control, assumed her position as Educational Director of the Public Health Nursing Association of Des Moines and Polk County, Iowa, on September 15.

GEORGE ROSEN, M.D., M.P.H.,† delivered the Louis Green Memorial Lecture under the auspices of the Montreal Clinical Society on October 27 on "The Idea of Social Medicine in America."

DEAN F. SMILEY, M.D.,* has resigned from the staff of the American Medical Association, Chicago, to become Assistant Secretary of the Association of American Medical Colleges, Chicago, effective September 1.

J. EARL SMITH, M.D.,* who has served as Medical Director of the St. Louis, Mo., Health Division, Communicable Disease Section since 1933, has been appointed Acting Health Commissioner of St. Louis to succeed JOSEPH F. BREDECK, M.D., D.P.H., who died suddenly of a heart attack on October 4.

JOHN C. TALBOT, M.D., has been appointed Assistant Professor of Preventive Medicine, University of California Medical School, San Francisco, and has also been appointed Assistant Dean of the school. He is a graduate of the University in 1939 after which he served in the Army Medical Corps.

CORNELIUS H. TRAEGER, M.D., by reason of a grant from the Milbank Memorial Fund, was appointed Medi-

* Fellow A.P.H.A.

† Member A.P.H.A.

cal Director of the National Multiple Sclerosis Society with headquarters in the New York Academy of Medicine. Dr. Traeger is Attending Physician and co-chief of Arthritis Clinic, the Hospital for Special Surgery and Consulting Attending Physician in Internal Medicine and Chief of Arthritis Clinic, Roosevelt Hospital, both in New York.

JAMES O. WAILS, M.D., M.P.H.,* most recently Worcester, (Mass.) Commissioner of Health, is now epidemiologist and director of the Division of Communicable Disease Control, Oklahoma State Health Department.

PATRICIA WHITE WARREN,† is the new Assistant Executive Secretary of the Hartford Tuberculosis and Public Health Society, Inc., Hartford, Conn. Mrs. Warren, just prior to going to Hartford, helped to organize a successful patient and visitor education program at Rutland Heights Veterans' Hospital in Massachusetts and has had experience in tuberculosis work with local, state, and national organizations.

E. RICHARD WEINERMAN, M.D., M.P.H.,† has joined the staff of the School of Public Health, University of California, Berkeley, as Associate Professor of Medical Economics.

ROBERT S. WESTPHAL, M.D.,* former Deputy Health Officer in Rochester, N. Y., has recently become Health Officer in Riverside County, California.

EDWIN G. WILLIAMS, M.D., of the staff of the U. S. Public Health Service, Washington, D. C., has been transferred to the Office of the Surgeon General in the Sanitary Engineering Division where he is establishing a section on radiological health.

GLADYS R. J. WILSON,† for the past 14 years Supervisor of the Nursing Bureau, New Haven Health Department, has been appointed North At-

lantic Area supervisor of Centers Nurses in the National Blood Program of the American Red Cross, with headquarters in New York City. She will direct nursing phases of the National Blood Program in the North Atlantic Area, including New England, New York, New Jersey, and Delaware.

WILLIAM W. WOOD, M.B.A., has been appointed Chief Coördinator of Public Health Education in the Bureau of Health Information, Massachusetts State Department of Health. His principal task will be the organization of community health services and community education. He was formerly Assistant Director of the Harvard Pediatric Service, Cambridge.

J. G. WOODIN, M.D., is the new director of the Grand Island-Hall County Health Department in Nebraska, succeeding J. C. NEWMAN,† M.D., who resigned in December, 1947. Dr. Woodin is also Grand Island city physician.

RALPH W. G. WYCKOFF, Ph.D.,† left recently for Europe where he is to receive an Honorary Degree from the faculty of medicine of Masaryk University, Brno, Czechoslovakia.

CALIFORNIA STATE DEPARTMENT OF HEALTH, CHANGES IN PERSONNEL:

DOROTHY MERWIN has returned to the Bureau of Public Health Nursing after receiving her Master's Degree in Public Health at the University of Michigan. A general nursing consultant, she has been assigned to the northeastern section of the state.

ALICE HAGELSHAW has also joined the staff as a general nursing consultant, Bureau of Public Health Nursing, assigned the coastal area south of San Francisco.

LUCRETIA SAUNDERS,† formerly of the Indiana State Health Depart-

ment, is now Consultant in Health Education. She will have responsibility for developing health education programs in rural areas where full-time health departments do not exist.

ALCOR BROWNE† is a new member of the Division of Laboratories on assignment to the Division of Local Health Service. His services to local health departments will include help in the recruitment and training of personnel, and assistance in working out problems of laboratory construction, procedures, and equipment.

NORTH DAKOTA STATE HEALTH DEPARTMENT, ADDITIONS TO THE STAFF:

ELEANOR MUMFORD, R.N.,† has succeeded IRENE M. DONOVAN,* who has been Director, Division of Public Health Nursing since 1939.

KENNETH MOSSER, Administrator, Division of Preventable Diseases.

ALLENE SMALL, Nutritionist, Maternal and Child Health Division.

JAMES H. PENCE, D.D.S., Director, Division of Oral Hygiene.

WALTER SWENSON, Ph.D., Director, Section of Mental Hygiene.

Deaths

FREDERICK BOERNER, V.M.D., Associate Professor of Clinical Bacteriology, Graduate Hospital, University of Pennsylvania, died recently (Laboratory Section).

JOSEPH F. BREDECK, M.D., D.P.H., Health Commissioner of the City of St. Louis, Mo., since 1933, died suddenly on October 4 (Health Officers Section).

RALPH TALCOTT FISHER, former Chairman of the Finance Committee of the Alameda County Tuberculosis and Health Association, Calif., died August 7.

ARTHUR L. SULLIVAN, State Food and Drug Commissioner of the Maryland State Department of Health, died suddenly at his home in Baltimore on August 16.

CONFERENCES AND DATES

American College of Physicians. New York, N. Y. March 28-April 1, 1949.

American Public Welfare Association. Chicago, Ill. December 9-10.

American Journal of Public Health

and THE NATION'S HEALTH

Index to Volume 38, 1948

How to Use the INDEX

This is an Index to all the reading matter in the JOURNAL. It is essentially a title and author Index, although occasional subject headings are provided.

Articles, committee reports, and editorials are listed alphabetically according to the key words in the title, with many cross-references.

Editorials are indexed under "Editorials" as well as alphabetically under the key words in the title.

News notes and fillers are indexed under "News from the Field." This section should be searched as supplemental to the title index.

Matters pertaining to the Association are indexed under "American Public Health Association," and "Year Book."

Book reviews are indexed under "Books and Reports."

Obituaries are indexed under "Death Notices."
